Health, Research Projects, *Scientific Research,
*Water Pollution Control, *Water Resources

ABSTRACT

Described are 4501 projects in progress during 1968 under the general headings: Nature of Water; Water Cycle; Water Supply Augmentation and Conservation; Water Quality Management and Control; Water Quality Management and Protection; Water Resources Planning; Resource Data; Engineering Works; and Manpower, Grants and Facilities. Each description outlines the objectives of the project and the procedures being used. The name of the principal investigator and the address of the institution are given, and supporting agencies are identified. There is a subject index, a principal investigator index, a contractor index, and a supporting agency index. (EB)

INTRODUCTION

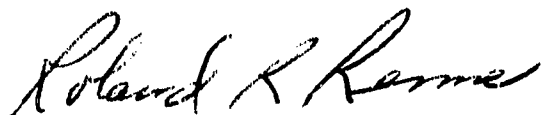

This Volume 4 of the *Water Resources Research Catalog* is published pursuant to the Water Research Act of 1964 (78 Stat. 329 as amended by 80 Stat. 129), whose purposes (as stated in the preamble) are: "In order to assist in assuring the Nation at all times of a supply of water sufficient in quantity and quality to meet the requirements of its expanding population, it is the purpose of the Congress, by this Act, to stimulate, sponsor, provide for, and supplement present programs for the conduct of research, investigations, experiments, and the training of scientists in the field of water and resources which affect water."

The Catalog series, initiated in February, 1965, with Volume 1, Part 1, presents annually summary descriptions of current research on water resources problems. Such information is needed by the Office of Water Resources Research as one of the tools for administration of the program and research support in accordance with the statutory requirement to avoid undesirable duplication of effort. The Catalog also makes readily available to all who are engaged in water-related research, or otherwise concerned with water resources problems, information on what is being done, by whom, and where. Three years of experience demonstrates that availability of this information is valuable to research program administrators, research scientists and engineers, and the users of research results.

Continuing enlargement of research activities, responsive to the magnitude and urgency of water resources problems, makes all the more necessary availability of information on current activities. Volume 4 of the Catalog is one means of providing that.

Appreciation for continuing effective cooperation and support of the Catalog project is expressed to Dr. Bernard B. Berger, Chairman, and to each of the individuals who constitute the membership of the Committee on Water Resources Research of the Federal Council for Science and Technology. They are responsible for the timely provision of informative summaries of 3,824 federally-supported research projects. Appreciation also is expressed to the personnel of the universities, research institutions, state agencies, industrial enterprises, and others who have voluntarily contributed the descriptive summaries of 677 research projects that are wholly supported from non-Federal sources. As in the case of Volume 3, publication of this volume is possible only because of the outstanding cooperation, the special efforts, and the highly skilled performance of the Science Information Exchange in completing its assigned task.

Volume 4 includes description of 4,501 active research projects in comparison with 4,193 in Volume 3 for 1967. This increase generally reflects the expanding interest in water resources research that has taken place and the accompanying research activity. The Catalog lists 5,749 investigators, 781 performing organizations of which 194 are Federal and 587 non-Federal, and 320 supporting organizations of which 31 are Federal and 289 non-Federal.

Roland R. Renne
Director
Office of Water Resources Research

EDITOR'S NOTE

Volume 4 of the *Water Resources Research Catalog* has been prepared at the request of the Office of Water Resources Research, Department of the Interior, by the Science Information Exchange of the Smithsonian Institution as part of its continuing responsibilities as the national cataloging center for current water resources research. It provides information on 4,501 ongoing water resources research projects, supported by both Federal and non-Federal funds, which were collected by the Science Information Exchange through a special solicitation of Federal and non-Federal sources. About 101 additional potential non-Federal sources of water research were queried over those contacted for Volume 3. Also, the director of each of the 51 state water research institutes was requested to submit records for new non-Federal projects.

Included in Volume 4 are reports of research being carried on in the 50 states, the District of Columbia, and Puerto Rico as well as research in about 25 foreign countries. The total of 4,501 summaries in Volume 4 represents an increase of 308 over the number that were listed in Volume 3. However, this should not be construed only as an absolute increase in the amount of research being done, but rather as a combination of increased water research effort plus more complete coverage of existing research not previously registered at the Exchange. At the same time, a more rigorous screening out of inappropriate projects was accomplished by the contributing agencies.

The research listed has been forwarded for inclusion by the supporting agencies. Frequently, several agencies contributed substantially to a single research project, or to various aspects of a single project, and several summaries were received describing essentially the same research. If these similar descriptions could be accurately identified as comprising the same research, there would still remain the problem of deciding which summary best described the research. Thus only projects with identical summaries have been removed. The various supporting sources are identified in every case.

The projects included herein were reviewed, updated, and designated as water resources research by the original source of the material: Federal and state agencies, private industry, academic institutions, private foundations, and individual scientists. The contributors also assigned each summary to one of the nine major water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology (February 1966). The categories define the nine chapters of the Catalog in which the summaries appear. In addition to the summaries of the 4,501 projects, the Catalog contains the following indexes: Subject Index, Investigator Index, Contractor Index, Supporting Agency Index, and an Index of Chapter Definitions. The information which appears in the summaries and indexes was taken directly from the project records as received by the Exchange.

The Subject Index is based on a hierarchy developed by the Science Information Exchange. The index terms are arranged in hierarchies indicating relationships between broader and narrower subject terms. Related terms are thus grouped together under broader terms. The hierarchical term is followed by the project title, a list of about five keywords, and the chapter number of the project. All index terms were selected to emphasize the water aspects of the project.

The indexing is as specific as the language of the project summary, however, as it is hierarchical in nature, a project which deals with "riparian rights" will be indexed to that specific term under a hierarchy consisting of the term "water rights" and the still broader term "legal aspects of water." Thus, one must turn to the high level term "legal aspects of water" to find projects dealing with riparian rights, but he will also find all other legal studies grouped together in the same section. To further aid in locating subject areas, the first high level hierarchical term to appear on a left-hand Subject Index page is also printed in the upper left-hand corner of that page, and the last high level term to appear on the right-hand page will also appear in the upper right-hand corner of that page in dictionary fashion.

The Supporting Agency Index consists of a single alphabetic listing of both Federal and non-Federal sources of support. In view of the large number of state agencies and departments,

they are displayed as a combined group under each state. All investigators cited on the source document are included in the Investigator Index. An asterisk is used to designate the individual specified as principal investigator. However, in some instances it is apparent that the "principal investigator" denoted on the source document is, in fact, a program manager who is not working at the contractor location given in the project summary. The Contractor Index is an alphabetic listing of the performing organization and its location.

All of the indexes in the Catalog were generated by means of a computer, necessitating a limitation of the number of characters available for index terms and caption. Thus, in some instances, abbreviations had to be used.

We hope that the users of this Catalog will advise the Science Information Exchange of any errors of omission or commission that have been made. Also, critiques of this Volume are encouraged so that future editions might best reflect the information therein in a format and with indexes which are most convenient and acceptable to the user.

Monroe E. Freeman, Director
Science Information Exchange

DESCRIPTION OF RESEARCH TASKS

1. NATURE OF WATER

Properties of Water; Aqueous Solutions.

1.0001, THE EFFECT OF SURFACTANTS ON THE AQUEOUS SOLUBILITY OF OXYGEN AND HYDROGEN SULFIDE

R.H. DINIUS, Auburn University, Water Resources Research Inst., Auburn, Alabama 36830

The solubility of oxygen and hydrogen sulfide as effected by surfactants in aqueous systems is being determined. Cationic and anionic surfactants with alkyl groups representing optimum surface activity, wetting ability and the combination of the two properties are being utilized in this investigation. Wet chemical methods are used to determine oxygen and hydrogen sulfide concentrations. The maximum surfactant concentrations used in this investigation correspond to the critical micelle formation concentration.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Auburn University

1.0002, DIFFUSION OF OXYGEN AND HYDROGEN SULFIDE IN WATER AS EFFECTED BY DISSOLVED SURFACTANTS

R.H. DINIUS, Auburn University, Water Resources Research Inst., Auburn, Alabama 36830

The proposed research is to determine and measure the effect of surfactants upon the diffusion coefficients of oxygen and hydrogen sulfide in aqueous solutions of surfactants. A secondary objective is to determine the effect of surfactants on the structure of the near infrared absorption spectra of water. A comparison of the effects of surfactants on both sets of measurements will be made in terms of the molecular size, spatial conformation and charge distribution of the surfactant molecule.

Diffusion coefficients are being measured in terms of concentration change as a function of time across a diaphragm diffusion cell. Oxygen concentrations will be determined with galvanic type cells and H₂S concentrations will be determined via the gas chromatograph.

NIR spectra will be measured in the 0.8 to 1.5 micron range as a function of surfactant concentration.

As a result of initial work with the galvanic type oxygen determination cell an effort is being made to improve its long term stability and like time. The possible effects of the absorption of foreign species on the membrane of the cell upon cell sensitive to oxygen is being determined.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Auburn University

1.0003, DIFFUSIVITY OF OXYGEN AND SULFIDE SPECIES IN AQUEOUS SOLUTIONS

R.H. DINIUS, Auburn University, Graduate School, Auburn, Alabama 36830

The Proposed research has three objectives: 1. Continuation of oxygen diffusivity investigations to determine the effect of solutes (e.g. surfactants and some simpler electrolytes such as phosphates and carbonates) found in waste discharges. 2. Extend the diffusivity studies to sulfide ions in the solution system used above. 3. Continue development work on a continuous, non-

destructive method for measuring hydrogen sulfide concentrations.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Auburn University

1.0004, PATHWAYS OF TRACE ELEMENTS IN ARCTIC LAKE ECOSYSTEMS

R.J. BARSDATE, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735 (AT(04-3)310-4)

This research is a study of the behavior and abundance of trace metals in high latitude lakes. It includes the quantitative determination of Co, Cu, Fe, Mn, and Zn in water, sediments and bio materials by atomic absorption and electrochemical techniques. To assess the role of dissolved organic substances, separations of organic components are being made by gel filtration and solvent extraction, the isolated fractions being tested for complexation ability. Tracer techniques, dialysis, and chromatography will be employed to establish the abundance and strength of complexes in lakes. To determine the effects of complexation by sulfides and organic substances and of the competition between these two systems, several lakes with differing concentrations of dissolved organics and sulfides are being examined.

In addition to the treatment of trace metals, in progress are a general chemical description and classification of high latitude lakes and studies of lake ice and complexation of the major cations.

Observations of the geochemistry of ice include the partition of dissolved substances during freezing, the effects of ice cover on terrestrial run-off and atmospheric fall-out, and the spatial distribution of impurities in ice.

Substantial fractionation of the major cations has been observed during the precipitation of the salts of organic acids. Since similar precipitation occurs in some lakes, this mechanism may influence the natural distribution of Na, K, Cs, Mg, Ca, and Sr. The relative stability and solubility of complexes of these cations with organic acids will be determined by equilibrium dialysis and tracer techniques. Analysis of lake waters will be made to confirm the mechanism and assess its importance.

SUPPORTED BY U.S. Atomic Energy Commission

1.0005, ORGANIC COMPOUNDS IN ALASKA PERMAFROST GROUNDWATER

N.J. BIRKHOLZ, Univ. of Alaska, Inst. of Water Resources Res., College, Alaska 99735

Detection and identification of trace organic compounds in well waters associated with the interior Alaska permafrost regime are being studied using gas and thin layer chromatography and spectra. Surface waters and soil samples are being similarly investigated to the extent that they can clarify the origin of organics at deeper levels. Changes in trace organics will be studied during development of a well.

SUPPORTED BY U.S. Dept. of Interior - F. Water Pol. Ctl

1.0006, THE KINETICS OF MICROBIOLOGICAL MODIFICATION OF ORGANIC SUBSTANCES OCCURRING IN NATURAL WATERS

D.K. BUTTON, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735

1. NATURE OF WATER

We have found large changes in the efficiency of the substrate transport systems of microorganisms with changing external conditions. We propose to examine this phenomenon carefully and to use it as an avenue to study the transport systems of microorganisms which effect the concentration of dilute substrates in a natural environment. We further propose to investigate the kinetics of degradation of the rather stable high molecular weight dissolved organic fraction one can concentrate from most lake and sea water. This will be done using continuous culture techniques.

1.0007, NUCLEAR TECHNIQUES IN SOILS HYDROLOGY, SNOW GAGING, AND RELATED APPLICATIONS

J.L. SMITH, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Berkeley, California (AT(49-11)-2773)

Previous work has been in the field of soils hydrology, construction and use of a snow density gage, water use by plants, and hexadecanol tracing in the application concerned with reducing evaporation. Current studies are concerned with the following:

Effect of Aspect and Cover Upon Snow Accumulation, Metamorphosis, and Melt: The objective of this study is to determine the mathematical relation that exists between the snow condition as determined by the snow gage at the Central Sierra Snow Laboratory and that existing at various locations away from the Laboratory (radius of 5 miles). Hopefully, it will be demonstrated that the centrally located snow gage can be used to determine snow condition at any other point within its area of influence.

Soil Collection and Analysis - This work will continue since the conformation is essential to furnish data on soil hydrologic properties to the water tracing by isotopes study.

Study of Soil Water Movement Under Saturated and Non-saturated Soil Moisture Conditions This is a joint effort with Hazelton Nuclear Science Corporation (see contract AT(04-3)-676. Attempts will be made to measure the movement rate and amounts of water in the soils studied, determine the path and rate of soil water movement in its journey down slope from hilltop to stream, determine water use of vegetation growing on a hillside by using double tracers.

Determination of Water Movement in Plants by Nuclear and Heat Pulse Techniques This study is concerned with water movement in various vegetation indigenous to Sierra Nevada. Areas of concern are the determination of the relation between velocity of water movement in the stems and environmental driving factors such as solar radiation, soil moisture availability, and temperature.

In all instances, isotopes will be a prime tool used in the studies.

SUPPORTED BY U.S. Atomic Energy Commission

1.0008, FILTRATION OF AQUEOUS EFFLUENTS CARRYING EMULSIFIED OILS

S.L. GOREN, Univ. of California, Graduate School, Berkeley, California 94720

A number of aqueous wastes carry micron and submicron droplets of emulsified oils which may affect the quality of the water into which these wastes are discharged. A promising method of separating such emulsions cheaply and thoroughly is to promote coalescence of the dispersed phase by passing the stream through a fibrous mat.

We are studying the coalescence of aqueous emulsions by fibrous media with the aim of elucidating the mechanisms involved and establishing the effectiveness of coalescence as a function of such variables as drop size, fiber size, mat geometry, fluid and surface properties, flow rate, etc. Emulsions well characterized as to drop size are passed through mats made from uniform diameter fibers, and the extent of coalescence is determined from measurements of turbidity and/or drop size distributions made with a Coulter counter before and after the mats. Pressure drop is also measured.

In addition to the purification of aqueous wastes containing emulsified oils, some of the results may be of importance in the filtration of solid wastes and in the improvement of water quality by percolation through soils.

SUPPORTED BY University of California

1.0009, DETERMINATION OF OXYGEN IN SEA WATER

S. LYNN, Univ. of California, School of Engineering, Berkeley, California 94720

Dissolved oxygen can be determined quantitatively by measuring the limiting current drawn by a rotating disk electrode. In sea water certain organic and/or inorganic materials may interfere. The proposed project would aim to a) determine the most suitable electrode material, geometry, and cell configuration; b) determine the range of oxygen concentrations in artificial sea water which can be determined by this method; c) determine which common constituents of sea water interfere with the method and whether this interference can be prevented; and, d) develop the design and circuitry for a device for the continuous monitoring of oxygen in sea water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0010, STUDY OF A SPECIFIC INFLUENCE OF IONIC SPECIES ON STRUCTURING IN WATER

J. GREYSON, North Amer. Rockwell Corp., Canoga Park, California

The proposed work entails an investigation of the free energy and entropy of transfer of ionic salts between heavy and normal water. The salts to be studied will include carbonates, sulfates, phosphates, alkaline earth cations, tetraalkylammonium halides and a large anion such as tetraphenyl boride. The purpose of the investigation is to obtain insight into the influence of dissolved ions on the structure of water. The investigation will be carried out by measuring the heat of solution of the selected electrolytes in heavy and normal water and the electromotive force of electrochemical cells, the configuration of which will represent the process of transfer of the electrolytes between heavy and normal water. Cell configurations will include half cells of heavy and normal water solutions separated by ion exchange membranes. The resulting data will be used to obtain the transfer entropy values which can then be related to the structure influence of the electrolytes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0011, A STUDY OF PRESCALING DEPOSITION

H.L. RECHT, North Amer. Rockwell Corp., Canoga Park, California

A continuation of the laboratory investigation of the phenomenon of scale formation on heat transfer surfaces in saline water conversion will be carried out by exploring the energetics and mechanism involved in prescale deposition preceding actual scale formation utilizing radioactive tracer techniques. Specifically, the following will be carried out:

1) Investigate the energetics and mechanism of the surface influenced processes that precede the appearance of bulk scale on heat transfer surfaces.

2) Measure equilibrium and kinetic parameters of the sorption of calcium sulfate from an aqueous solution onto metals such as copper, copper-nickel alloys, platinum, copper and nickel oxides, and any other materials that appear appropriate.

3) From the measurements values obtained estimate heat of sorption, activation energy for sorption, and entropy of sorption for the various surfaces.

4) Correlate the measured and calculated properties on the basis of bulk scale formation tendencies of the materials.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0012, AQUATIC TRANSPORT OF NUCLEAR DEBRIS

A.R. TAMPLIN, Univ. of California, Lawrence Radiation Laboratory, Livermore, California 94551 (W-7405-ENG-48)

Aside from the physical transport by ocean, ground, and surface water systems, our review of this problem indicated that the major determinants of the ultimate fate of radionuclides within these media are the ion-binding and ion-exchange properties of soils and bottom sediments, and the interactions that occur when fresh water containing soluble radioisotopes merges with salt water. The ion-binding and exchange properties of soil and bot-

1. NATURE OF WATER

tom sediments determine the rate at which fallout material will be leached and moved about by surface water. The fresh-salt water reactions will determine whether or not a soluble radioisotope between fresh water will be precipitated at and, hence, concentrated in the area of interface between fresh and salt water. Both factors considered together determine whether or not a marine 'hot spot' could develop subsequent to the construction of a sea-level canal by nuclear explosives. In this case, it is imperative to develop the ability to predict the rate at which radionuclides are leached from fall-back, throw-out, and base-surge material of the canal site by rainfall and, in addition, the ability to predict whether or not these leached radionuclides will be concentrated as a marine 'hot spot' where this fresh water flows into the ocean.

At the present time, a concerted analytical effort is being applied to this area to bring together and analyze the data contained in existing literature. It is felt that the state-of-the-art as reflected by this literature is adequate to develop a practical predictive capability. If this is not the case, experimental programs will be initiated to obtain the necessary additional information.

SUPPORTED BY U.S. Atomic Energy Commission

1.0013, TRACE ELEMENT STUDY OF SOIL-PLANT-WATER SYSTEMS

G.R. BRADFORD, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

Objectives: 1) Establish the concentration of certain trace elements (Fe, Mo, Mn, Ba, Cu, Zn, Ni, Co, Cr, Si, Pb, Ti, Al, V, B, Sr, Be, Ag, Ge, Ga, Bi, Tl, La, Sn, Cd, As, Au, Sb, and Se) in surface and ground waters of California, 2) Relate trace-element concentrations to the past history of the water, including geologic and use factors, 3) Determine how trace-element concentrations are modified upon the passage of water through soils, 4) Establish the effects of water composition and water-soil interactions on crop plants.

Description of work proposed: Water samples and background data will be supplied through a cooperative arrangement with the California State Department of Water Resources. The above objectives will be accomplished by improved analytical techniques using direct reading emission spectrographic and atomic absorption instrumentation. Samples will be pretreated with chelating compounds and solvent extraction techniques used to separate and concentrate trace elements. Twenty-four large lysimeters installed at the Citrus Research Center will be used to study the water-soil interaction on crop plants and modifications of trace element concentration upon the passage of water through soils.

SUPPORTED BY U.S. Dept. of Agriculture
California State Government

1.0014, PROPERTIES OF SEA WATER AND ITS CONCENTRATES AT TEMPERATURES UP TO 400 DEGREES FAHRENHEIT

L.A. BROMLEY, Univ. of California, Graduate School, San Diego - La Jolla, California 92038

These data are important for desalination processes and for increasing the fundamental understanding of the physico-chemical behavior of sea water. Under OSW Research Grant 14-01-0001-363, heat capacities at constant pressure of one atmosphere have been determined from 2-80 degrees C for sea water solutions ranging from 1.1 - 11.7% salinity. These are approximately 1/3 to 3 1/2 times the natural concentration of sea water. Also, a high pressure calorimeter has been designed and partially built to extend these measurements to 200 degrees C under the present Research Grant. Heats of concentration, vapor pressures, and viscosities will also be studied.

Heats of concentration will be measured as heats of dilution. The atmospheric pressure heat capacity calorimeter has been modified for this new use. For high temperature measurements, the high pressure calorimeter will be altered as required.

The method we are most seriously considering for vapor pressures is the direct measurement of boiling point elevations using an original modification of conventional ebulliometers. These values, cross-checked by those calculated from heats of concentration and heat capacities, should resolve existing dif-

ferences among present values reported by various investigators. Also, enthalpies will be determined from heat capacities and vapor pressures.

Available data on the viscosities of sea water cover only a narrow range of temperature and concentration. It is our present plan to use capillary viscometers at both atmospheric and elevated pressures. Conventional pressure viscometers will have to be modified to satisfy the specific requirements for sea water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0015, DETERMINATION OF THE PHOSPHATE CONTENT OF NATURAL WATERS, AT THE NUTRIENT LEVEL, BY SOLVENT EXTRACTION

G.C. CAVE, McGill University, Graduate School, Montreal - Quebec, Canada

(a) The Proposed Research: To study solvent extraction as a technique for the quantitative concentration of trace amounts of phosphate from natural waters. Phosphate in the resulting concentrate may then be determined by novel or conventional methods.

(a) The objectives, briefly: To develop a rapid quantitative method for phosphate in natural waters, preferably a method capable of automation.

(c) Relation to Health Field: To provide Public Health Engineers with a reliable rapid method for large-scale surveys of lake and river water for phosphate at the nutrient level.

SUPPORTED BY Canadian Government

1.0016, THEORY OF LIQUIDS

D. HENDERSON, Univ. of Waterloo, Graduate School, Waterloo - Ontario, Canada

The successful perturbation theory of liquids developed by Barker and Henderson will be applied to liquids in which the intermolecular potential has a soft-core and, in particular, to the 6:12 potential. This should yield a theory which will give good results for the thermodynamic properties of simple liquids. In addition, better approximations to the second-order term will be sought and this approach will be applied to develop a theory of solutions of molecules of different sizes. The possibility of applying this approach to the calculation of the radial distribution function will be investigated.

Also, improvements to the Percus-Yevick, hyper-netted chain and Born-Green-Yvon theories will be sought by direct calculation of the correction terms to the basic approximations of these theories.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0017, CHANGES IN THE PHYSICAL AND BIOLOGICAL CHARACTERISTICS OF GROUND WATER RESERVOIRS AND ADJACENT SURFACE WATERS

S.M. MORRISON, Colorado State University, Natural Resources Center, Fort Collins, Colorado 80521

The mechanism of removal of bacteria from suspension in waste water flowing through soil materials is under investigation. There are four component studies required: (1) measurement of the electrophoretic mobilities of the bacteria in various electrolyte solutions at different pH; (2) measurement of the electrical potential generated in porous media during flow through the porous material by various electrolyte solutions at various pH; (3) measurement of the removal of bacteria, tagged with a radioactive tracer, from a bacterial suspension passing through a column of porous material; and (4) determination of the distribution in the porous column of the bacteria removed during flow through the column.

A computer program modeling the movement of contaminants in ground water aquifers is being developed. This model will incorporate the effects of natural recharge on the quality of ground water as well as the effects of contamination sources such as brine pits, irrigation and feed lots.

Substantial progress has been made in delineating boundary conditions for ground water flow in the alluvial plains of the Lower Cache la Poudre River Basin. In particular, sub-alluvial

1. NATURE OF WATER

bedrock topography has been established for approximately 900 square miles in Larimer and Weld Counties, Colorado.

Anisotropy of flow in the unconsolidated sediments is being analyzed through geophysical techniques. This analysis should lead to improved understanding of patterns of dispersion of contaminants in subsurface waters.

A series of experiments have been carried out in attempts to clarify the knowledge on survival and movement of microbial particles through soil.

The survival of organisms in soil with known organic additives are to be studied. Also the microbial factor which seems to control survival of enteric in soil is to be studied.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
Colorado State University

1.0018, ION-SOLVENT INTERACTION

R.M. FUOSS, Yale University, Graduate School, New Haven, Connecticut 06520

This research will be directed towards a deeper understanding of the several kinds of short range interionic and ion-solvent interactions that govern observed behavior of aqueous saline solutions. Short range interionic effects are superimposed on the electrostatic forces which cause primary ion associations to pairs. Short range anion-cation effects include dipole (and quadrupole) forces for ions with aspherical charge distribution, polarization forces, and steric factors. Ion solvent effects include charge-dipole electrostatic interaction, hydrogen bonding, polarization (and dielectric saturation), electrostriction, and complex ion formation. From conductance data, the limiting conductance, association constant and contact distance can be calculated by theoretical analysis. Dependence of these parameters on structure and properties of ions and solvent molecules is the information sought. Typical systems to be investigated include the following: (1) lithium, sodium and potassium chlorides in water-dioxane mixtures over a concentration range ten times higher than has previously been covered (made possible by quite recent advances in the theory of conductance); (2) conductance of these salts in mixtures of water with dimethylsulfoxide, acetonitrile and urea; (3), conductance of magnesium, manganese, copper and nickel sulfates in water-dioxane mixtures (and possibly in other mixtures); (4), conductance of potassium and silver nitrates in dioxane-water mixtures; (5), conductance of selected 1-1 and 2-2 salts at 35 degrees and 50 degrees; (6), conductance of alkali and quaternary sulfonates and carboxylates to study non-coulombic association.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0019, THE DETERMINATION OF THE ENGINEERING THERMO-PHYSICAL PROPERTIES OF SOLUTIONS CONTAINING DISSOLVED SOLIDS

D.A. FISHER, Univ. of Connecticut, School of Engineering, Storrs, Connecticut 06268

The raw feed to conversion equipment used in the production of fresh water consists of a solution containing dissolved solids such as brackish water, sea water, the effluent of sewage plants, and other waste waters. Process analysis and the engineering development of conversion equipment is frequently hampered by a lack of knowledge of such properties as specific heat capacity, enthalpy, viscosity, and thermal conductivity of the raw feed and of the concentrated solution as it progresses through the process. It is proposed to experimentally determine these properties to engineering accuracy.

The first phase of the work will be to design and build a calorimeter for the determination of specific heat capacity in the temperature range 40 - 400 degrees Fah. and to prove its accuracy using distilled water.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Connecticut

1.0020, ION - ION AND ION - MOLECULE INTERACTIONS IN AQUEOUS SALT SOLUTIONS

W.L. MASTERKON, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

The objective of the proposed research is to evaluate the relative importance of electrostatic forces, Van der Waals forces and solvent-structure effects in determining the extent of: (1) Association between oppositely charged ions (ion pairing) in aqueous salt solutions. (2) Interactions between solute molecules and ions in water solution.

The electrolytes used in this study will be stable coordination compounds derived from cobalt (III). It is believed that thermodynamic data for solutions of these 'model compounds' can be more readily interpreted than that for so-called 'simple' salts derived from alkaline earth or transition metals (e.g., $\text{Ca}(\text{NO}_3)_2$, CoCl_2), where the exact nature of the cationic species is unknown. The molecular compounds studied will include aromatic hydrocarbons and their halogen derivatives. Here, we shall examine the effect of size and polarity of the non-electrolyte molecule upon its interaction with ions in solution.

The experimental work will involve the measurement of: (1) Activity and osmotic coefficients of coordination compounds in aqueous solution. (2) Conductivities of these compounds in water and mixed solvents. (3) Solubilities of non-electrolytes in water solutions of coordination compounds.

1.0021, SCATTERING MEASUREMENTS ON ALKALI - WATER SYSTEMS

T.I. MORAN, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

The proposed experiment will study the interactions between alkali atoms and water molecules by atomic scattering techniques. These techniques are well established and yield important information on the intermolecular forces involved. Experiments of this type are performed by directing a velocity selected alkali atomic beam through water vapor and measuring the intensity of the scattered alkali beam. At the present time the atomic beam laboratory has an apparatus capable of making such measurements and is studying alkali-halogen interactions (preliminary results have been presented at a recent meeting of the American Physical Society.) The water molecule is of special interest for scattering studies since it has a permanent electric dipole moment (unlike the halogen molecules) which may enable it to be oriented relative to an incident alkali atom. Reactive scattering can also occur with a typical channel being $\text{Na} + \text{H}_2\text{O}$ yields $\text{NaOH} + \text{H}$. The experiments will yield information on the interaction of a single alkali atom with a single H_2O molecule (an unusual feature of this type of experiment).

1.0023, AIR OXIDATION OF ORGANIC COMPOUNDS IN AQUEOUS SYSTEMS

D.W. SUNDSTROM, Univ. of Connecticut, School of Engineering, Storrs, Connecticut 06268

Organic compounds can be oxidized chemically in an aqueous system by heating under pressure in the presence of air. When applied to the disposal of aqueous wastes, the technique is referred to as wet oxidation. Under the usual operating conditions, the organic wastes are not completely destroyed during oxidation. The method is of particular interest since the wastes are removed by chemical rather than by biological action.

The purpose of the project is to determine the reaction kinetics of several organic compounds during wet oxidation. The rate and extent of oxidation of several organic compounds will be examined over a range of temperatures, pressures and concentrations. Since simultaneous mass transfer and chemical reaction occur during wet oxidation, the relative magnitudes of these rate processes will be established. Initial experiments will emphasize the destruction of an insoluble organic compound in a flow reactor. The results of this study should provide a better understanding of the wet oxidation process.

1.0024, AN ANALYSIS OF PHOSPHORUS AND NITROGEN COMPOUNDS IN TIDAL MARSHLAND DRAINAGE - LABORATORY PROCEDURES

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objective: An evaluation of the effects of various types of marshland management on the diurnal and seasonal concentrations of phosphorus and nitrogen in tidal marshes.

Procedures: The water samples collected in the field will be processed in the following manner: 1. Inorganic phosphorus - Reimold, R. J., 1965. An evaluation of inorganic phosphate concentrations of Canary Creek Marsh. This procedure requires that inorganic phosphorus determination be made immediately after sample collection to avoid errors due to sample storage. The determination, a spectrophotometric technique, requires electrical power. 2. Total phosphorus - Water samples for total phosphorus concentrations are processed upon return to the Bayside Laboratory. The sample is oxidized in an ordinary autoclave according to the technique of Menzel, D. and Corwin, N. 1965. This procedure converts all phosphorus to the inorganic form which can then be measured by the technique of Reimold as cited above. 3. Organic phosphorus concentration is determined by the difference between the initially measured inorganic form and the subsequent total phosphorus determination. 4. Nitrate nitrogen - Wood, E.D., F. A. J. Armstrong, and F. A. Richards. 1967. This technique offers extreme accuracy and is easily used in the field. In this new method nitrate is converted to nitrite and then measured as in number 5. 5. Nitrite nitrogen - Strickland, J.D.H., and T. R. Parsons. 1960. A manual of sea water analysis. Fish Res. Bd. Can. 125:71-74. 6. Ammonia nitrogen - Roskam, R., and D. de Langen. 1964. A simple colorimetric method for the determination of ammonia in sea water. Anal. Chim. Acta 30: 56-59. 7. Salinity will be measured by the conductance method using an induction salinometer.

The results will be processed for computer evaluation of the various suspected relationships between the phosphorus and nitrogen concentrations and related physical parameters measured. The I.B.M. computer program STUFF (Sixteen Twenty Universal Function Fitter) will be used to determine significant relationships between organic phosphorus, inorganic phosphorus, total phosphorus, nitrate, nitrite, ammonia, salinity, water temperature, air temperature, tide state, time, lunar phase, day of year and weather. Other statistical and graphical techniques may also be employed to interpret the data.

1.0025, BIOCHEMICAL EFFECTS OF MICROORGANISMS UPON THE SALT MARSH ENVIRONMENT - LABORATORY PROCEDURES

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objective: To enumerate and identify the microorganisms indigenous to various salt marsh environments, and to relate the known metabolic processes of the principal organisms found to the chemical cycles currently under investigation in these marshes.

Procedures: The sediment samples collected in the field will be processed in the following manner. 1. Weighed samples from each sediment horizon will be placed in dilution bottles containing the appropriate diluent, serial dilutions made and the final dilution will be selectively treated to enhance the growth of the organisms believed to be present in the sample. The number of bacteria in each sediment horizon will be ascertained by plating aliquotes from each final dilution into solid growth media. Replicate plates will be made for each sample. After incubation, the colonies growing on the plates will be counted. The number thus attained represents the number of bacteria in the sample when multiplied by the dilution factor. 2. Identification will be made of the more numerous bacteria growing on the enumeration plates. This will be done by standard bacteriological tests. These include biochemical reactions of the bacteria in specially formulated media, and morphological reactions of the bacterial cell to selective stains. 3. Water pH will be measured by means of a pH meter. 4. Water salinity will be measured by the conductance method.

1.0026, BIOCHEMICAL EFFECTS OF MICROORGANISMS UPON THE SALT MARSH ENVIRONMENT - FIELD TECHNIQUES

F.C. DAIBER, State Board of Game & Fish, Dover, Delaware

Objective: To enumerate and identify the microorganisms indigenous to various salt marsh environments, and to relate the known metabolic processes of the principal organisms found to the chemical cycles currently under investigation in these marshes.

Procedures: Sediment samples for bacterial analysis will be collected at locations in Delaware tidal marshes which represent the following conditions: unditched marsh exposed to normal flooding, man-made low level impoundments, high level impoundments, and ditched marsh exposed to normal flooding.

Once every two weeks cores will be taken from each station to a depth which represents the sediment horizons of the station. The sample will immediately be removed from the corer and aseptically transferred to clean polyethylene boxes with tight-fitting lids.

The core samples will be transported immediately to the laboratory so that drying will be prevented or minimized before testing.

In addition, sediment temperatures at the time of sample collection will be measured, and water for salinity and pH determinations at each station will also be collected.

1.0029, THE HEATS OF MIXING OF STRONG ELECTROLYTES

R.H. WOOD, Univ. of Delaware, Graduate School, Newark, Delaware 19711

It is proposed to extend the measurements and the general equations to include mixtures of electrolytes with different charge types. Some measurements of $MgCl_2$ and $BaCl_2$ mixture with $LiCl$, $NaCl$, KCl and $CsCl$ have been started in this laboratory and it is proposed to finish these measurements and include $CaCl_2$ and $SrCl_2$ mixtures as well. In addition, a study of the heats of mixing of Li_2SO_4 , K_2SO_4 , with the alkali metal halides would be useful.

In order to get at the relative influences of water structure and size on the interactions, the preparation of $(HOC_2H_4)_4$, NCl and $(HOC_3H_6)_4$ NCl will be attempted. If successful, the heats of dilution and mixing of these electrolytes would allow the comparison of the properties of large ions with and without hydrophobic surfaces. In addition, the heats of dilution of some strong electrolytes will be measured in D_2O .

1.0031, RADIOISOTOPIC TRACER STUDY TO INVESTIGATE THE MECHANICS OF LITTORAL TRANSPORT AROUND POINT CONCEPTION, CALIFORNIA

D. DUANE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016 (AT(49-11)-2988)

A study to develop techniques to measure sediment movement in the littoral zone is specifically designated for the Point Conception area of the Pacific coast. The basic development program includes a radiation monitoring system capable of deep water monitoring of radioisotopes tagged into sand, analysis of data obtained from measurement of the distribution of the radioisotope tagged sand that has been subjected to the normal effects of waves, tides, and along-shore currents; methods for tagging sand without altering its hydraulic properties and hazard evaluations of the entire transport measuring system. The system is adaptable to sediment transport in both fresh and salt water to depths of 175 fathoms.

The isotope used for sand tagging is ^{133}Xe , thus providing no significant radiation hazard and no alteration of the hydraulic properties of sand indigenous to the test area.

The radiation detection system utilizes scintillation type detectors. Data collection is obtained on punched tape and digital readout from a 400-channel analyzer. Data may be simultaneously coordinated with depth, salinity, and temperature during the monitoring operation.

Cooperative program of federal and state agencies, including:

1.0033, VISCOSITY STUDIES OF AQUEOUS SOLUTIONS

W. DROSTHANSEN, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

Measurements of the viscosity of various aqueous solutions, in particular, with a number of electrolytes to determine B coefficients (in the Dole-Jones equation) and values for dB/dt . These measurements will be carried out over extended temperature ranges and wide concentration ranges. Similar measurements will also be made on electrolytes in mixed solvents (non electrolyte - water solvents).

We intend to measure the viscosity of various non electrolyte solutions in water, particularly aqueous alcohol solutions including tertiary butanol.

It is intended to measure the viscosity of heavy water as a function of temperature to obtain similar information regarding the energy of activation for viscous flow of deuterium oxide as was obtained for pure water in our earlier study.

1.0035, STRUCTURE IN SOLVENTS AND CONCENTRATED SOLUTIONS

G.R. CHOPPIN, Florida State University, Graduate School, Tallahassee, Florida 32306

The near infrared spectrum of water and saline solutions is to be studied as a function of temperature and solute concentration. The D_2O solvent systems are to be studied similarly. The spectral

1. NATURE OF WATER

curves would be analyzed to obtain the mole fractions of solvent molecules in different states of hydrogen bonding. Solutions of H₂O and D₂O with organic solutes would be studied in the same manner. The primary interest is to ascertain the effect of ionic and organic solutes on solvent structuring via hydrogen bonding. The first question to be considered is the validity of the Buijs and Choppin interpretation of the near infrared spectra of water and aqueous solutions. Careful study of spectral curve shapes and baselines are an integral part of such an evaluation.

The near infrared spectra of hydrated organic ion exchange resins would be studied by the reflectance technique. The analysis would follow that for the aqueous solutions. If successful, comparison of these results with NMR data of hydrated ion exchangers could provide a much more detailed model of the solution state in an ion exchange resin.

1.0037, A LABORATORY STUDY OF THE SOLUBLE METALS IN ROCKS, SAPROLITE, AND SOIL FROM THE BROAD QUADRANGLE, GEORGIA

C.A. SALOTTI, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The primary purpose of this study is to determine in the laboratory the solubilities of extractable trace metals of rocks, saprolite, and soils from the Broad Quadrangle, Georgia in relation to the following variables: temperature; pH; redox potential; organic solutions; and time.

The experiments will be at low temperatures and pressures. The system will be entirely made from fluorocarbon resin.

Analysis will be mostly done in a custom atomic absorption spectrophotometer that is considerably more sensitive than any available commercial unit. Elements present in readily detectable amounts will be determined using a Perkin-Elmer 303 Atomic Absorption Spectrophotometer. Elements already detected in ground water from the Broad Quadrangle without concentration include the following: Mg, Ca, Mn, Fe, Al, Si, Zn, Cu, Pb, and Li. In addition Mo, Ba, Sr, Hg, V, Cr, Ni, Co, Sb, Sc, and As will also be looked for.

1.0038, OXYGEN TRANSFER TO WATER DROPLETS

P.G. MAYER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The reaeration of oxygen-deficient streams and lakes is of utmost importance to the full utilization of water resources.

A possible method for obtaining water with relatively high concentrations of dissolved oxygen is that of spraying oxygen-deficient water into a pressurized tank with pure oxygen or with air. The water would fall through the atmosphere, absorbing oxygen as it did so, and collect in a receiving pool from which water could be withdrawn to enrich oxygen-deficient waters.

A preliminary theoretical and experimental investigation was conducted with an oxygen atmosphere. A literature survey was

made of the basic interphase mass transfer theories. The preliminary experimental study employed a 75 gallon tank into which water was sprayed through whirl-type nozzles. The operating pressures ranged from zero to approximately 10 atmospheres. Oxygen concentrations were measured with galvanic oxygen analysers. For the pressures applied, a fifteen-fold increase in dissolved oxygen concentration could be obtained.

The present work is carried out with compressed air in an improved reactor. It is proposed to study the cost-efficiency of the method in its application to oxygen-deficient streams and lakes.

SUPPORTED BY Georgia Institute of Technology

1.0039, THE STRUCTURE AND PROPERTIES OF WATER SOLUTIONS

R.A. PIEROTTI, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The research proposed is an effort to separate the interaction of the solute with water into two parts: the solute-water interaction and the solute-solute interaction in the presence of water. Accordingly, the proposed research is made up of two parts: (a) An experimental study of the solubility of simple molecules in both H₂O and D₂O as a function of temperature and (b) a theoretical study of the nature of solute-solute interactions in a condensed medium.

The experimental study will be aimed at determining the thermodynamic properties of dilute aqueous solutions and associating these properties with the structure of liquid water and heavy water. The initial studies will be concerned with the solubilities of small organic molecules, i.e., benzene, toluene, carbon tetrachloride, etc.

Comparisons of the solubility of simple non-polar molecules in H₂O and D₂O can be very important in understanding the effects of the water structure around solute molecules. The measurements made in this part of the research will be in the Henry's Law region and as such are concerned primarily with the nature and magnitude of the solute-solvent interaction energy.

The theoretical study is an attempt to use solubility data in the region of deviations from Henry's Law to ascertain the form of the potential energy function for the solute-solute interaction as perturbed by the solvent. The formalism of statistical thermodynamics will be used to develop a theoretical technique for evaluating the potential functions for solute-solute interactions from gas solubility measurements.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Georgia Institute of Technology

1.0040, APPLICATION OF MODERN ELECTROANALYTICAL TECHNIQUES TO THE ANALYSIS OF HEAVY METALS IN WATER

P.E. STURROCK, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The proposed research plan involves laboratory and field investigations directed at determining the suitability of modern electroanalytical techniques for the analysis of water for trace contaminations by heavy metals. The approach will be to determine the sensitivity limits, accuracy and interferences for a number of metal ions using solutions of known concentrations prepared in the laboratory. Then the procedures and techniques developed will be tested on samples obtained from various points along the Chattahoochee River to see if point to point and day to day fluctuations of heavy metal concentrations can be observed.

Laboratory investigations will employ the following methods: 1. Square-wave polarography. 2. Phase-selective A.C. polarography. 3. Derivative chronopotentiometry.

1.0041, METHOD FOR QUANTITATIVE ANALYSIS OF PHENOLS IN FUEL CELL PRODUCT WATER

H.J. ONEILL, IIT Research Institute, Chicago, Illinois

Techniques for determining phenolic material at the 100-ppb level and hydroquinones and quinones at the 1-ppm level in fuel

1. NATURE OF WATER

cell product water were developed. The analyses can be performed on 1 ml of water and require approximately 1 hr.

The phenol procedure involves a preliminary steam distillation in a silanized distillation apparatus and spectrophotometric determination with 4-aminoantipyrine as the reagent. In order to achieve adequate resolution and sensitivity, a reagent-blank compensation procedure is described. Techniques for increasing the sensitivity fivefold are recommended.

Hydroquinone and quinone determinations are performed with phloroglucinol as the reagent and by direct ultraviolet scanning. The former method is the method of choice for hydroquinone and quinone because it can be performed directly on the product water and because other extraneous organic matter in the product water does not appear to interfere, at least at the 1-ppm level. Sensitivity to *t*-butyl hydroquinone by this method is poor. The ultraviolet procedure exhibits greater specificity for individual components, but it requires removal of the aromatic sulfonic acids prior to analysis.

1.0043, THERMODYNAMICS OF WATER AND WATER SOLUTIONS

M.J. JONCICH, Northern Illinois University, Graduate School, *DeKalb, Illinois* 60115

Heats of solution will be carried out over the temperature range of 0-50 degrees C on salts containing the ions; Na, K, Ca, Mg, Cl-, CO₃, SO₄ and others as well as the gases; O₂, N₂, and CO₂. The integral heat method will be used to determine partial molal heat capacities of the above salts and gases. Extrapolation to finite dilution of the data will permit evaluation of partial molal heat capacities and entropies at infinite dilution.

Use will be made of these data to check the 'Correspondence Principle' of Cobble and to permit calculation of partial molal ionic thermodynamic properties. The changes in the thermodynamic properties of the solutes will be related to the change of structure of water. These results will be correlated with the theories of Nemethy-Scheraga, Frank-Quist, Eyring, and Samoilov concerning the structure of water and the effects of dissolved electrolytes and gases.

The same experimental data will be used to determine coordination numbers of the ions and gases using the theoretical approach proposed by Samoilov.

1.0049, TRANSPORT PROPERTIES OF AQUEOUS ELECTROLYTE SOLUTIONS - AN APPROACH FROM THE HIGH CONCENTRATION LIMIT

C.A. ANGELL, Purdue University, Graduate School, *Lafayette - West Lafayette, Indiana* 47907

The transport behavior of highly concentrated and super-saturated electrolyte solutions, which is clearly intractable using the Debye-Huckel approach, has proven very amenable to analysis by means of simple equations originally proposed to describe the temperature dependence of transport processes in glass-forming organic liquids (which include most liquid polymers and polymer solutions). Transposed forms of these equations which give a convincing first order approximation account of the con-

1. NATURE OF WATER

centration dependence of electrolyte solution conductance and viscosity, have recently been proposed and discussed by the principal investigator. These equations have as their theoretical basis the assertion that, providing the first order transition to the crystalline state is averted, the liquid state properties of an assemblage of attractively interacting particles must vanish at a temperature $T_{\text{sub zero}}$ (where $T_{\text{sub zero}}$ is greater than 0 degrees K) due to the vanishing of the configurational entropy content. The phenomenon of the liquid-glass transition is directly related to this circumstance. $T_{\text{sub zero}}$ is a function of equivalent concentration and for salts of multivalent cations reaches room temperature for solutions less concentrated than the pure (metastable) liquid salt. The condition ($T_{\text{sub zero}}$ equals isothermal temperature) may thus set the high concentration limit ($N_{\text{sub zero}}$) for electrolyte transport in such a system.

The present work is concerned with a determination of the useful limits of this approach and the clarification of the physical nature of the transport equation parameters.

1.0052, DISSOLVED GASES AND WATER CLUSTERING IN AQUEOUS SOLUTION

G. GORDON, Univ. of Iowa, Graduate School, Iowa City, Iowa 52240

The purpose of this research is to study the kinetic and equilibrium properties of dissolved gases and related materials in aqueous solutions. By means of this type of approach, which utilizes a variety of methods, it appears to be possible to rationalize some of the complexities of the solvent. Thus we should be able to obtain more definite conclusions about the primary steps in chemical reactions and positive information with respect to the species in solution and their interactions with water itself.

Presently, we are studying the $\text{C102-H}_2\text{O}$ system by means of techniques such as classical thermodynamic properties, electron paramagnetic and nuclear magnetic resonance spectroscopy, optical spectroscopy, temperature jump, and other kinetic measurements. By means of the above techniques, we hope to elucidate the modus operandi of these observations. Initially, we are studying chlorine dioxide in water as a model system. We intend to extend our measurements to include other ionic and molecular species such as CO_2 , SO_2 , SO_3 , $(\text{t-BU})_4\text{NBr}$ and the like.

1.0053, FIXATION AND AVAILABILITY OF ADDED PHOSPHORUS IN SOILS

J. HAGIN, Technion Res. & Develop. Fdn., Haifa, Israel

Object: To evaluate the phosphorus availability and fixation of various fertilizers, in different soils, as related to their nutritive value.

Plan of Work: Diffusion of phosphorus from the vicinity of a fertilizer particle is determined by (1) the apparent diffusion coefficient--this is a function of the reactions of phosphorus with soil components and properties; and (2) the potential gradient between the solution near the particle surface and the bulk soil solution--this is a function of change in phosphorus concentration in the soil solution and of the path length. In the first phase the solubility of various phosphatic fertilizers in defined solutions as well as in soil systems will be measured. The relation of the phosphorus concentration on the fertilizer particle surface to the amount and rate of solubilization will be studied. In the second phase the influence of soil properties on phosphate diffusion will be evaluated and measured by changes in the concentration of phosphorus in the soil zone surrounding the fertilizer particle, taking into account the concentration gradient between the particle surface and the bulk soil. Fixation rate, in soils, of phosphorus from various fertilizers will be measured. Factors affecting the solubility and availability of phosphates will be measured, for example, solubilization of difficultly soluble coats formed on originally soluble phosphates.

SUPPORTED BY U.S. Dept. of Agriculture

1.0054, MODE OF OCCURRENCE OF MINOR ELEMENTS IN SEDIMENTS AND SOILS

D.H. YAALON, Hebrew University, Jerusalem, Israel

Object: To determine the mode of occurrence and geochemical transformations of micronutrients during weathering by measuring their presence in ground water and their distribution among different particle size fractions of various soils and rocks. Elements under study will include copper, zinc, cobalt, nickel, boron, chlorine, iodine, sulfur and possibly others.

Plan of work: Trace elements content in several separate fractions of the materials examined will be determined. This will include the water soluble and acid soluble fractions, and elements associated with the organic matter extract. Soils and silicate materials will be separated into clay, silt and sand size fractions, and additional mineralogical separation accomplished by heavy liquid separation. The noncarbonate residue of limestones and calcareous soils will be similarly treated. Ground water composition will be related to the soil and rock analyses. It is proposed to examine, in the course of three years, the major soil groups and sedimentary rocks occurring in the Eastern Mediterranean. Results may be subjected to a proper statistical analysis and correlated with other known properties of the materials. Samples from other regions may be added subsequently.

1.0055, TRACE ELEMENT CHEMISTRY OF STREAMS OF THE LOWER KANSAS RIVER BASIN

E.E. ANGINO, Univ. of Kansas, State Geological Survey, Lawrence, Kansas 66045

Study of the annual variation of trace element content (Co, Ni, Li, Si, Zn, Fe, Mn, Sr) of the Saline, Smoky Hill, Solomon, Delaware, Wakarusa and Kansas Rivers was undertaken for two reasons. (1) To develop methods for trace element analyses of water samples by atomic absorption spectrometry and (2) To accumulate information on the 'back-ground' trace element load of these streams for which little elemental data is presently available. This latter consideration was considered in light of studies relating to water pollution studies of the Kansas River. The work consists of collection, preparation, analysis of the samples and interpretation of results.

1. NATURE OF WATER

SUPPORTED BY Kansas State Government

1.0056, UTILIZATION OF OIL FIELD BRINES AS A POSSIBLE FERTILIZER SOURCE

E.E. ANGINO, Univ. of Kansas, State Geological Survey, Lawrence, Kansas 66045

Large amounts of oil-field brines are produced annually in Kansas. Experimental work is being conducted to determine the feasibility of recovering a useable fertilizer material from these brines, subsequent to appropriate chemical treatment. Results, to date, are encouraging, but additional evaluation work is required. The work includes (1) determining the nature of the separated product by x-ray diffraction analysis, (2) determining the chemical composition of the complex precipitated product by atomic absorption and emission spectrography, and (3) evaluating the product from different brines to ascertain the constancy of the product produced.

SUPPORTED BY Kansas State Government

1.0057, THERMAL PROPERTIES OF SALT SOLUTIONS

R.J. BEARMAN, Univ. of Kansas, Graduate School, Lawrence, Kansas 66045

The objective of the proposed work is to investigate the thermal conductivity of aqueous salt systems. We plan to construct apparatus for the determination of thermal conductivity, to measure the thermal conductivity and to develop theoretical equations for the interpretation of the results.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0058, INTERACTION OF ORGANIC MOLECULES IN WATER

T. HIGUCHI, Univ. of Kansas, Graduate School, Lawrence, Kansas 66045

The proposed study is concerned with elucidation of enzymatic catalytic mechanism and, indirectly, action of drugs. The program is based on series of investigations of model systems. Approximately one half of the total effort will be directed towards elucidation of mechanisms of molecular binding or association in aqueous media, the remainder to chemistry of facilitation of reactions in aqueous solution by organic species and functional groupings. Primary attention has been directed towards hydrolytic reactions of acyl derivatives such as esters, amides, acid anhydrides, acyl halides, etc., and catalyzed oxidation of thioethers.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

1.0059, ION HYDRATION AND ION INTERACTION

G. ATKINSON, Univ. of Maryland, Graduate School, College Park, Maryland

Measurements will be made of ultrasonic absorption in aqueous solutions of Mg(II) and Ca(II) salts in an effort to examine the effect of 'inert electrolytes' such as NaCl on ion association processes. Measurements of ultrasonic absorption in aqueous solutions of tetraalkylammonium salts will be expanded and extended to non-ionic clathrate forming compounds. A cooperative program on the measurement of ultrasonic absorption and velocity in aqueous solutions of simple salts over wide ranges of frequency, temperature and pressure will be further implemented. This program involves this research group and the acoustics research groups at Catholic University and American University.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0060, CLOSED SYSTEMS FOR ANIMAL SEWAGE TREATMENT

J.T. CLAYTON, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003

The specific objectives of the proposed research are: (1) To develop a waste stabilization system that will minimize the polluting strength of manure and other dairy farm wastes; and (2) to clarify, by digestion and subsequent treatment, the liquid (or liquifiable) parts of dairy farm wastes so that the system effluent

can be safely disposed of or used as the agent for subsequent cleanings of the dairy facility.

Two experimental sewage processing systems will be used. The first will consist of primary settlement of the influent with secondary aerobic digestion. In the second system aerobic digestion will precede settlement. Effluent quality and the fate of indicator organisms, will be the principal criteria of performance.

Microbiological determinations will be made in order to obtain the following information: (a) the activities in the various states of the process; (b) the public health hazards associated with the final sludge and effluent; and (c) to determine the degree of disinfection necessary before discharge.

Later experiments will include the use of coagulants, coagulant aids, and chemical treatments. Dosage and effectiveness of ion exchange minerals and resins will be investigated with special emphasis on odor and color effects. Chemical treatments for microorganism control and small organic particle removal will be studied.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Massachusetts

1.0061, SPECTROSCOPIC AND DIELECTRIC STUDIES OF NEW HYDROGEN BONDED SPECIES

R.R. HOLMES, Univ. of Massachusetts, Graduate School, Amherst, Massachusetts 01003

It is proposed to carry out an appropriate experimental program which will lead to a more precise understanding of the energetics involved in hydrogen bonding phenomena and establish experimental conditions favoring the formation of new hydrogen-bonded complexes involving water. In this regard spectroscopic studies (including far-infrared measurements), dielectric studies, and vapor density measurements will be performed.

In order to aid the development of the theory, it is necessary to provide detailed experimental information describing hydrogen bonding phenomena in water and related substances. Most studies of hydrogen bonding deal with the condensed phase, liquid or solid, and suffer the disadvantage, that because of complications arising from intermolecular interactions, an aggregate of hydrogen-bonded systems are present. What one is then measuring is an average property associated with the aggregate.

Little attention has been given to gas phase systems, even though these systems provide a more ideal environment. In such a system an opportunity is provided to isolate a particular hydrogen bond, free from intermolecular effects. An investigation of a hydrogen bonding system in the gas phase and comparison with the results of the condensed phase study of the same system should provide greater insight, first of all, into the nature of a hydrogen bond and, secondly, the changes that occur in going from the gas to the condensed state.

1.0062, THE ROLE OF WATER IN ORGANIC REACTIONS

C.G. SWAIN, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

Research designed to determine the mechanism of common polar reactions in solution in considerable detail, the exact structures of their transition states, how these change with the structure of the reactants, and the nature of any intermediates, to discover new tools and principles to aid in the study of mechanisms and to develop new quantitative relations between structure and reactivity. Reactions under study include halide and ester solvolyses, ketone enolization, carbonyl addition reactions, and displacements on carbonyl carbons. Also, being investigated are mechanisms of acid, base and polyfunctional catalysis, the structure of water and water solutions, and solvent isotope effects in light and heavy water.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

1.0063, EFFECTS OF POLAR ORGANIC SOLVENTS ON ENZYME ACTION

Y. KU, Monsanto Research Corporation, Everett, Massachusetts 02149

1. NATURE OF WATER

Objective: a. Problem: The objective of this research is an extensive investigation of enzyme reactions in high concentrations of polar organic solvents to determine the role of water in enzyme catalysis. b. Application: Virtually all speculation on extraterrestrial life begins with the assumption that water is necessary for life, based on the argument that enzymes are necessary for life, and enzymes require water.

Approach: The kinetic parameters of enzyme-water interaction; the real significance of 'bound water' associated with dissolved enzyme; the nature of pH versus activity for enzyme reactions; thermal stabilities of enzymes in the dry state versus aqueous; and enzymatic reactions below 0 degree C will be determined.

1.0064, AN INVESTIGATION OF ION MOBILITY IN AQUEOUS SOLUTIONS

S.B. BRUMMER, Tyco Laboratories Incorporated, Waltham, Massachusetts

It is proposed to investigate the basic mechanism of translational processes in liquids. The limiting ionic conductance in aqueous solutions will be used as a model for the study. Measurements will be made over a wide range of temperature (0-80 degrees C), pressure (1-3000 atmos) and concentration (10 to the minus 4 power - 10 molar), for a range of simple salts. Such studies of the P-V-T characteristics of the systems as are required will be made, but the emphasis will be on making a careful and thorough investigation of the temperature and pressure coefficients of the limiting ionic conductance. In analyzing the data, particular attention will be paid to separating the effects of temperature and density. These two fundamental parameters have almost invariably been confused in the past and it is thought that a considerable clarification of the mechanism of transport processes in aqueous solutions will be obtained if their effects are carefully distinguished.

1.0065, THE USE OF AMALGAM ELECTRODES TO MEASURE ACTIVITY COEFFICIENTS OF METAL SALTS IN MULTICOMPONENT SALT SOLUTIONS

J.N. BUTLER, Tyco Laboratories Incorporated, Waltham, Massachusetts

Electrodes consisting of a dilute amalgam of a metal such as Na, K, or Ca, with mercury, can be used to measure directly the activity coefficients of salts of the metal in multicomponent salt solutions. Such measurements greatly extend our present knowledge of the thermodynamics of multicomponent salt solutions.

The important factors in obtaining accurate activity coefficient measurements with amalgam electrodes are (1) purity of reagents, (2) rigorous exclusion of oxygen from the system, and (3) corrections for dissolution of the amalgam. An experimental system for carrying out these measurements is being constructed.

The proposed research program includes measurements on the systems KCl-NaCl and LiCl-NaCl, which can be compared with results of the isopiestic method; and the systems MgCl₂-NaCl and CaCl₂-NaCl, which are of importance in connection with the chemistry of sea water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0066, NITRIFICATION BY MARINE MICROORGANISMS

S.W. WATSON, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

This proposal is for the continuation and expansion of our studies on the role nitrifying bacteria play in the ocean and the molecular mechanisms by which these organisms convert, store and utilize energy derived from the oxidation of ammonia or nitrite. The specific objectives include: (1) the isolation and purification of new marine nitrifying bacteria; (2) the determination of the vertical and horizontal activity and distribution of nitrifying bacteria in the open ocean; (3) a morphological study of the fine structures of nitrifying bacteria; (4) a study of the metabolic

pathway by which marine nitrifying bacteria oxidize ammonia to nitrite and nitrite to nitrate using cell free systems; (5) an attempt to elucidate the reason or reasons why nitrifying bacteria are obligate autotrophs (6) a study of the role of the submicroscopic cytomembrane systems and other submicroscopic structures observed in *Nitrosocystis oceanus*, *Nitrosomonas europaea* and *Nitrobacter agilis*; (7) a study of the kinetics of nitrification; (8) the development of new cultural techniques.

1.0067, ASYMMETRIC BUBBLE COLLAPSE STUDIES 6310

F.G. HAMMITT, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan (DAHC04-67-C-0007)

Objective: To investigate the manner of asymmetric collapse of cavitation bubbles in various hydrodynamic situations.

Approach: Both theoretical and experimental methods will be used. It is planned to: (1) Obtain photographic evidence of the actual nature of bubble collapse in a flowing system under substantial pressure gradients, (2) Develop theoretical analyses of collapsing cavities to correlate with the experimental observations in order to better understand the influence of various boundary conditions on the mode of collapse, (3) interpret the theoretical results in terms of the potential of cavities in a liquid to damage solids, drawing on knowledge already obtained and to be obtained in the proposed work from the experimental observations.

Progress: The asymmetric mode of collapse of cavitation bubbles has been studied both experimentally and theoretically. In the experimental investigation, a spark camera capable of taking 12 frames in a period of the order of 20 sec. has been built and tested. The detailed analysis of pictures produced by this camera is under way. A study of the theoretical problem has led to a decision to use a MAC (Marker and Cell) type of computer code as the basis for a numerical solution of the governing differential equations. The code has been written and checked out by application to the symmetrical bubble collapse problem (Rayleigh's problem) to which an analytical solution is known. Work is in hand on the application of the code to the asymmetric problem.

1.0068, EFFECTS OF LIMNOLOGICAL FACTORS ON UPTAKE OF CS137 BY FISH

N.R. KEVERN, Michigan State University, Institute of Water Research, East Lansing, Michigan 48824 (AT(11-1)1795)

Certain limnological factors, theoretically suspected for influencing the accumulation of 137Cs by fish, are being investigated in a series of lake types. Multiple regression analysis will be used to determine which of the factors are the most important. The factors measured in each of the six lakes will be cesium-137, stable cesium, sodium, potassium, and specific conductivity along with standard limnological measurements of pH, alkalinity, temperature, dissolved oxygen, and secchi disc readings. Measurements of the concentrations of 137Cs and stable Cs in samples of largemouth black bass from each lake and in the lake waters will allow demonstration of the importance of the specific activity of the water on the accumulation of 137Cs by fish. A second phase of the project will be directed at testing if trophic position is a factor in the accumulation of 137Cs. Other studies, at least in terrestrial ecosystems, have indicated an increase of 137Cs concentrations of about three-fold between trophic levels. Samples of the aquatic plants and organisms, including fish, from a single lake and representing the trophic levels of producer, herbivore, omnivore, and carnivore will be analyzed for 137Cs content and compared. The overall objective of the study is to gain the knowledge necessary to permit us to predict maximum concentrations of 137Cs in iced fishes from estimated inputs of the radionuclide to natural waters.

1.0069, GEOCHEMICAL INVESTIGATION OF THE GROUNDWATER SYSTEM IN THE LANSING, MICHIGAN, AREA

S.B. ROMBERGER, Michigan State University, Graduate School, East Lansing, Michigan 48824

This program involves the collection of baseline geochemical data on subsurface water in contact with the Saginaw formation, the most important groundwater aquifer in the Lansing area. These data will be used to evaluate new sources of potable groundwater to supplement the presently dwindling supply of uncontaminated surface water. Subsurface chemical data will be correlated with water quality data already available for surface waters, and the chemical composition of the enclosing rocks to determine their role in controlling the chemistry of groundwater. The major constituents to be determined are hydronium ion (pH), sodium, calcium, potassium, magnesium, iron, bicarbonate, sulfate, chloride, nitrate, and phosphate. The state of equilibrium of the groundwater with its environment will be calculated using thermodynamic data. Reactions of contaminated surface water with groundwater and earth materials will be investigated both in the field and in the laboratory to determine beneficial and deleterious products. Using the data collected and the environmental factors determined, a geochemical model will be calculated.

1.0070, TRAVEL OF NITROGEN IN SOILS

G.J. SCHROEPFER, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

Work on the project began in October of 1962. Initial work included soil lysimeter studies as well as bench experiments in which soils and contamination waters were intimately mixed. These studies were directed at determining the chemical and physical factors affecting the travel of nitrogen compounds. In 1963 a sampling program was initiated to obtain field data to correlate with laboratory results. Ground water observation wells were installed in the vicinity of waste stabilization ponds and septic tank tile fields. This field sampling program is continuing at present on an expanded scale. In 1965 a controlled feed soil absorption system was installed employing synthetic substrate, along with a system of 12 observation wells, to determine the rate of nitrate formation and its movement in ground water.

An additional controlled feed soil absorption system has been installed in a soil with an effective size several times smaller than that of the original system. Additional pond studies are also being carried on. These systems, along with a study of the microorganisms involved, are providing data to determine the factors governing the movement of nitrogen compounds through soils and to evaluate the travel limits of nitrogen, in its various forms, under field conditions in the vicinity of underground pollution.

1.0071, FREE SURFACE VORTEX RESEARCH

G.H. KEULEGAN, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi

Technical Objective: Provide basic laboratory information concerning the effects of fluid viscosity on (1) the incipient conditions for vortex formation, (2) its shape and size, and (3) its rate of decay. Compare experimental results with theory and other laboratory information in an effort to improve the understanding of the vortex phenomenon.

Approach: The following variables will be considered in a systematic laboratory investigation of the free surface vortex in a cylindrical tank. Radius of tank, diameter of orifice, depth of fluid in tank, radial velocity, tangential velocity, kinematic viscosity of fluid, density of fluid, surface tension of fluid, acceleration of gravity, depression of surface at a particular distance from the center of the tank, and circulation. The effects of viscous forces on the vortex phenomenon will be studied by varying the

Reynold's number while other parameters are held at specified values. This will be accomplished through the use of several different liquids (water, glycerine, different grades of oil) in the system. Observations will be made of incipient conditions for vortex formation with each test fluid. Surface profile measurements will be recorded for the stable vortices produced by given test conditions. Velocity measurements will also be made during stable flow conditions. Observations will be made of the time required for the vortex to decay due to viscous forces when the circulation system is closed.

Progress (Jan 66 - Jun 67): Measurements of water depth, discharge and vane angle and the vortex profile were made for a 4-in.-diameter by 24-in.-long outlet tube with free discharge and with a 1-in. orifice at the bottom. Future investigations will use a simple exit orifice at the level of the bottom of the vortex tank. A second piece of apparatus is being built to check viscosity.

SUPPORTED BY U.S. Dept. of Defense - Army

1.0072, ANALYSIS OF MIXING PHENOMENA ASSOCIATED WITH THE RISE OF GASEOUS BUBBLES THROUGH A STRATIFIED LIQUID

R.A. SAGER, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi

Technical Objective - To study the mixing of an underlying saltwater layer with an overlying freshwater layer, produced by a pneumatic barrier system (bubble screens). The results of this study will be used to determine the optimum design of a pneumatic barrier to achieve maximum vertical mixing at minimum cost of construction and operation, and also to determine possible scale effects attributable to air bubble size and other factors. This work unit is primarily a pilot study for future research to be aimed at increasing the degree of vertical mixing and thereby provide beneficial alterations to the hydraulic, salinity, and shoaling regimens of estuaries.

Approach - Investigations will be conducted in a large basin having the approximate dimensions of 20 ft. wide by 50 ft. long by 8 ft. deep. Tests will be conducted to study such variables as initial density difference between the saltwater and freshwater layers, depth of the pneumatic barrier below the water surface, rate of air supply to the pneumatic barrier, the size and spacing of air outlets in the barrier, and the effects of multiple distribution lines as opposed to a single line.

Progress (Oct 66-June 68): A literature and state-of-the-art review was completed. A general test program was prepared and construction of all test equipment was completed. Evaluation tests of air flow distribution from the diffuser pipe indicated adverse results. Tests to define the effects of size and spacing of air outlets on the mixing rate were completed using 1/8 in. holes on 6 in. centers and 1/16 in. holes on 2 in. centers. Preliminary results of these tests indicate essentially no significant difference in the mixing rate of an initially layered fresh and salt water system into a saline mixture for the two different sizes and spacings of air outlets. Tests to define the effect of flow rate were initiated with two tests completed. Analysis of test data was initiated.

1.0073, NMR AND X-RAY STUDIES OF STRUCTURE IN AQUEOUS ELECTROLYTE SOLUTIONS

D.W. LARSEN, Univ. of Missouri, Water Resources Research Ctr., Columbia, Missouri 65202

A study is proposed to elucidate the nature of the interactions which occur between oppositely charged ions and between ions and water molecules in aqueous solution. The techniques to be used in the study are NMR spectroscopy and X-Ray diffraction.

The NMR Studies will provide information about configurations in solutions containing large, structural anions and cations. The large-angle X-Ray Studies will provide information about configurations in solutions containing small, structureless ions, and the small-angle X-Ray Studies will be used to study isothermal compressibility and long range structure.

It is expected that the combination of NMR and X-Ray Studies will enable the behavior of a wide variety of ions to be investigated as a function of temperature, from which valuable in-

1. NATURE OF WATER

formation concerning the electrostatic potentials surrounding ions will be obtained.

University of Missouri

1.0074, A STUDY OF THE INTERACTIONS PRESENT IN AQUEOUS SALT SOLUTIONS BY NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY

D.W. LARSEN, Univ. of Missouri, Water Resources Research Ctr., Saint Louis, Missouri 63121

A study is proposed to elucidate the nature of the interactions which occur between oppositely charged ions and between ions and water molecules in aqueous solution. The systems to be studied will be composed of tetraalkylammonium ions and paramagnetic complex transition metal anions in deuterium oxide solution. Data obtained from the studies is expected to provide information about the configurations and internal motions of the various species present in solution.

The research will focus upon the correlation of configurations and internal motions with variable parameters of the anion, such as size, charge, nature of the ligand, and nature of the metal-ligand bond. It is expected that studies made on a large variety of paramagnetic complexes will aid in the increase of knowledge of the electrostatic potential surrounding the anion.

Significant advances in many of the aspects of conservation and development of the nation's water resources are necessarily preceded by advances in understanding of the nature of pertinent basic processes. This research project hopefully will add to the basic understanding of the interactions between some species that pollute water.

1.0075, WATER-SOIL-PLANT RELATIONS

R.H. RUF, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

Objectives: To evaluate the interaction of root medium stress and transpirational stress as imposed by temperature, light and relative humidity on plant growth and cell maturation. To determine the effect of this stress on differential cell maturation and subsequent growth resumption when the stress is relieved.

Procedures: Plants will be grown in nutrient solutions containing polyethylene glycol (Carbowax 1540) as an osmotic agent. Aerial stress will be regulated in controlled environment chambers by light intensity, relative humidity and temperature. Cell maturation and internal cell osmotic concentration will be measured with a Warburg respirometer and vapor pressure osmometer respectively. The growth rate after a stress period will be measured either with whole tubers or tissue discs grown on nutrient agar.

1.0077, METAL ION INTERACTIONS WITH WATER

T.G. SPIRO, Princeton University, Graduate School, Princeton, New Jersey 08540

Statement of Objective: The interest which motivates the research proposed here revolves around the mutual interaction of metal ions in aqueous solution, especially under conditions that are biochemically relevant. This interaction arises from the

ubiquitous formation of hydroxyl bridged polynuclear complexes in metal ion solutions. Of particular biological interest is the fact that many naturally occurring chelating agents leave one or more metal ion coordination sites occupied by water, hence susceptible to hydrolysis and polymerization. Since the physiological pH range is precisely where hydrolysis is expected for many metal ions, the occurrence of polynuclear structures in biological fluids is entirely probable. That they may be of biochemical importance as well is indicated by our finding that the marked catalysis of ATP dephosphorylation by copper (II) ions involves a dinuclear copper chelate. Of similar relevance is the finding that a citrate stabilized high polymer of iron (III) can be used to reconstitute ferritin from apoferritin.

Our research efforts are aimed at structural elucidation of polynuclear complexes using Raman spectroscopy and other physical techniques; at exploring the kinetic implications of polynuclear species in metal catalyzed ATP reactions; and at studying the formation of chelate stabilized high polymers of metal ions.

1.0078, DIELECTRIC PROPERTIES OF HYDROGEN-BONDED LIQUIDS

W. DANNHAUSER, State University of New York, Graduate School, Buffalo, New York 14214

The purpose of this research is to extend measurements of the dielectric constant of some simple hydrogen-bonded liquids as a function of frequency, temperature, and pressure. Equilibrium data will be analyzed in terms of intermolecular associative equilibria involving hydrogen-bonds as a specific function of molecular geometry. The ultimate results will be expressed as the thermodynamic parameters characteristic of the associative equilibria. Dielectric dispersion data will be analyzed in the context of Eyring's theory and also in terms of fluctuation-correlation theory.

One part of the program entails the measurement of the dielectric constant of a number of isomeric octyl alcohols over a wide range of temperature and frequency. By varying the position of the -OH group in the molecule, and thus the extent of steric interference with intermolecular hydrogen-bonding, it is possible to obtain liquids whose extent of association varies widely. Because the isomers all have essentially identical molar volumes and dipole moments, differences in their dielectric behavior must be due entirely to specific differences in the shape of the molecule. The possibility of correlating equilibrium properties with dielectric relaxation will be studied.

The major goal of the project is to extended dielectric constant and lose measurements to about 4 kbars pressure. The thermodynamic functions ΔV , ΔE , and ΔS_v characteristic of the association (hydrogen-bonding) will be determined from the pressure dependence of the equilibrium dielectric constant. ΔS_v in particular is expected to be sensitive to the size and shape of the molecules. Similarly, the activation parameters ΔS_v , ΔE , and ΔS_v will be obtained from the pressure dependence of the dielectric relaxation times. Variations in the molecular environment due to thermal expansion are eliminated when working at constant volume. Thus, when examining chemically similar liquids a comparison of the resulting data will be indicative of intrinsic molecular differences which may be correlated with the size and shape of the molecules. The first test liquids will be the lower aliphatic alcohols.

1.0080, SOLUBILITY OF NATURAL GASES IN CONNATE WATER AND OF WATER IN NATURAL GASES

N.O. SMITH, Fordham University, Graduate School, New York, New York 10458

The 'Solubility of Natural Gases in Connate Water and of Water in Natural Gases' is a continuation of NSF Grant GP-5066, and it is concerned with the solubility of natural gases in brine and the mechanism of intrastratal fluid flow in sedimentary rocks. Measurements of the solubility of CH₄, N₂ and He in water containing 1m NaCl from 50 to 125 degrees C at pressures up to 10,000 psi, have been made. Future work will include the solubility of C₂H₆, H₂S and CO₂ in similar brines under the above conditions of pressure and temperatures. A study of the water content of the coexisting gas phases will add to the scant knowledge of the vapor pressure of water over water and brine in geological environments, provide a much closer estimate of fugacities at high pressures than is presently available, and provide much needed data on the deviation from ideality of gas-water mixtures at high pressures.

SUPPORTED BY U.S. National Science Foundation

1.0081, GEOCHEMICAL STUDIES OF CONTINENTAL WATERS

W.S. BROECKER, Columbia University, Graduate School, Palisades, New York 10964 (AT(30-1)2493)

The purpose of this research is to gain an understanding of the factors controlling the major element chemistry of continental waters. We are contrasting the chemistry of three closed basin saline lakes, a sulfate-rich meromictic lake, and its associated ground waters, two fresh water lakes, lakes within active volcanic regions and subsurface waters in an island coral cap. Measurements of the major elements, pH, and pCO are being made on the lake waters, river and ground waters supplying the lakes, and pore waters extracted from the lake sediments. Stable and radioisotopes (C-14, C-13, Sr-90, Cs-137, Rn-222, ...) provide useful means of tracing sources and determining residence times. The origin of the detrital and authigenic phases in the sediments is also being studied.

A report regarding our study of Green Lake is in press (Limnology and Oceanography). Preliminary reports on our saline lake studies appear in this years Project Report.

1.0082, STRUCTURE OF CARBON-OXYGEN COMPLEXES

R.J. BOBKA, State University of New York, Graduate School, Plattsburgh, New York 12901

Objective: The objective for this research is to establish structures for surface oxygen complexes on carbon.

Background: Important commercial uses of various types of carbons as gas or water purifiers, ink coloring agents, rubber fillers and, recently, as fiber fillers in resin composites are markedly affected by the surface area, porosity and surface oxygen content of the carbon. The surface oxygen largely determines whether interaction with other substances will occur by physical or chemical adsorption or whether it will occur at all. For example, oxygen-free carbon is hydrophobic while carbon with surface oxygen is hydrophilic. Surface oxygen exists on carbon in carbon-oxygen complexes whose structures vary according to the method of their preparation. These structures can be studied with infrared spectrophotometry provided that the particle size of the carbon is an order of magnitude smaller than the wavelength of the radiation and the carbon-oxygen complexes are present in sufficiently high concentration. Both conditions are met with 'ultrafine graphite' which the applicant is able to prepare.

General Experimental Procedure: Carbon-oxygen complexes will be generated on ultrafine graphite under controlled conditions of atmosphere and temperature. The infrared absorption bands will be identified. The gross composition of the complexes will then be determined by thermal decomposition in a gas chromatograph and the infrared spectrophotometer, using a gas cell. Structural formulas consistent with both sets of observations will then be assigned.

1.0083, BEHAVIOR OF LIQUID SURFACES DURING EVAPORATION AND CONDENSATION

K. HICKMAN, Rochester Inst. of Technology, Graduate School, Rochester, New York 14608

The ultimate purpose is to evaluate the conditions that permit greatest rates of evaporation and condensation for unit area and driving force; and to enumerate or discover factors that interfere. Two general methods will be used: phase change at the surface of rapidly moving streams; and studies of the quietly evaporating stationary (stagnant) surface. The preferred instrument for the former will be the jet tensimeter and for the latter the floating liquid boule. Systems of Schlieren and high speed photography are being further perfected for recording the boule phenomena. The heat balance of the boule and surrounding liquid is being studied by collecting vapor concurrently from the surface of the boule, the surface of the supporting liquid and from the rim which terminates the shroud between the two. The high speed evaporation determined by the jet tensimeter is being increased by propelling the liquid jets at higher pressures thus decreasing the exposure interval of the surface from .001 seconds to .0001 seconds.

1.0084, STATISTICAL MECHANICAL THEORIES OF FLUIDS

F.P. BUFF, Univ. of Rochester, Graduate School, Rochester, New York 14627

It is the main purpose of this investigation to elucidate the interfacial structure of fluids from the triple point to the critical region by statistical mechanical theories. The problems include interfacial width criteria by thermodynamic techniques, a rigorous analysis of surface tension by the method of cluster diagrams and functional differentiation, an examination of density profiles by an extended van der Waals density gradient approach, utilization of capillary waves as a suitable set of collective coordinates for the calculation of leading moments of the interfacial distribution, examination of optical line shapes and explanation of the increased diffuseness of quantum fluids, as well as related problems. In order to compare these theories with optical experiments it is necessary to solve the equations for the E and H waves by means of Green's function techniques. It is also proposed to examine the surface properties of water and ionic solutions. The bulk properties of salt solutions will be studied by means of nearest neighbor functions. The structure of the electrical double layer will be investigated by means of charge fluctuation criteria to test models for the description of the inner Helmholtz plane.

1.0085, STUDIES OF THE PHYSICAL CHEMISTRY OF ELECTROLYTE SOLUTIONS

H. FRIEDMAN, State University of New York, Graduate School, Stony Brook, New York 11790

Statistical-mechanical methods are to be applied to these problems: 1. The calculation of the thermodynamic properties of the 'primitive model' of single and mixed electrolyte solutions with reasonable numerical accuracy at concentrations as high as 1 molar. 2. Calculation of the terms in the equivalent conductance of order $c \ln c$ and c , where c is the concentration, for unsymmetrical electrolytes and for mixtures, on the basis of the simplest (Debye-Huckel) model. 3. Calculation of nuclear-magnetic relaxation times in ionic solutions and their relation to transport coefficients, on the basis of the simplest model. 4. Study of the effects on all of the above of using more realistic models.

1. NATURE OF WATER

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0086, VOLUME CHANGES ON MIXING SOLUTIONS OF ELECTROLYTES

H.E. WIRTH, Syracuse University, Graduate School, Syracuse, New York 13210

The objective is to determine the apparent and partial molal volumes of electrolytes such as $MgCl_2$, $MgSO_4$, and $CaCl_2$ in binary mixtures with themselves and with other electrolytes such as $NaCl$, $NaBr$, KCl , and Na_2SO_4 . Most of the data will be obtained at 25 degrees C, but certain selected systems will be studied in the temperature range of 5 degrees - 40 degrees C. The concentration range will be from 0 - 4 molal. Some work will be done on ternary mixtures as well, with the ultimate objective of being able to compute the apparent and partial molal volumes of any of the above electrolytes in mixtures containing all others. A precision dilatometer capable of measuring directly the small volume changes occurring when solutions of electrolytes are mixed is the basic instrument used.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0087, TRANSPORT PROPERTIES OF CONCENTRATED SALT SOLUTIONS

G.J. JANZ, Rensselaer Polytechnic Inst., Graduate School, Troy, New York 12181

The objective of this research is to obtain data on kinetic properties, such as diffusion, viscosity, and conductivity of concentrated salt solutions. A system of 1:1 sodium salts will be chosen so that the kinetic properties of these systems can also be correlated by spectral means at higher concentrations and several different temperatures. The results will be interpreted to develop an improved understanding of ion-ion and ion-water interactions in concentrated salt solutions.

1.0088, DISSOLVED ORGANIC PHOSPHORUS IN NATURAL WATERS

E.J. KUENZLER, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514

The objectives of this proposal are to continue seeking techniques for identification of the major components of the dissolved organic phosphorus (DOP) pool in natural waters, to investigate the seasonal distribution of DOP compounds, and to examine the nature of the DOP eliminated into the medium by cultures of planktonic algae. The geographical and seasonal changes in total DOP are partially known but the chemical compounds making up these pools are completely unknown. Prior work has shown that the DOP present in natural sea waters consists of several important components. The DOP eliminated by healthy algae in pure culture also consists of several components but it is not yet known whether these are the same as occur in natural waters. Co precipitation on $Fe(OH)_3$ is used to remove DOP from sea water. The iron is then removed from the DOP by solvent extraction into acetyl acetone in CCl_4 . The organic substances are purified and concentrated, separated by paper chromatography, and detected by spray reagents or by radioautography. To date methods have been developed for concentrating, purifying, and separating organic phosphorus compounds from natural waters and from radioautography. To date compounds from natural waters and from unialgal cultures. The next steps are the final identification of these compounds, the delineation of their spatial and seasonal distributions, and investigation of their ecological significance.

1.0089, STUDY OF TOXIN SYNTHESIS IN SYNCHRONIZED PRYMNESIU

G.M. PADILLA, Duke University, School of Medicine, Durham, North Carolina 27706

Hemolysins from the euryhaline flagellate *Prymnesium* are preferentially synthesized at a salinity corresponding to that of 75% sea water. The hemolytic toxin appears to be localized in the membrane fraction of cell homogenates separated by sucrose

density gradient centrifugation. Initial purification by passage through Sephadex LH-20 indicates that the toxin has a molecular weight above 1,000. The extent to which glycerol enhances toxin synthesis is being investigated. The effect of illumination on the time course of toxin production is independent of the rate of protein and nucleic acid synthesis. Radioactively -labelled toxin fractions are being prepared so as to determine the biogenesis and chemical structure of toxins under closely controlled conditions of growth (e.g., light-dark cyclings). We plan to relate toxin synthesis to a specific major cellular function during the cell cycle by inducing cell division synchrony. Similar studies are being initiated with toxins from related marine algae of the genera *Gonyaulax* and *Gymnodinium*.

1.0090, THERMODYNAMICS OF MIXING OF SALT SOLUTIONS

H.L. ANDERSON, Univ. of North Carolina, Undergraduate School, Greensboro, North Carolina 27412

A research program designed to learn more about the nature of ionic interactions in aqueous solutions has been started at the University of North Carolina at Greensboro. The immediate goal of this investigation is to look at the role of solvent structure in influencing the thermodynamic properties of ionic interactions by measuring the heats of mixing at constant total ionic strength of a wide variety of strong electrolytes as a function of temperature (25 - 100 degrees Centigrade.) and concentration (0.1 - 1.0 molal). The initial mixtures to be studied will be binary electrolyte mixtures of the alkali and tetraalkylammonium cations in the presence of a common anion.

In order to make the above measurements, a high sensitivity calorimeter is currently being built.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0091, FIELD TECHNIQUES FOR CHEMICAL ANALYSIS OF WETLAND CRITERIA

V.A. ADOMAITIS, U.S. Dept. of Interior, Northern Pr. Wlfe. Res. Ctr., Jamestown, North Dakota

Objectives: To develop analytical techniques that will permit multiple chemical analysis of components necessary for the rapid evaluation of water and plant quality criteria. Techniques should be applicable to field conditions in isolated prairie or forest areas for waters ranging from 0-100,000 micromhos/cm².

Procedures: Translations from German will be made from *HELVETICA CHIMICA ACTA*, especially the work of Prof. H. Seiler, University of Basel, Switzerland, and from other scientific journals.

Translations from Esperanto will be made from *STUDOJ PRI AMELOJ DE LEGUMENOJ*, authored by Prof. S. Kawamura, University of Kagawa, Miketyo, Japan, and from other scientific journals.

The above and similar theoretical research work in physical chemistry and phytochemistry will be applied to practical ecochemical chromatography and colorimetry for highly alkaline prairie marshes and acidic forest bogs.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

1.0092, CHEMICAL CHARACTERIZATION OF WATERS OF PRAIRIE AND FOREST WETLANDS

V.A. ADOMAITIS, U.S. Dept. of Interior, Northern Pr. Wlfe. Res. Ctr., Jamestown, North Dakota

Objectives: To determine the general water quality characteristics, nutritional and toxic elements and other compounds present in prairie potholes and forest wetlands, and to determine the influences of such chemical factors on quality of waterfowl habitats.

Procedures: The following water quality criteria will be analyzed by gravimetric, titrimetric and colorimetric methods: alkalinity, chloride, chromate, copper, fluoride, calcium hardness, total hardness, iron, manganese, metaphosphate, nitrate, nitrite, orthophosphate, pH, silica, sulfate, turbidity, total dissolved solids, total residue and other analyses as required.

1. NATURE OF WATER

The following nutritional elements will be determined by atomic absorption spectrophotometric methods: barium, boron, calcium, cobalt, copper, iron, magnesium, manganese, molybdenum, potassium, sodium and zinc.

The following toxic elements will be determined by atomic absorption spectrophotometric methods: antimony, arsenic, beryllium, bismuth, cadmium, chromium, lead, lithium, mercury, nickel, selenium, silver, tellurium and thallium.

Nutritional and toxic compounds will be determined by various specific methods depending on the nature of the chemical knowledge obtained above.

A reference grid of water quality facts will be established for given geographic prairie and forest areas in the North Central States in order to support future research and management activities.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

1.0093, THE INVESTIGATION OF TRANSPORT PROCESSES IN AQUEOUS ELECTROLYTE SOLUTIONS

D.F. EVANS, Case Western Reserve Univ., Graduate School, Cleveland, Ohio 44106

I. Objectives of the Research (1) to determine the transport behavior of small molecules (non-electrolytes) in water and compare their behavior with that of electrolytes in order to establish the effect of ionic charge on the transport properties. (2) to elucidate the nature of ion-ion interactions in aqueous solution.

The first goal will be achieved by measuring the diffusion coefficients of small non-polar (e.g., rare gases and gaseous hydrocarbons) and polar compounds in water as a function of temperature. These measurements on non-polar compounds will subsequently be carried out in aqueous electrolyte solutions. The second objective will involve conductance measurements in two types of solutions: (1) aqueous solutions of new large ions and (2) solutions of multi-valent ions in heavy water. The conductance measurements will be directed towards giving information concerning ion association and should help resolve questions regarding the pattern of ionic association in water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0094, HETEROGENEOUS NUCLEATION AND CONDENSATION OF VAPORS

A.G. WALTON, Case Western Reserve Univ., Graduate School, Cleveland, Ohio 44106

Apparatus is being set up to examine the energetics of heterogeneous nucleation of vapors on mainly crystalline substrates. Studies of this type are designed to lead to a better understanding of the mechanism of condensation processes and to relate the observed critical supersaturations to the surface adsorption and diffusion processes. Vapors to be studied are water, benzene, cyclohexane and hydrocarbons; substrates include alkali halides and other single crystals, polymers and surface treated metals. It is hoped that the experiments will also form critical tests for current theories.

1.0095, ION-SOLVENT AND ION-ION INTERACTIONS IN AQUEOUS ELECTROLYTES

E. YEAGER, Case Western Reserve Univ., Graduate School, Cleveland, Ohio 44106

Research objectives are 1) to establish the effects of ions on the structural relaxation of water and to interpret these effects in terms of various models for water and aqueous solutions; and 2) to gain further understanding of the role of solvent molecules in multiple-step ion association-dissociation processes. The first will be pursued through the study of the effects of various electrolytes on ultrasonic absorption in the absence of chemical relaxation effects. The depression of absorption produced by large structure-breaking ions will be measured with Carstensen-type equipment, initially at 1 atmosphere and later at higher pressures. Such measurements together with partial molal volume and compressibility data will be used to obtain information concerning the effects of these ions on the equilibrium distribution of

structures in water and the structural relaxation times. The research on the role of solvent in ion association-dissociation processes will involve kinetic studies using principally the temperature-jump relaxation technique with laser heating. The volumes and energies of activation will be determined from the pressure and temperature dependence of the kinetic parameters.

1.0097, SOLUBILITIES OF THE SULFATES OF BARIUM AND STRONTIUM IN OILFIELD WATERS

A.G. COLLINS, U.S. Dept. of Interior, Petroleum Research Ctr., Bartlesville, Oklahoma

The solubilities of barium sulfate and strontium sulfate in synthetic and natural saline waters are determined by using sulfur-35 tagged salts. Thermodynamic parameters are calculated and empirical equations are developed using the experimentally derived data. This information is needed to develop better petroleum production methods.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

1.0098, SOLUTE PROPERTIES OF WATER

S.D. CHRISTIAN, Univ. of Oklahoma, Graduate School, Norman, Oklahoma 73069

Little is known about specific interactions between molecules and solute molecules or ions. The success we have had in elucidating self-association and hydration equilibria in organic solvents has been due in large measure to the application of several physical methods in studying each system. Our approach has also avoided the difficulty experienced in studies of aqueous systems where the preponderance of solvent-solvent interactions as opposed to solvent-solute are overpowering and has permitted us to progressively increase the polarity of the systems being studied.

This proposal outlines a program of research in which the solute properties of water will continue to be investigated. Spectral (infra-red, ultra-violet and nuclear magnetic resonance) colligative property, distribution and dielectric constant measurements will be made to determine the bonding and reaction characteristics of hydrates of polar species in non-aqueous media.

The range of physical methods to be applied will be enlarged where possible and we will place new emphasis upon qualitative information concerning the conformation of water aggregates and hydrates as well as continue our accumulation of quantitative thermodynamic data.

It is expected that the results of the proposed research will be important not only in increasing our understanding of the bonding properties of water, but also in developing improved theories of the hydrogen bond.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0099, MEASUREMENT OF THERMODYNAMIC PROPERTIES OF SALINE SOLUTIONS

A.M. ROWE, Okla. St. Univ. of Agr. & Sci., School of Engineering, Stillwater, Oklahoma 74075

Engineers must determine the thermodynamic properties of aqueous solutions containing various salts and other contaminants in order to design plants to purify water. The purpose of this work is to conduct the necessary experiments to obtain data for prediction of these thermodynamic properties over a wide range of temperatures and pressures. A heat of vaporization calorimeter and a

p-v-T cell will be used in the experimental phase of this program. Tests will also be conducted to measure the effect of various parameters on heat of vaporization over a wide range of temperature and pressure.

1.0100, KINETICS OF ADSORPTION VIA DOUBLE LAYER CAPACITY MEASUREMENTS

A.J. DIFENDERFER, Lehigh University, Graduate School, Bethlehem, Pennsylvania 18015

A method of measurement of the double layer capacity of a mercury electrode-saline solution interface is being used which depends upon the application of a linear voltage ramp to the electro-chemical cell. In the absence of electro-active material, the resulting current is directly proportional to the capacity current, thus permitting the recording of the entire curve in a fraction of a second (the time of the ramp).

This technique is being used to examine the effect of partially aqueous and non-aqueous solvent systems upon the electrical double layer. The adsorption of organic molecules is being studied as a function of these solvent changes as well as a function of the adsorbate.

For adsorption processes which are not diffusion controlled, a modification of the above technique will be used in an attempt to evaluate the rate of adsorption.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0101, IONIC SOLVATION

J.O. BOCKRIS, Univ. of Pennsylvania, Graduate School, Philadelphia, Pennsylvania 19104

Objectives: There is still some doubt as to whether a primary hydration number really exists for ions like those of the alkali metals (when there is no covalent bonding between the ion and water); there is no widespread acceptance of any particular measurement as the best one to use; and there is still a discrepancy of up to plus or minus 50 percent as to the 'correct' solvation number in a given case.

The objectives of the project, therefore, are to examine critically the validity of the concept of solvation numbers, determine the extent to which various methods yield results in agreement with this concept, and determine, accurately, meaningful solvation numbers.

Problems to be Studied: A wide range of different salts will be studied, under different conditions, by five methods: 1 and 2) Compressibility and Density measurements will give the sum of the solvation numbers for a salt, and provide a test of consistency. 3) Ultrasonic e.m.f.'s will give the difference of solvation numbers. 4) Proton Magnetic Resonance studies will give the life time of the solvation sheath molecules. 5) Raman Spectroscopy studies as a function of temperature will give the bond strengths and other information on the solvation shell, if this contains covalent bonds.

Supplementary measurements will be: i) The use of conductance measurements at high concentrations to deduce the degree of association. ii) The measurement of the pressure dependence of the self diffusion coefficient, to give information on the volume, hence constitution, of the hydration sheath.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0102, THE RELATION BETWEEN THE STRUCTURE AND PROPERTIES OF LIQUID WATER

H.S. FRANK, Carnegie Mellon University, Graduate School, Pittsburgh, Pennsylvania 15213

The purpose of this research is to attempt formation of Cox's ice and to study the differences in properties between freshly melted ice and freshly condensed steam.

This investigation will be approached by the compression and cooling of ice-water mixtures; far infrared, Raman and ultraviolet spectra will be used as functions of origin and thermal history of water samples.

1. NATURE OF WATER

Better understanding of the nature of solvent water can be expected to strongly assist in the attack on the problem of separating this solvent from salts dissolved therein.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0103, TRANSPORT AND DIELECTRIC PROPERTIES OF SALINE SOLUTIONS

R.L. KAY, Carnegie Mellon University, Graduate School, Pittsburgh, Pennsylvania 15213 (14-01-0001-1729)

Low frequency dielectric constants will be measured at pressures up to about 3,000 atmospheres and in the temperature range 0 degrees - 60 degrees C for heavy water, methanol, ethanol, acetonitrile, formamide or N-methylformamide, dimethylsulfoxide, and possibly n-hexane or carbon tetrachloride. Compressibilities will be measured for those liquids for which adequate data are not now available. A dielectric cell will be designed and constructed for the simultaneous measurement of both compressibilities and dielectric constants.

Ionic mobilities will be determined for selected salts in the above solvent systems at pressures as high as 4,000 atmospheres. These measurements will require transference data as well as conductance measurements. A new method has been devised for determining transference numbers at pressures as high as those contemplated here.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0104, THE EFFECTS OF NONELECTROLYTES AND SELECTED SALTS ON STRUCTURING IN WATER

E.M. ARNETT, Univ. of Pittsburgh, Graduate School, Pittsburgh, Pennsylvania 15213

Measurements will be made of the partial molal free energies, enthalpies, entropies and heat capacities that accompany the dissolving of specially selected compounds into water, aqueous saline solutions, and other suitable media such as heavy water. Criteria for salt selection will include importance as components of sea water, known influence on aqueous ordering and solubility in water. The experimental techniques will be solute distribution, calorimetry and spectroscopy. The results should make possible better understanding of solute-water forces and orientations in saline solutions.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0105, STUDIES BEARING ON THE RELATION OF STRUCTURE TO PROPERTIES IN LIQUID SOLUTIONS

H.S. FRANK, Univ. of Pittsburgh, Graduate School, Pittsburgh, Pennsylvania 15213

This is a continuation of work on aqueous electrolytes, of which the most recently completed items are the study of ZnSO₄ in H₂O and D₂O solutions, and the comparison of activity coefficients of 6 alkali halides in H₂O and D₂O. Under way are experiments, including ones using liquid junction cells, aimed at estimating single-ion activities, particularly of tetra-alkyl ammonium ions in their halide solutions. In addition, theoretical studies are continuing on thermodynamic models for liquid water and comparison of H₂O and D₂O as solvents both for salts and for non-polar solutes.

1.0106, EFFECT OF AMINES, ALCOHOLS AND PHENOLS ON THE PHYSICO-CHEMICAL PROPERTIES OF WATER

G.A. JEFFREY, Univ. of Pittsburgh, Graduate School, Pittsburgh, Pennsylvania 15213

We propose to study the effect of certain organic substances on the hydrogen-bond structure of aqueous systems. These organic compounds will be such as combine both hydrophobic and hydrophilic properties. The first compounds which will be studied are the alkylamines. This will be followed by investigation of systems involving alcohols and phenols. The experimental approach will be to determine the structures of any high hydrates which are formed, by single crystal diffraction methods. The

1. NATURE OF WATER

results will then be compared with the radial distribution function of the aqueous solution of the same composition, firstly at the melting point, then progressively further from this point, both with respect to temperature and composition. Liquid state X-ray diffraction studies will be used for this purpose. The possibility of using infra-red spectroscopic methods on the high hydrate crystal and their corresponding aqueous solutions will also be explored.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0107, FACTORS AFFECTING MINE DRAINAGE AND THE GROUND WATER INTERACTIONS IN SELECTED AREAS OF WESTERN PENNSYLVANIA (PART 1)

R.R. PARIZEK, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Rock and water samples were collected from two areas; one containing strip mines producing acid waters and the other yielding non-acid drainages. The samples were analyzed and compared to determine the compositional variations responsible for the divergent water qualities. The acid potential of a rock was related to its sulfur content by three leaching tests. These tests also evaluated the effect of pyrite crystallinity, rock type, iron bacteria and alkalinity on acid production. The hydrology of the two areas was approximated from measurements made on domestic wells of one area.

It was found that the ranges of total sulfur contents of the acid and non-acid areas were similar and could not account for the different water qualities produced. The leaching tests showed acid production to be partly dependent upon the sulfur content of a rock and greatly affected by pyrite crystallinity, iron bacteria and calcium carbonate. Ground waters in the unmined portions of the acid drainage area had low pHs; whereas those in the non-acid area were alkaline. Because iron bacteria prefer an acidic environment, the former area may harbor the bacteria while the latter may not. Consequently, the sterile areas may produce a milder acid which can be further reduced by the available alkalinity.

The hydrologic setting consists of alternating aquifers and aquitards in accord with the cyclicity which is characteristic of the rocks. Under certain circumstances acid mine drainage may be confined to surface water supplies.

1.0109, THE ANALYSIS AND GEOCHEMISTRY OF TRACE ELEMENTS IN THE HYDROSPHERE

J.T. CORLESS, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

An investigation of the chemical situation of trace elements in R. I. lakes, rivers, and Narragansett Bay has been undertaken. Routine procedures based on NAA and gamma spectroscopy have been developed for Cu, Mn, Ni, and Zn.

Results to date indicate: 1. Significant local and regional variations in trace element concentration and distribution exist within Narragansett Bay and the above mentioned river systems. A heavy trace metal load appears to be entering the head of the Bay. 2. Natural seasonal variations exist and may bear directly on the productivity cycle. 3. Neutron activation analysis offers an accurate and extremely sensitive tool for the study of trace elements in natural waters. The availability of tested and trusted

radioanalytical techniques for trace element analysis would greatly facilitate the task of the water chemist. 4. An important fraction of these dissolved trace metals exists in a chemical form which cannot be extracted by diethyldithiocarbamate until the sample is oxidized (organic complexes).

Future plans (1968-1970) call for a close examination of the partitioning of the trace elements among the particulates, dissolved-inorganic, and dissolved-organocomplex 'phase'. We plan to describe the role played by dissolved and particulate organic matter in the transport and deposition of trace elements. The distribution and partitioning of these trace elements within the water column will be correlated with seasonal cycles, phytoplankton succession, salinity, and other chemical variables. Analytical procedures for additional elements will be developed. The comparative trace metal chemistries of a natural and a polluted river will be investigated.

SUPPORTED BY University of Rhode Island

1.0110, BIOCHEMICAL OXIDATION OF HYDROCARBONS IN NATURAL WATERS

C.W. HOUSTON, Univ. of Rhode Island, Graduate School, Kingston, Rhode Island 02881

The proposed study involves the investigation of microbial degradation of hydrocarbons in natural waters. Although a great deal is known about the bacteria affecting health, relatively little is known about bacteria and biochemical processes that are fundamental to the assimilation of waste products that get into natural waters.

It is intended to evaluate factors which influence the clearance of hydrocarbons for natural waters by - 1. determining cultural conditions and composition in a natural water source and studying the dynamics of the system by a continuous culture study in a simulated environment; 2. investigating the role of co-oxidation phenomenon in the accumulation of toxic hydrocarbon intermediates; 3. correlating the amount, type and the degradation rate of hydrocarbons to seasonal and cultural parameters for the purpose of recommending a suitable decontamination policy.

1.0111, EFFECT OF DRAG REDUCING ADDITIVES IN WATER TRANSPORTATION

W.E. CASTRO, Clemson University, School of Engineering, Clemson, South Carolina 29631

The proposed research consists of laboratory studies directed at establishing the mechanisms involved in the friction reducing effect of small concentrations of certain polymeric additives in water. Once these mechanisms are clearly identified, they may then be applied to the general problem of drag. The proposed investigation will be conducted in two parts.

Part I - Fluid Properties: 1. Laboratory studies of the effect of drag reducing additives on viscosity, density, bulk, modulus of elasticity, surface tension, and thread formation of water-polymer solutions. 2. Degradation studies of additives by high shear-stress and solvent pH. 3. Laboratory study of a new drag reducing additive, okra gum.

Part II - Pipe Flow: 1. Pipe flow experiments with aqueous solution of drag reducing additives in fully developed laminar and turbulent flow. 2. Detailed investigation of the effect of additives on transition which includes measuring the growth and intensity of turbulent flashes and the effect of additives for both self-induced and mechanically generated flashes. 3. Development of an analytical model which will be useful for predicting drag reduction in other configurations.

1.0113, ENVIRONMENTAL RADIATION STUDIES

J.E. NOAKES, Oak Ridge Associated Univs., Oak Ridge, Tennessee 38117 (AT(40-1)-GEN-33)

The Oak Ridge Associated Universities' environmental radiation program was initiated in 1964 for the prime purpose of carrying out geochronology studies on marine sediments in the Gulf of Mexico.

Two analytical methods have been employed for sediment age measurement. A uranium daughter dating method, which entails the radiometric analysis of Th-230 and Pa-231, is utilized when dating silicious sediments of ages between 10,000 - 200,000 years. A second radiometric method utilizing radiocarbon measurements is employed for carbonate sediments whose age ranges are from recent to 40,000 years. Age measurements from both methods have shown that sedimentation rates for deep water Gulf sediments to be in the range of a few centimeters/ thousand years.

Current studies being carried out include (1) measurement of allogenic and authigenic Th-230 and Pa-231 in marine sediments (2) development of new analytical methods for the analysis of uranium, thorium, and protactinium in marine waters and sediments and (3) improvement in the radiocarbon method of dating for age measurements in the 40,000 to 57,000 year range.

SUPPORTED BY U.S. Atomic Energy Commission

1.0114, MOLLUSK STUDIES

D.J. NELSON, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee (W-7405-ENG-26)

Analyses of additional prehistoric Indian midden mollusk shells showed the higher strontium concentrations in these shells may be attributed to higher environmental concentrations of strontium in river water between 1000 and 2000 years old. It was hypothesized that this change was due to the imposition of an agricultural economy on a forested landscape decreasing levels of soil carbon dioxide concomitantly increasing the proportion of rainfall in direct runoff thereby decreasing percolating ground water. The strontium analyses were accompanied by analyses of barium, and potassium concentrations were changed but little. This study showed that the rates of movement of strontium, barium, and manganese in the environment changed within recent times. These results have implications for the long-term behavior of 90 Sr in the environment as well as maintenance of the mineral economy of our terrestrial environment.

1.0115, WATER RESEARCH PROGRAM - SECTION I, PROPERTIES OF SOLUTIONS

R.J. RARIDON, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee

The properties of solutions subprogram is intended to provide basic information on the thermodynamic and transport properties of aqueous and non-aqueous electrolyte solutions and on phase equilibrium. Thermodynamic measurements are carried out by various physical-chemical techniques including potentiometry, solubility measurements, distribution coefficient measurements, and vapor-phase equilibria, with emphasis on properties of concentrated solutions, multicomponent systems and aqueous-organic-electrolyte mixtures; there is special emphasis on measurement of solubilities of 'scale-forming' salts (CaSO₄) as a function of temperature and in various media. Diffusion coefficients are measured in concentrated aqueous solutions, water organic mixtures, gels, and membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

1.0116, ENVIRONMENTAL RADIATION STUDIES - EVALUATION OF FISSION PRODUCT DISTRIBUTION AND MOVEMENT IN TERRESTRIAL ENVIRONMENTS

T. TAMURA, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee (W-7405-ENG-26)

The purpose of this study continued to be the characterization of the behavior of critical radionuclides, such as 90Sr, 137Cs, 60Co, 3H, and selected transuranics, in soils, with emphasis on developing an understanding of observed responses as they relate to pedologic factors, weathering, and erosional processes. By establishing fundamental relationships between radionuclide behavior and soil properties, it should be possible to predict the behavior of radionuclides on different soil types, to predict the uptake of radionuclides in plants, and to be able to suggest remedial or countermeasures when needed.

The scope of this study includes: (1) defining the extent and mode of radionuclide movement off the soil surface by runoff and erosion and into the soil profile by infiltration using laboratory tests, small field plots, and well-defined watersheds; (2) defining causative factors primarily responsible for retention movement and fixation of critical radionuclides in soils; (3) examining the role of organic with particular emphasis on the surface horizons; and (4) developing models which will aid in predicting the behavior of radionuclides in related soil types. The nuclides will provide soil reaction information of agricultural and silvicultural importance and will be valuable for effectively utilizing soils for peaceful applications of nuclear energy.

Results of laboratory investigations of selective sorption of cobalt by minerals and soils reveal that hydrous sesquioxides, which are commonly present in these systems, play an important role. Minerals which had been around for size fractionation and then washed with water, salt, acid, or base released different amounts of components in the extracts, depending on the chemical solution and mineral species. Cobalt sorption by unground pure minerals and soil clay minerals was also investigated by saturating exchange sites with either sodium, magnesium, iron, or aluminum ions. These studies revealed that iron and aluminum saturation of minerals increased cobalt sorption as compared to minerals in their natural state.

1.0117, THE BASIC NATURE OF LIQUIDS

H.W. PRENGLE, Univ. of Houston, School of Engineering, Houston, Texas 77004

The purpose of the program is to investigate experimentally and mathematically the intermolecular potential field in which a given molecule moves by making infrared absorption and PVT measurements on certain liquids and observing the IR-shift (change in frequency) and configurational energy changes as a function of volume; pressures from 1 - 10,000 atm are being used.

The problem falls into the category of a 'many body problem' and one approach conceptually, as discussed by Ter Haar, is to find the self-consistent field in which the molecule moves, and thereby improve the field potential model.

Preliminary measurements were made in 1963-64 to determine the feasibility of the method, and the first part of the project was to construct a research IR-spectrophotometer with a grating monochromator to obtain the required resolution.

Presently, construction and calibration of the equipment has been completed and the first series of measurements following the C double-bond C (in 2-pentene) stretching frequency-shift in various liquid atmospheres, and at reduced volumes (by means of high pressures) are in progress. PVT isotherms, 30-250 degrees C, up to 1000 atm have been completed and isotherms up to 10,000 atm are in progress.

1.0118, STUDIES OF CONCENTRATED AQUEOUS ELECTROLYTES AND OF MOLTEN ELECTROLYTES BY INFRARED SPECTROSCOPY

R.E. HESTER, Univ. of York, York, United Kingdom

A program of research is proposed which will provide fundamental information on the nature of interionic and ion-solvent binding forces in aqueous electrolyte solutions and in molten electrolyte solutions. Primary emphasis is placed on the study of interactions of simple inorganic anions, including the halides, sulfate, carbonate, nitrate, phosphate, perchlorate, with a wide variety of metal ions, and on the role played by water in moderating these interactions. The techniques of vibrational spectroscopy will be used to study the changing symmetries of the polyatomic anions and of the metal complexes formed when inorganic electrolytes are mixed in the molten states and in aqueous solutions. Studies covering a wide range of temperatures and concentrations are proposed in order that infrared and Raman intensity measurements may be used to give values for the important thermodynamic quantities governing the interaction phenomena studied.

1.0120, SPATIAL DISTRIBUTION OF CHEMICAL CONSTITUENTS IN GROUND WATER

W. BACK, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

One of the topics in geology and hydrology that has been extensively studied, but that is not well understood, is the solution and precipitation of carbonate rocks. Many laboratory studies have been made on the solubility of calcite, some on aragonite, and few on magnesium-calcium carbonates. Field work related to this topic has been almost entirely related to the origin of limestone caverns and the formation of dripstone deposits. No comprehensive study has been made of ground-water problems, such as the processes that produce solution channels, their subsequent filling, and the chemistry of the water. A fresh approach to this question is now feasible through the application of electrochemistry and thermodynamics.

This project is part of a current broad field of study to determine if exact thermodynamic models can be used to describe the relationships between minerals and aqueous solutions. Models can be developed, but certain parameters significant for use of these models must be measured in the field. If the model can exactly describe the field relation, then a correct explanation for the solution and precipitation processes and the resultant chemical characteristics of the water and the chemical and physical characteristics of the rocks has been obtained.

1.0121, NITRATE DETERMINATION USING CHROMIUM (II) COMPLEXES

J.G. MASON, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

The determination of nitrate by usual methods is subject to interferences by nitrite and hydroxylamine and is not readily adapted to automatic operation. The objectives of the proposed research are: (1) To develop a rapid, accurate, and selective electrochemical method for the determination of nitrate in water in the presence of nitrite and hydroxylamine using electrogenerated Cr(II) complexes as reducing agents. (2) To explore the extent to which such a technique could be automated. (3) Elucidate aspects of the mechanism of the reduction of nitrate to hydroxylamine to ammonia by Cr(II) complexes.

1.0122, ADSORPTION OF ORGANIC COMPOUNDS ONTO SOLIDS FROM AQUEOUS SOLUTIONS

J.P. WIGHTMAN, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

The proposed research involves a study of factors effecting adsorption of organic compounds from aqueous solution. The compounds selected for study contain functional groups representative of water contaminants. Several solids of different surface energy will be studied.

The surface area, surface constituents, and structural elements of each solid will be established. The measurement of the amount of organic compound adsorbed and the heat of adsorption is proposed.

The results should ultimately support a model for solution adsorption by which predictions concerning the selectivity of adsorption of a given compound in water by a given solid could be made.

1.0123, DETERMINATION OF BULK DENSITY & WATER CONTENT OF SOIL THRU MEASUREMENT OF RADIATION ATTENUATION AT TWO DIFFERENT GAMMA ENERGIES

W.H. GARDNER, Washington State University, School of Agriculture, Pullman, Washington 99163 (AT(45-1))

Development of equipment and techniques is proposed for concurrent measurement, using attenuation methods and two radiation sources of different energy, of soil bulk density and water content in soil columns in the laboratory and in soil in the field. Preliminary experimental work and analyses indicate probable precisions (standard deviation) in bulk density measurement ranging from 0.003 to 0.006 g/cm. and somewhat better precision in water content. These values are obtained using radiation source strengths sufficient to give 106 counts/min. through a 0.1 x 1 cm. collimating slit and empty soil container and for 5 to 10 cm. soil columns and counting for 1 minute. Further investigation of gamma source combinations and of collimation and shielding is required. Additionally, studies are needed for other factors such as precision needed in mass attenuation coefficient and soil column thickness (or access tubing spacing) measurements. Problems in variation of chemical properties of soil from place to place and their effect on mass attenuation coefficients also must be investigated.

Need for non-destructive concurrent measurements of soil bulk density and water content exists in a variety of experimental work both of applied and fundamental nature. A practical technique would have wide application.

2.0001, CHARACTERIZATION OF DYNAMIC PROPERTIES AND PHYSICAL CONDITIONS OF SOIL IN RELATION TO TILLAGE AND TRACTION

W.R. GILL, Auburn University, National Tillage Mach. Lab, *Auburn, Alabama* 36830

Object: To determine and measure the static and dynamic physical properties and conditions of soil which are of importance in the design and operation of tillage and traction devices and required for plant growth

Plan of Work: The triaxial shear apparatus provides a means for applying controlled stresses to volume elements of soil so that basic dynamic behavior can be measured and correlated with applied stresses. The mathematical relations between stresses and soil deformations will contain parameters whose values will depend upon certain physical properties of the soil. The measurement of soil behavior in various conditions will permit the characterization of soil by means of these parameters. Simple tillage tools will also be used to apply forces to soil and basic dynamics of behavior will be correlated with stresses to develop basic behavior equations that can be used in a soil-machine mechanics.

An environment chamber will be used to provide the means for controlling environment during the growth of plants. With this chamber the basic behavior of plant roots in different soils and conditions will be observed to evaluate the factors limiting plant root growth. Descriptions of the plant, soil, and environment will be developed to characterize soil conditions required for tillage and plant growth. These descriptions will be used to develop soil-plant and soil-machine mechanics and to evaluate the effect of tillage and traction on soil condition. It is estimated that three professional man-years per year will be used on this project.

2.0002, CORRELATION OF SOIL SURFACE AND RAINFALL-RUNOFF-MOISTURE RELATIONSHIPS ON AGRICULTURAL WATERSHEDS ON COASTAL PLAINS SOILS (ABBREV)

J.G. HENDRICK, Auburn University, School of Agriculture, *Auburn, Alabama* 36830

Objectives: 1. To investigate soil surface characteristics such as roughness, strength, surface sealing and tilth as a means of determining infiltration and percolation rates of soils as an aid in evaluating watershed surface runoff, water yield and groundwater recharge. 2. Investigate the influence of type and extent of cover on absorption of water by the soil.

Salient Points: 1. Laboratory studies will be conducted in investigating relationships between soil strength, bulk density and infiltration and permeability for bench mark soils. 2. Rainfall simulator studies will be made to investigate the effect of type and percentage of cover upon infiltration and runoff rates for bench mark soils. 3. Knowledge gained in objective 1 and 2 will be utilized in field studies to determine if relationships developed are valid. 4. After determining some reliable measure of soil surface vs water absorption characteristics, small watersheds will be instrumented to measure rainfall-runoff-antecedent moisture-water table relationships. These instrumented watersheds will be utilized in developing techniques to explore water movement into and through the zone of aeration and into the water table.

2.0006, EVALUATION BY TEST DRILLING OF GEOPHYSICAL PROSPECTING FOR GROUND WATER IN THE PIEDMONT AREA, ALABAMA

J.C. WARMAN, Auburn University, Water Resources Research Inst., Auburn, Alabama 36830

This study proposes to evaluate by test drilling the results of research completed June 30, 1966, under OWRR Project B-003-ALA, 'Geophysical Prospecting for Ground Water in the Piedmont Area, Alabama.' Included will be construction of test wells in 10 of the 25 prospective areas identified in Project B-003-ALA, completion of pumping tests on 6 of the wells, and analysis of the non-biological chemical constituents in the ground water. It is impossible to evaluate geophysical interpretations without test drilling. A more complete evaluation might include construction of test wells at each of the 25 prospective areas; however, we be-

lieve that drilling 40 per cent of the prospective areas and incorporating this data with records available from 6 water wells and core holes in the project area will allow a reliable evaluation and will avoid unnecessary expense. Drill cuttings, well construction records, and test pumping data will be made a part of the permanent files of the Geological Survey of Alabama and thus be available for other studies. If proven successful, the use of geophysical techniques in the Piedmont area will enable more complete development of available ground water resources and reduce the cost of exploration and development.

2.0007, DEVELOPMENT OF CRITERIA FOR TILLAGE MACHINERY THAT WILL REDUCE SOIL EROSION AND RUNOFF

A.W. COOPER, U.S. Dept. of Agriculture, Auburn, Alabama

Object: To obtain engineering information useful in the development of new and improved equipment and machinery for soil and crop management.

Plan of Work: Field and laboratory experiments will be conducted to determine the effect different tillage machinery and practices have on seedbeds. Inputs of time, labor and power for various tillage systems will be determined and used in rating these systems. Attention will be given to methods and instruments for measuring soil surface roughness; and the relationship between roughness and surface water retention will be ascertained. Criteria for equipment needed for various soil and water conserving practices will be developed. Models will be used to predict the forces acting upon tools being operated in the soil, the behavior of the soil, and the effects of the operating tools on the soil. The studies will include work on cultivating machinery as well as primary tillage machinery.

2.0008, AQUIFER PERFORMANCE TESTS UNDER TWO PHASE FLOW CONDITIONS

H.R. HENRY, Univ. of Alabama, Water Resources Program, University, Alabama 35486

This is a project with two parts. The first part is a laboratory model constructed and developed to study the effects of two phase flow conditions. The second part is a test phase conducted on a water-well field under actual field conditions. The laboratory studies of part 1 will consist of fundamental studies placed in the framework of aquifer dynamics under two-phase conditions. The principal group of experiments will consist of air entrainment studies in well aquifer system by blocking of flow channels by entrained air during intermittent operation. The problem is particularly severe in the recharge case. The laboratory set-up will consist of a model of a portion of an aquifer. The laboratory model will be operated to cause air entrainment in a manner to correspond to field operation. Flow rates, pressures in the well and aquifer and velocities by tracer movement will be measured to determine the change in apparent characteristics of the well and aquifer when air is entrained.

The field study of part 2 will consist of checking the results of part 1 under actual field conditions by conducting aquifer performance test on wells drilled and developed in an aquifer underlying the campus of the University of Alabama. Twelve wells of different depths and diameters will be drilled and developed in an aquifer whose geology and hydrology are known. The wells will be located in an array which will fully penetrate the aquifer and cover the extent of the well field. Field and laboratory tests will be correlated.

2.0009, THE DEVELOPMENT OF GEOCHEMICAL AND GEOPHYSICAL TECHNIQUES AS AN AID TO DETERMINING AVAILABILITY OF GROUND WATER IN LIMESTONE TERRANES

P.E. LAMOREAUX, Univ. of Alabama, Graduate School, University, Alabama 35486

This study is on the effectiveness of geochemical and geophysical techniques in determining the location, quantity, and quality of ground water in massive limestone beds. These limestone beds are the principal source of water for most uses in the Tennessee Valley. Ground water occurs in solutionally enlarged openings along bedding and joint planes of the limestone. Industrial expansion and the resulting increase in population and water use indicate the need for more effective methods to determine the occurrence and availability of water in a limestone terrane.

Previous studies indicate that the location and alignment of large-capacity wells and springs in this area are related to factors of geochemistry, topography, geologic structure, stratigraphy, and the thickness of the unconsolidated material overlying the limestone bedrock.

The proposed study will apply geochemical techniques to determine: zones of high permeability and their alignment in the limestone terrane, relation of quality of water to geologic structure, recharge and discharge areas, character and thickness of soil layer, proximity to principal water-bearing solution and fracture systems, periods in water year, and surface-water flow patterns. The geophysical studies will determine the position of the water table and the thickness and type of unconsolidated material overlying the bedrock, the location, alignment, and development of sinkholes, and delineation of potential zones of high permeability in the bedrock. Preliminary investigations indicate that soil thickness and type have a greater bearing on the quantitative aspect and approach to ground-water studies in limestone terranes than formerly realized; therefore, detailed studies of this aspect of the project area include drilling for control purposes.

2.0011, GEOHYDROLOGY OF THE ANCHORAGE AREA, ALASKA

W.W. BARNWELL, U.S. Dept. of Interior, Water Resources Division, Anchorage, Alaska

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Alaska.

Purpose - To assemble and integrate the facts about the Greater Anchorage hydrologic systems which will be used by city and borough planners for designing an orderly development of the water resources.

Methods - Approximately 4 years of records from 30 stream and lake gages will be obtained. Seasonal and yearly runoff from major streams from the Eklutna River on the north to Twenty Mile River on the south will be evaluated. Samples of ground water and surface water will be collected for chemical analysis to

identify changes in chemical quality which result from use of the water resources. Several thousand feet of test drilling, borehole and areal geophysical techniques, and a study of surface and subsurface geology will be used to define geologic boundaries of ground water basins. Test pumping and infiltration studies will be used to determine the hydrologic properties of the aquifers. Dyes or other tracers will be used to determine the direction and velocity of ground-water movement.

2.0012, WATER RESOURCES OF THE KENAI PENINSULA BOROUGH AREA, ALASKA

S.H. JONES, U.S. Dept. of Interior, Water Resources Division, Anchorage, Alaska

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Alaska.

Purpose: To provide facts concerning the water resources of the Kenai Peninsula Borough for planners to use in designing procedures for orderly development of the water resources.

Methods: Stream and lake gages will be installed to evaluate seasonal and yearly runoff from major streams. Surface and subsurface flow of water into and out of the area and changes in chemical quality of water resulting from water use in the area will be defined. Sediment discharge of the streams will be determined. The geologic boundaries of the ground-water basin will be defined, and aquifers identified by a study of surface and subsurface geology.

2.0013, SCOUR AT BRIDGE CROSSINGS IN ALASKA

L.S. LEVEEN, U.S. Dept. of Interior, Geological Survey, Anchorage, Alaska

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Alaska.

Only meager information is available on scour of alluvial channels at constrictions and no generally accepted method of predicting depth of scour is presently available. The objective of this project is to develop general relationships between observed depth of scour and measurements of the associated hydraulic and sediment transport variables at selected bridge crossing in Alaska.

The project is designed to obtain detailed information on the cross sectional and longitudinal profile of the streambed utilizing echo sounders from a boat; and to provide measurements of hydraulic and transport variables such as the vertical velocity and sediment distributions, stage-discharge and depth-discharge relationships and particle size of suspended sediment and bed material. The results of this investigation will complement laboratory experiments and aid in understanding the mechanics of scour around bridge piers and abutments.

2.0014, WATER RESOURCES OF THE GREATER JUNEAU BOROUGH, ALASKA

J.A. MCCONAGHY, U.S. Dept. of Interior, Water Resources Division, Anchorage, Alaska

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Alaska.

Purpose - To describe the hydrologic system in the Greater Juneau Borough so that city and borough planners can design procedures for orderly development of water resources.

Methods - An inventory will be made of selected wells and an observation well network will be established to observe water level changes. The bedrock-surficial deposits contact will be mapped and test holes will be drilled in the surficial deposits. Geophysical techniques will be used in the examination of wells and test holes. Pump tests will be performed using wells in the surficial deposits aquifer.

2. WATER CYCLE

Low flow in streams will be determined and a network of eleven gaging stations will be maintained. Sediment load of selected streams will be correlated with discharge. Samples will be selected for chemical analysis.

2.0015, COASTAL AND INSHORE OCEANOGRAPHY

H.E. BRUCE, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

This project is a comprehensive study of the chemical, biological, and physical oceanography of selected estuarine environments in Southeast Alaska.

The objectives are to describe the general physical, chemical, and biological oceanographic conditions of the inside waters of Southeast Alaska and the seasonal and annual variations in these conditions. The oceanographic work is done in conjunction with other investigations of the Auke Bay Laboratory (Marine Biological Investigations and Shellfish Investigations) and with the Federal Water Pollution Control Administration and the University of Alaska. The combined effort by the above groups resulted in detailed 'ecosystem studies' of selected areas.

The oceanographic studies are broken down into physical and descriptive oceanography and chemical and biological oceanography which results in an over-all comprehensive program in oceanography. Biological oceanography includes studies in phytoplankton ecology, taxonomy, primary and secondary productivity, and energy transfer from the primary producers through the primary herbivores. Also included are studies on dissolved and particulate organic materials and their relations to primary and secondary trophic levels and to benthic organisms.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0016, BRISTOL BAY ESTUARINE ECOLOGY

C.J. DICOSTANZO, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

During the past few years intensive work has been done on the freshwater and the high seas phases of the life history of the sockeye salmon. Recent work has indicated that the ocean survival rates may not be nearly as constant as formerly thought and that estuarine conditions strongly influence these rates. Thus it seems necessary to supplement the freshwater and oceanic studies with investigations into the ecology of the sockeye salmon in estuarine areas.

The early phase of this study will be largely exploratory in nature. The objectives are: 1. To delineate the water masses within the Bristol Bay area and determine the physical and chemical features of the estuarine and adjacent coastal waters. 2. To determine the pattern of movement and distribution of smolts from the parent river into the estuary and ocean waters. 3. To determine the growth and survival of smolts as they pass through this transitional phase of their life cycle.

The first full season of study will utilize aircraft and radiometer to delineate water masses in Bristol Bay.

More specific oceanographic studies will be conducted from a surface vessel. It is expected that much time will be spent in assembling gear and developing standard stations and technique. Sampling of juvenile salmon will be accomplished with various kinds of gear, including tow net, trawls, seines, and gill nets.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0017, ESTUARINE STUDIES OF SOUTHEASTERN ALASKA

J.B. KIRKWOOD, U.S. Dept. of Interior, Biological Laboratory, Auke Bay, Alaska

One of the aims of the Auke Bay Biological Laboratory is to accumulate detailed descriptive information on environmental characteristics of several estuarine environments within the inside waters of Southeastern Alaska, and to explain ecological reasons for some of the observed differences between environments. The ecological differences are undoubtedly responsible for the annual fluctuations and distributions and abundances of commercially valuable fish and shellfish species.

It is apparent that descriptive knowledge of local populations and their environments are not sufficient in themselves to provide a clear concept of basic ecological and biological principles controlling an ecosystem however, such knowledge is a prerequisite to planning and conducting more detailed and intensive studies of discrete ecological and biological problems.

A cooperative study was initiated in April 1967 that will involve Oceanography Investigations, Marine Biological Investigations, Shellfish Investigations of the Auke Bay Biological Laboratory, and outside agencies such as Federal Water Pollution Control Administration and the Institute of Marine Sciences, University of Alaska.

Each group submits a separate description of its proposed participation in the cooperative estuarine study. The shellfish investigations study involves the following objectives: (1) To determine species composition and relative abundance of pelagic and benthic invertebrates. (2) To determine the relationship between species composition, distribution, abundance, and the environment.

2.0018, A STUDY OF THE FREEZING CYCLE IN AN ALASKAN STREAM

C.S. BENSON, Univ. of Alaska, Geophysical Institute, College, Alaska 99735

The research which will be assisted by the equipment and logistics provided is in the area of stream icing. The physical properties of the stream ice and its overlying and adjacent snow cover will be studied both in the field and laboratory. The equipment is for obtaining, storing and experimenting with samples of the snow and ice. The equipment and logistics mainly provide for winter sampling.

2.0019, CLAY-INORGANIC AND ORGANIC-INORGANIC ASSOCIATIONS IN AQUATIC ENVIRONMENTS

D.W. HOOD, Univ. of Alaska, Inst. of Marine Sciences, College, Alaska 99735 (AT(04-3)-310-3)

The overall objective of this year's proposed research is to further our understanding of the chemical processes that accompany passage of sediment systems from glaciers to form marine sediments and the ancillary chemical effects of such processes on the local oceanographic environments. As in the past, the prime emphasis will be on the trace metal associations both in organic and inorganic processes. This year's emphasis is on studies of the trace metal exchange equilibrium between the various size fractions of the suspended minerals and the water. The effect of organic material on this exchange will also be investigated. Analysis will be made by neutron activation techniques. In addition, concerted effort is being made to fractionate the organic matter previously found to contain significant quantities of Cu and Zn. Reverse osmosis and sephedex techniques are being employed.

Mineralogical data for both suspended and deposited sediments are complete for Taku estuary and is in press in Marine Geology. No evidence for major diagenetic changes in the minerals was observed in the estuary. The exchangeable cations on suspended sediments after contact with sea water show markedly different composition. The significance of this to flocculation processes is under study. Organic association with copper in an extractable form has been found and reported in 'Nature'. Other associations with a non dialyzable fraction have been found and are now being characterized.

SUPPORTED BY U.S. Atomic Energy Commission

2.0020, DISTRIBUTION OF DISSOLVED IONS IN ALASKAN WATERS

C.M. HOSKIN, Univ. of Alaska, Graduate School, College, Alaska 99735

Water, in the form of ice, meltwater streams and lakes, and sediment are closely related in the valley glaciers of southeastern Alaska. As these glaciers flow down their valleys, new sediment

2. WATER CYCLE

particles are produced by grinding of the valley bedrock into gravel, sand and mud. During the grinding process, some of the rock is dissolved and possibly mud particles contribute most because of their small size and consequent potentially great chemical reactivity. This project will investigate the water and sediment of Alaskan valley glaciers, attempting to learn about the relationships between; (1) the kind of rock being ground up (igneous, sedimentary, metamorphic) and the dissolved substances released into the meltwater from each kind of rock, and (2) the kind of rock being ground up and the resultant particles sizes produced. Certain dissolved substances and the resultant particles sizes produced. Certain dissolved substances as iron, calcium and magnesium and large amounts of suspended sediment can restrict the use of water and thus it is hoped that the data obtained from this research will aid in the evaluation of glacial meltwater usage.

2.0021, THE EFFECTIVENESS OF CONTACT FILTER FOR THE REMOVAL OF IRON FROM GROUND WATER *W. KIM, Univ. of Alaska, Inst. of Water Resources Res., College, Alaska 99735*

The objective of the proposed study is to explore the applicability of the contact filter in the removal of iron from ground water. A contact filter process developed by Minz in Russia consists of a deep sand bed (six feet) through which coagulated suspension is passed in upward direction. Theoretically this process should perform better than conventional sand filter due to the decreasing grain size of filter media in the direction of flow, and due to the greater depth effective in the filtration. Iron removal from ground water requires the oxidation of ferrous iron, and flocculation and separation of ferric precipitate. The contact filter may promote not only flocculation and separation steps but also the oxidation of ferric ion due to the intimate contact of iron-coated filter media with the incoming water.

The relative effectiveness of the contact filter and conventional sand filters, the optimum media characteristics will be determined by running pilot filter tests under controlled conditions.

2.0022, THE EFFECTS OF EXTREME FLOODS AND PLACER MINING ON THE BASIC PRODUCTIVITY OF SUBARCTIC STREAMS *J.E. MORROW, Univ. of Alaska, Graduate School, College, Alaska 99735*

Disastrous floods in early August, 1967, wiped out the bottom fauna of Faith and McManus Creeks near Fairbanks. As late as September 5, 1967, (last date of sampling) there was no sign of recovery. The bottom of these creeks will be sampled at selected stations and intervals to determine the rate of recovery and relative composition of the bottom fauna. Recovery and composition will be related, if possible, to substrate, basic productivity, meteorology and presence or absence of placer mining activity.

Bottom sampling will be done with a Surber sampler and graded screens, productivity will be measured by the C14 technique. Sampling patterns and frequency will be established by appropriate statistical methods.

2.0023, FOREST AND BOG OF SOUTH COASTAL ALASKA - INTRATYPE VARIATION AND ASSOCIATED HABITAT FEATURES *B.J. NEILAND, Univ. of Alaska, Graduate School, College, Alaska 99735*

This project is a continuation of investigations of south coastal Alaska vegetation that were begun in 1962. Part of the earlier project included intensive analyses of stands of forest and stands of bog in widely scattered localities in southeastern Alaska.

Phytosociological ordinations were developed for the stands of each vegetation type; various attributes of individual species behavior, behavior of groups of species of known or suspected indicator value, the few environmental measures that had been included, etc, were plotted against these ordinations; and hypotheses were developed as to the major factors with which these vegetation varies.

The major purposes of the present work are to ascertain the validity of the proposed hypotheses, to attempt to find the factors of importance in the patterns if the hypotheses are not correct, and to obtain further phytosociological information to refine the original ordinations. Investigations are being made of (1) for forest: drainage patterns, possible sources of soil water, soil profiles, pH, and various nutrient elements; and (2) for bogs: height of the water and sulfide layers, erosion features and drainage patterns, sources of surface water, upper peat profiles, and various chemical and physical characteristic of bog waters and peat.

SUPPORTED BY U.S. National Science Foundation

2.0024, SOIL HEAT TRANSFER - PERMAFROST AND FROST PENETRATION *H.R. PEYTON, Univ. of Alaska, School of Engineering, College, Alaska 99735*

The results of this work will provide engineers with specific methods of solution for some of the soil heat transfer problems which must be solved for effective utilization of the northlands. These methods will incorporate two aspects; (1) useful methods for the determination of thermal properties of soils, and (2) computer techniques permitting solution to problems too complex for standard mathematical model methods.

2.0025, PREVENTION AND CONTROL OF CULVERTS AND ROAD ICINGS

UNKNOWN, U.S. Army, Cold Reg. Res. & Engin. Lab., Fort Greely, Alaska

Objective: To develop criteria and techniques for the prevention and control of icing in culverts and on roads by means of proper location, protective devices or heating arrangements.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.
Alaska State Government

2.0026, RESTORATION AND REHABILITATION OF EARTHQUAKE DAMAGED PINK AND CHUM SALMON STUDIES IN PRINCE WILLIAM SOUND *P.S. ROYS, State Dept. of Fish & Game, Juneau, Alaska*

Major Overall Objectives: (1) Restoration of earthquake destroyed pink and chum runs in Prince William Sound. (2) Rehabilitation of spawning areas where production has been seriously curtailed.

Initial Objectives: (1) Biological and Engineering studies on 12 major streams in the subsided zone and 43 major streams in the uplifted zone. (2) Monitor streams to which restorative measures were applied during June 1967.

Procedures: (1) Engineering studies of priority streams to determine drainage area; maximum-minimum volumes of flow; flow velocities; bottom composition; bed load; contours; profiles; cross-sections; silt content; and rate of erosion followed by topographic mapping of study sections. (2) Biological studies of priority streams to determine spawning areas utilized by brood distribution within predetermined zones; measurements of spawning areas utilized; lost and gained; sex ratios; egg retention; scale samples; temperature; pH; subsequent egg deposition; and sequential fry production.

Alaska State Government

2.0027, CONTROL OF EROSION AND SEDIMENTATION ASSOCIATED BUILDING AND LOGGING *A.E. HELMERS, U.S. Dept. of Agriculture, Juneau, Alaska*

2. WATER CYCLE

Object: To determine factors related to erosion and mass soil movement; to develop measures to minimize soil movement and to rehabilitate damaged watersheds; and to determine the effects of logging and other land uses on salmon spawning streams and how to effect improvements.

Plan of Work: Pre-logging and post-logging relationships will be developed on experimental watersheds to study post-logging behavior. Variables to be investigated are a (1) flow characteristics of southeast Alaska streams, (2) stream channel character as affected by log jams and high flows, and (3) water quality in terms of stream temperature and quantity of organic and inorganic suspended sediment. Erosion causes and sources will be studied.

SUPPORTED BY U.S. Dept. of Agriculture

2.0028, TOPOGRAPHIC INFLUENCES ON PRECIPITATION

T.R. CANTINE, U.S. Dept. of Interior, Alaska Power Admin., Juneau, Alaska 99801

The study was initially undertaken to define precipitation intensities representative of higher elevations in Southeast Alaska for design storm studies. The local concentration of sea level climate stations and streamgages, together with nearby research programs of the Northern Forest Experiment Station, created an opportunity to examine area-wide variations in precipitation with a relatively small expansion in the data collection program. The program is still in the exploratory stages, but there are good indications that study results will be useful in estimating precipitation intensities and runoff for ungaged areas throughout Southeast Alaska.

SUPPORTED BY U.S. Dept. of Interior - Alaska Power Adm.

2.0029, CLIMATE RELATED TO PLANT RESPONSE IN THE MATANUSKA VALLEY

C.I. BRANTON, Univ. of Alaska, Agricultural Experiment Sta., Palmer, Alaska 99645

To collect, collate, analyze, and interpret climatic parameters related to plant response in Alaska's Matanuska Valley, with particular reference to net solar radiation received, moisture evaporation rates, and soil temperature.

Description of Work: The following meteorological series will be continued: (1) Maximum and minimum air-temperatures (2) Precipitation (rain and snowfall) (3) Gross radiation (pyrheliometer) (4) Net pan evaporation (5) Continuous wind velocity and direction (6) Evaporation and transpiration losses. (7) Humidity (wet and dry bulb temperatures). The following new series will be initiated in 1961: (1) Soil temperatures under various ground covers (2) Net radiation (Beckman & Whitley radiometer) (3) Net evaporation (from free water surface and Bellanca plates).

Alaska State Government

2.0030, RESPONSE OF ALASKA'S ADAPTED CROPS TO SUPPLEMENTAL WATER

C.I. BRANTON, Univ. of Alaska, Agricultural Experiment Sta., Palmer, Alaska 99645

To develop more precise information about the response to supplemental water of crops adapted to Alaska including, but not limited to, interactions between silt mantle thickness and fertility levels, definition of and interaction with other associated environmental parameters, estimates of irrigation input costs and probable returns, and evaluation of alternate irrigation water sources.

The study will continue over a fairly broad front, and will be conducted over a sufficient number of years to supply estimates of seasonal variability.

SUPPORTED BY U.S. Dept. of Agriculture
Alaska State Government

2.0031, FACTORS AFFECTING THE QUALITY OF ARIZONA MELONS

W.D. PEW, Univ. of Arizona, Agricultural Experiment Sta., Mesa, Arizona

Nutritional requirements: Nitrogen, chemical tissue tests (nitrate content of leaves and petioles) from plants grown on a wide range of available soil nitrogen are examined in relation to yields.

Irrigation requirements: Irrigation schedules based on Irrometer readings are applied to create plots of varying moisture levels and interactions between moisture levels and stage of plant development, yield, quality, etc. will be measured in relation to irrigation patterns.

Diseases: Observational notes relative to crown blight - a disease the cause or cure of which is unresolved - are taken in the course of other specific tests to provide data for the crown blight problem.

SUPPORTED BY U.S. Dept. of Agriculture
Arizona State Government

2.0032, LETTUCE PHYSIOLOGY

W.D. PEW, Univ. of Arizona, Agricultural Experiment Sta., Mesa, Arizona

To gain additional information relating to the physiology and environmental factors influencing growth behavior of lettuce in order to develop cultural measures that will improve production and quality. Among these factors are: planting data in relation to fall temperatures, irrigation levels and frequencies, fertilization rates, methods, and kinds of materials, previous cropping history, and cropping systems and the use of animal manures. Each of these is to be studied so as to give growth conditions that will result in less loss from premature seeding, larger percentage of solid heads of the desirable sizes, earlier maturity for earlier shipments in the fall and later shipments in the spring.

Description of Work: Irrigation levels: Varying levels of soil moisture based on Irrometer readings are maintained and interactions between soil moisture level, and sand stage of plant development are created. Effects of yield, quality and maturity are obtained from the test plots.

SUPPORTED BY U.S. Dept. of Agriculture
Arizona State Government

2.0033, SOIL WATER MOVEMENT IN RELATION TO THE CONSERVATION OF WATER SUPPLIES

L.E. MYERS, U.S. Dept. of Agriculture, Phoenix, Arizona

Objective: To determine significance of physical and chemical processes associated with liquid and vapor-phase movement of water in soil as related to water loss from soil and to develop and test means for reducing such loss.

Plan of Work: Conduct theoretical and experimental studies of water movement through soils and of the physical and chemical status of water in soils. Utilize analog and digital computers to solve one and two dimensional water flow problems related to infiltration and evaporation. Study chemical means of controlling water movement.

SUPPORTED BY U.S. Dept. of Agriculture

2.0034, SUPPRESSION OF EVAPORATION FROM WATER SURFACES

L.E. MYERS, U.S. Dept. of Agriculture, Phoenix, Arizona

Objective: Develop and evaluate principles, methods, and materials for reducing evaporation from water surfaces.

Plan of Work: Conduct laboratory and field studies of chemical films, reflective materials, and mechanical barriers. Measure temperature gradients, radiation, wind velocity and related factors. Calculate energy balances, determine processes involved and effectiveness of treatment. Determine influence of destructive forces, such as weathering and wind damage. Utilize laboratory and field data to develop practical methods for evaporation suppression.

SUPPORTED BY U.S. Dept. of Agriculture

2.0035, FACTORS GOVERNING EVAPOTRANSPIRATION OF WATER FROM CROPPED FIELDS

L.E. MYERS, U.S. Dept. of Agriculture, *Phoenix, Arizona*

Objective: To determine physical processes involved in water transfer from the soil to plant roots through the plant to the atmosphere, and determine the influence of environmental factors on water absorption and transfer through soil-plant-atmosphere systems with the ultimate goal of controlling transpiration for water conservation.

Plan of Work: Transpiration and factors affecting it will be studied in a controlled environment chamber and under natural field conditions. Environment chamber will be used to study absorption and transpiration under different conditions of radiation, temperature and humidity. Evaporation and transpiration under natural conditions will be studied using precision weighing lysimeters, radioactive moisture meters and other pertinent tools.

W equals per foot of the midship section (lbs/ft); L equals length (ft).

SUPPORTED BY U.S. Dept. of Agriculture

2.0036, EVAPOTRANSPIRATION THEORY AND MANAGEMENT

O.E. LEPPANEN, U.S. Dept. of Interior, Water Resources Division, *Phoenix, Arizona*

The objective of this project is to study the physical processes involved in evapotranspiration and to develop techniques and equipment for measuring evapotranspiration.

Existing and suggested designs for thermal spectrum radiometers will be evaluated. New instruments will be designed if considered advisable. Uncomplicated thermal metric methods involving harmonic analysis will be studied in order to determine simplified methods of measuring conducted heat flow to and from soils. Metabolic processes of vegetation will be examined from a thermodynamic point of view to determine the effects of metabolism upon the energy budget of vegetated surfaces. A practical application of the principles of thermodynamics in describing the movement of water in the vapor phase within soils will be studied.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0037, ELECTRICAL ANALOG MODELS OF HYDROLOGIC SYSTEMS

E.P. PATTEN, U.S. Dept. of Interior, Water Resources Division, *Phoenix, Arizona*

This is a continuing activity that is now progressing along two broad fronts: electric modeling of ground and surface-water systems, and hydraulic modeling of idealized ground water flow systems.

The electric analogs are problem oriented projects whose design incorporates the pertinent regional controls of a particular hydrologic environment. Direct simulation of the hydrologic system is achieved through the use of resistor-capacitor networks and operational amplifiers programmed according to a conceptual model of the system.

Hydraulic models are developed according to needs for better understanding of flow and mass-transport phenomena, and for verification of theoretical expressions by hydraulic experiments.

2.0038, SYSTEMATIC AND BIOGEOGRAPHIC STUDIES OF AQUATIC AND SEMI-AQUATIC ORGANISMS IN NORTHERN MEXICO

W.L. MINCKLEY, Arizona State University, Graduate School, *Tempe, Arizona 85281*

Abstract.--Aquatic and semi-aquatic habitats of the basin of Cuatro Ciénegas, central Coahuila, Mexico, comprise one of the most unique biological areas of North America. Geographic position, and a rich, though scarcely studied, endemic fauna of mollusks, crustaceans, fishes, and reptiles, the only groups studied to date, make the basin especially suitable for systematic and biogeographic research. Modifications of some habitats by man

2. WATER CYCLE

have influenced the biota through desiccation of certain areas and by connection of some formerly-disjunct drainage systems through canals. Sampling to continue present studies, expansion of research on the known biota through collection of ecologic and distributional data, new work on certain groups (aquatic plants, mollusks, crustaceans, and insects), securing of materials for laboratory analyses, definition of natural areas for preservation, and plans for publication of results, are outlined. Assurances of local support, cooperation and interest by individuals and agencies in the United States and in Mexico, accessibility, and the availability of local facilities all favor success of such a project.

2.0039, RESPONSE OF CITRUS TREES TO SOIL MOISTURE

R.H. HILGEMAN, Univ. of Arizona, Agricultural Experiment Sta., *Tempe, Arizona*

(1) Determine the effect of soil moisture upon tree growth and condition, fruit yield, size and quality; determine the most economical use of water; study factors associated with different levels of soil moisture which influence tree condition. (2) Determine the effect of moisture stresses in the fall upon fruit production and quality. (3) Determine the amount of water depletion from the root zone which is caused by evaporation and percolation to lower depths.

Description of work: Tensiometers have been used to establish soil moisture differentials. Yield and quality data has been obtained on fruit from trees subjected to different soil moisture tensions. Transpiration and leaf moisture deficit data are being correlated with soil moisture tensions and tree growth and yield, etc.

SUPPORTED BY U.S. Dept. of Agriculture

2.0040, PRECIPITATION PATTERNS ON RANGELAND WATERSHEDS IN THE SOUTHWEST

R.B. HICKOK, U.S. Dept. of Agriculture, *Tucson, Arizona*

Objectives: Improved prediction of precipitation parameters affecting runoff and sediment production.

Plan of Work: Establish precipitation time-depth, areal distribution, storm sequence, and fall-direction expectancy relations to general and local climatic influences.

SUPPORTED BY U.S. Dept. of Agriculture

2.0041, SEDIMENT YIELD FROM RANGELAND WATERSHEDS IN THE SOUTHWEST

R.B. HICKOK, U.S. Dept. of Agriculture, *Tucson, Arizona*

Objective: Develop methods for predicting sediment amounts, types, and delivery characteristics from agricultural watersheds of varying sizes, physiography, land-use and management.

Plan of Work: Establish factors governing amounts and types of sediments produced and their transport. Determine sediment loads in streams and deposited in reservoirs, relating these to rainfall, runoff, topography, geology, soils, land use, and cultural practices. Identify and evaluate production of various types of sediment source areas, and determine and characterize sediment delivery processes to derive improved equations for estimating sediment yields.

SUPPORTED BY U.S. Dept. of Agriculture

2.0042, GILA RIVER PHREATOPHYTE PROJECT

R.C. CULLER, U.S. Dept. of Interior, Water Resources Division, *Tucson, Arizona*

Objectives: 1. To evaluate water salvage by phreatophyte control on a flood plain typical of the areas of existing and proposed application. 2. To describe the hydrologic and ecologic variables for the purpose of extrapolation of observed data to other locations.

Plan of Work: A water budget is being used to measure the evapotranspiration from a 16-mile reach, containing 9,000 acres

2. WATER CYCLE

of phreatophytes, of the Gila River Flood Plain on the San Carlos Indian Reservation, Arizona. This reach has been divided into three subreaches for comparative evaluation. The water budget includes surface inflow and outflow of the Gila River, surface inflow from tributaries to the reach, ground-water movement, precipitation, and change in moisture storage in the saturated and unsaturated soil zones. The energy budget, mass transfer, and phreatophyte well methods of measuring evapotranspiration are being applied and compared to the water budget. All data will be analyzed by digital computer.

The preclearing calibration will cover the period 1963-66. The phreatophytes will be removed and a beneficial vegetation substituted during the winter of 1966-67. The post-clearing calibration will continue through 1969.

The project includes studies of vegetation, chemical quality of water, and sedimentation.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0043, WATER RESOURCES APPRAISAL OF THE TUCSON BASIN, ARIZONA

E.S. DAVIDSON, U.S. Dept. of Interior, Water Resources Division, Tucson, Arizona

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Arizona and the U. S. Bureau of Reclamation.

Purpose - To determine the amount of ground and surface water moving in and out of the Tucson basin including recharge from streams in the area; evaluate the effect of present and proposed pumpage and surface-water flow on ground-water storage; and describe salinity and fluoride occurrence and distribution in ground water and relate to the lithologic variation of the aquifers and to ground-water withdrawal.

Methods - Existing data on ground-water withdrawn, declines in water levels, quality of ground water, aquifer characteristics, surface- water inflow and outflow, precipitation, and basin geometry will be compiled and analyzed. Additional gaging stations will be installed and miscellaneous surface-water measurements will be obtained to define areas of streamflow depletion. Test holes will be drilled to collect water-quality and lithologic information. Water samples will be analyzed to provide additional information on salinity and fluoride distribution. Geophysical studies will be made and will include seismic gravity and aeromagnetic techniques. An electric-analog of the basin will be constructed to predict changes of water levels under various patterns of development.

2.0044, ELECTRICAL-ANALOG ANALYSIS OF HYDROLOGIC DATA, ARVA VALLEY, ARIZ

O. MOOSBURNER, U.S. Dept. of Interior, Water Resources Division, Tucson, Arizona

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Arizona.

Purpose - To provide predictions of future positions of the water table in an area where ground water is being pumped at a much greater rate than the rate of replenishment.

Methods - Intensive ground-water development and data collection in Arva Valley began about 1950. All existing hydrogeologic data (water levels, pumpage, and transmissibility) from Arva Valley and adjoining areas will be used in an attempt to approximate the actual ground-water system by the electrical model. When simulated water level changes from the model correlate with historic waterlevel declines resulting from actual pumping rates, it may reasonably be assumed that the model is analogous to the hydrologic system. The electrical model will then be used to predict future water-level changes.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0045, VEGETATION CHANGES IN SOUTHWESTERN NORTH AMERICA

R.M. TURNER, U.S. Dept. of Interior, Water Resources Division, Tucson, Arizona

Arroyo cutting, springs and rivers that run no more, mesquite invasion of impoverished remnants of former grasslands, death of saguaro and oak forests are all changes of recent occurrence in southwestern North America. Though these changes and others are recognized, their extent is not fully known nor their causes understood. Several studies, most of which are inconclusive, have stressed man's role in causing the changes; little critical attention has been given to the possibility of secular trends in climate as one of the causes. Many of the changes do not favor man's increased use and more intense occupancy of this arid region. Whether the trends, can be halted is not known but, if the changes can be arrested or modified, it is necessary to more fully understand the scope of the changes and to more closely analyse the causes.

The study is divided into three parts: (1) Photographic documentation of the scope and nature of the changes; (2) the intensive examination of soil moisture relations and micrometeorology of vegetation zones known to be most greatly affected by the changes; and (3) the study of the climate and vegetation of the area as a means of defining present conditions and of detecting secular trends in climate that may affect differently the several recognizable subdivisions of the arid region.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0046, FACTORS AFFECTING PRODUCTION OF PECANS IN ARIZONA

R.C. BOWERS, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

DESCRIPTION OF WORK - (1) Soil moisture differentials have been established by setting up different irrigation schedules. Occurrence of stick-tight nuts and yield are being correlated with amount of water being applied. Total soluble salts in soil in various plots has been determined and attempts to reduce same are being made by leaching experiments. (2) Occurrence of zinc deficiency symptoms have been noted for individual trees. Leaf samples have been collected for analysis of various nutrient elements.

SUPPORTED BY U.S. Dept. of Agriculture
Arizona State Government

2.0047, HYDRAULICS OF SURFACE IRRIGATION

C.D. BUSCH, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objective 3: By field trials, to test the validity of mathematical equations and laboratory relationships describing the hydraulic characteristics of surface flow.

The Arizona State Experiment Station will carry on field research for the evaluation of the mathematical flow models developed by other contributing stations. The work will consist of two phases: Phase I: 1964-65, development of the necessary equipment needed to measure and record electronically the advance and recession curves for border and furrow irrigation. Phase II: 1965-69, measurement of the component surface flow variables on a range of sites selected to provide differing soil conditions and stages of crop growth. The data will be evaluated for agreement with and refinement of, the mathematical models. It will be made available to other contributing stations for further evaluations.

Arizona State Government

2.0048, CARBON-14 CONTENT OF FRESH WATER CARBONATES

P.E. DAMON, Univ. of Arizona, Graduate School, Tucson, Arizona 85721

2. WATER CYCLE

The carbon-14 contents of southwestern caliche deposits, lake carbonates and spring tufa deposits are being determined.

The radiocarbon content of lake carbonates is being used to define the extent and duration of pluvial lakes. The work on caliche deposits is helping to elucidate the mechanism of deposition and the relation between calichification and paleoclimatology.

Comparison of the radiocarbon content of organic matter, tufa and water is being used to define the paleohydrology of artesian water systems.

In addition to the paleohydrologic and paleoclimatic implications, this study has helped to define the problem of the initial C14/C12 ratio in fresh water systems. Lack of such knowledge may result in large and even absurd errors in radiocarbon dating.

U.S. National Science Foundation

2.0049, PREDICTION OF WATER MOVEMENT IN UNSATURATED SOILS

D.D. EVANS, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives: (1) To delineate the influence of structural and electrostatic differences as well as solute concentrations and energy gradients upon the movement of solutes, energy, and water in soils. (2) To devise quantitative expressions describing the simultaneous movement of water, solute and energy in soils.

Work Proposed: The flow of water and energy will be examined under conditions of simultaneous water potential and temperature gradients for the purpose of improving the production of flow to evaporative surfaces. Initially, flow will be restricted to one dimensional, steady-rate flow to an evaporative soil surface when the water potential and temperature are held constant at the surface opposite the evaporative surface. Water potential and temperature gradients, quantity of flow and appropriate soil properties will be measured and the data used to evaluate different equations developed for predicting flow under those conditions.

Individual clay particles will be suspended in an electric field enclosed in controlled environments to study rates and amounts of water adsorption or desorption with changes in the vapor pressure of the environment. The rates of absorption are expected to lead to a better understanding of the kinetics of water adsorption. The amounts of adsorption by individual particles at a specific vapor pressure will be compared to the amount of adsorption by similar particles in a packing at the same vapor pressure.

2.0050, SOIL PHYSICAL CHANGES DUE TO MANAGEMENT PRACTICES

D.D. EVANS, Univ. of Arizona, School of Agriculture, Tucson, Arizona 85721

The objectives of the project are (1) to evaluate soil physical changes due to different management practices and (2) to relate encountered changes to water management, tillage practices and crop yield. The soil physical changes which have occurred due to different management practices in certain long-term experiments established at several locations in Arizona will be assessed by selected measurements. It is anticipated that a study of methods will be the initial work done on the project. After an evaluation of methods, field and laboratory measurements will be made on the soil for various practices and the results related to water management, tillage practices, and crop yields.

SUPPORTED BY Arizona State Government

2.0051, HYDROLOGIC CHARACTERIZATION OF FORESTED WATERSHEDS IN ARIZONA

H.C. FRITTS, Univ. of Arizona, Water Resources Research Ctr., Tucson, Arizona 85721

The purpose of the proposed study is to better describe and predict with emphasis on probabilities streamflow runoff from forested watersheds in Arizona. In addition, hydrologic potentials

within forest types in terms of snowpack dynamics will be predicted and management guidelines for increasing snowmelt runoff will be developed.

Streamflow characteristics will be described by electrical analogy including precipitation, interception, infiltration and stream routing components. Hydrologic data for statistical studies will be augmented by dendrochronological techniques that allow objective translations of tree ring records into stationary time series. Models for the relation between tree ring widths and runoff will be developed. Within the framework of fundamental hydrologic principles, snowpack dynamics will be related to biotic, topographic, edaphic and climatic parameters by regression analyses. These analyses will provide a system for predicting snowpack water yield potentials and identifying optimum management goals.

2.0053, DIFFERENTIAL ION MOBILITY AT COLLOIDAL SURFACES

R.J. HANNAPEL, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

The objectives of this project are: 1) To assess the mobility of alkali cations at solid phase surfaces in reference to the mobilities in bulk solution 2) To relate surface structural variation to differential ionic mobility 3) To evaluate the effect of hydrophobic bonding and the corresponding quasi-crystalline structure of water at solid-aqueous phase interfaces upon ionic mobility and the resulting selectivity in ion transport in multion systems 4) To develop a working model which can be applied to surface migration in soil and plant colloids.

Procedure: By using diffusion potential measurements along with simultaneous ion flux measurements (using sensitive radiotracer techniques), ionic mobility in synthetic membrane systems will be measured. The membrane system proposed for use allows the desired manipulations in its surface properties so that the stated objectives can be studied.

2.0054, STRUCTURAL CONTROL OF SPRINGS FROM THE MUAV AQUIFER IN WESTERN GRAND CANYON NATIONAL PARK, ARIZONA

P. HUNTOON, Univ. of Arizona, Graduate School, Tucson, Arizona 85721

Perennial springs, some with flows exceeding 50 cubic feet per second, discharge from the Muav limestone aquifer in the Western section of the Grand Canyon National Park. These springs are apparently the discharge points of the limestone aquifers in the western sector of the Kaibab Plateau. It is the purpose of this study to determine if these discharge points are controlled by the tectonic fabric of the region.

2. WATER CYCLE

Prominent faults in the Grand Canyon will be mapped and traced into the Kaibab Plateau. The springs and cavern entrances in the Redwall and Muav limestones will be mapped to determine if there is any correlation with local tectonic structures. It will be determined if the altitudes of springs are structurally controlled. The physiographic trends on the Kaibab Plateau that suggest structurally controlled recharge to the regional aquifers will be characterized. The probable magnitude of underground drainage system will be calculated from available spring discharge and rainfall data.

2.0055, WATER USE EFFICIENCY OF FORAGE CROPS
W.R. KNEEBONE, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

OBJECTIVES: To measure variability within species for the characteristics 'efficient water use' in order to best develop a breeding procedure for changing a species and developing an improved variety. To develop techniques for evaluating efficiency of water use by forage crops.

WORK PROPOSED: Variation within species of several forage crops for water use efficiency will be measured. Less than optimum water for maximum forage production will be applied in order to separate genotypes for their ability to produce forage under these limited moisture conditions. Mature plants will be measured for total forage production, recovery after harvest and survival.

The work now in progress concerned with evaluating survival and forage production of a large number of grass and legume species will be continued.

2.0056, RADIOCARBON AS A TRACER IN GROUND WATER PROBLEMS
A. LONG, Univ. of Arizona, Graduate School, Tucson, Arizona 85721

The radiocarbon content of ground and surface waters is being used as a tracer to study surface and ground water movement. The data are being related to such ground water problems as the rate of laminar flow through aquifers, their permeability, the source, time and rate of charge, radioactive contamination in water supplies, and the waste disposal problem.

The increase in the carbon-14 content of the atmosphere, biosphere and hydrosphere due to nuclear technology is also being monitored.

SUPPORTED BY Arizona State Government

2.0057, WATER CONSERVATION THROUGH EFFICIENT USE BY CROP PLANTS
M.A. MASSENGALE, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

OBJECTIVES: 1. To determine why genotypes within a species differ in their water use. 2. To determine if plant factors found to be associated with water-use efficiency are heritable. 3. To develop efficient plant-water management systems and improved varieties for greater water-use efficiency.

Plan of Work: Genotypes within a species that differ in their water use will be grown under a range of moisture-stressed conditions in controlled-environmental growth facilities. Physiological and morphological factors which may affect or be related to water-use efficiency will be studied and evaluated. Any unique biochemical, physiological or morphological feature found to be associated with water use will be investigated in detail.

Field work will be initially concerned with determining the best time to apply water, when in short supply, for maximum efficiency per unit of dry matter produced. Later, field studies will be concerned with the development of management systems and improved varieties that favor characters found to be associated with efficient water use.

2.0058, GROUNDWATER SUPPLIES
W.G. MATLOCK, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

This is a continuing program of groundwater investigations in the Santa Cruz and Avra-Alter Valley in Pima and Santa Cruz County and in the Little Chino Valley in Yavapai County.

The program includes annual water level measurements in wells, preparation of groundwater level contour maps and depth to water maps, and the collection of well log information. Crop surveys are made to compute irrigation water use and other water uses are tabulated. Special studies are made of volumetric unwatering, natural recharge and quality of water. Well tests are conducted to determine aquifer characteristics.

Data collection started in 1940 and will be continued

2.0059, WATER-SOIL-PLANT RELATIONS
K. MATSUDA, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objective II - Evaluate effect of plant structures, physiological processes and transpiration retardants on water movement and loss from plants. (a) Determine relative resistance offered by different tissues in the root to radial movement of water and salts. (b) Determine resistance offered by the suberin layer on the outer surface of suberized roots to entry of water and salts. (c) Determine the 'leakiness' of roots, or the inability of roots to maintain high concentrations of salts in the stele, for different stages of development and different species. (d) Determine effects of temperature, osmotic potential, and mineral composition of ambient medium on salt accumulation and water absorption by roots. (e) Attempt to correlate root structure and salt and water absorption, particularly active absorption of water.

Work Proposed: Microsurgical techniques will be used to remove layers of tissue from roots. Solutions will be pulled or pushed through treated and untreated roots. External factors, including osmotic potential of medium, will be varied in otherwise constant environment. Anatomical features will be determined by standard histological methods.

2.0060, THE EFFECT OF EVAPORATION BARRIERS ON FISH GROWTH AND LIMNOLOGY
W.J. MCCONNELL, Univ. of Arizona, Arizona Coop. Fishery Unit, Tucson, Arizona 85721

Information is needed on the possible effects on fish and their environment of floating plastic evaporation barriers. Such barriers appear to be more effective and cheaper than mono-molecular films but they reduce light and possibly atmospheric contact by pond water. Measurements of fish growth, aquatic photosynthesis and oxygen levels are being made in a series of experimental ponds having different degrees of coverage.

2.0061, PHYSIOLOGICAL CHANGES IN PLANTS PRODUCED BY SALINE SOLUTIONS
J.W. OLEARY, Univ. of Arizona, Water Resources Research Ctr., Tucson, Arizona 85721

Plants irrigated with brackish water generally have decreased growth and yields. In previous work at this laboratory the physiological response of red kidney beans (*Phaseolus vulgaris* L.) was studied in detail. The results of these studies indicated that irrigation with water containing moderate levels of sodium chloride affects the water metabolism of the plant. The resistance

2. WATER CYCLE

to water movement through the plant increased and the water potential gradient decreased. Partial stomatal closure was observed, and there was a significant decrease in the total leaf area of the plants. Both of these factors tended to decrease transpiration and photosynthesis. Recent observations have shown that by growing the plants in a high humidity environment the water lost from the leaves via transpiration can be decreased. This reduction in transpiration tends to bring about a closer balance between the water lost and the water supplied to the leaves. Thus the water stress in the plant is partially relieved, and growth inhibition is decreased. The large air inflated plastic greenhouses developed at our laboratory may make brackish water irrigation feasible on a large scale. The greenhouses are totally closed to the natural environment. Water vapor added to the air by evapotranspiration remains within the greenhouse and the plants are surrounded by a high humidity environment. Under these conditions growth inhibition by brackish water should be greatly reduced.

2.0062, GEOPHYSICAL INVESTIGATIONS IN ALLUVIAL BASINS IN SOUTHERN ARIZONA

J.S. SUMNER, Univ. of Arizona, Water Resources Research Ctr., Tucson, Arizona 85721

The proposed investigation is directed toward the synthesis of geophysical data in the Tucson Basin area and adjoining basins in southern Arizona and the geological and geohydrological interpretation of this information. Gravity coverage will be completed with a station interval of about one reading per square mile.

Refraction seismic profiles will be run over areas of indicated interest, such as edges of pediments, productive water wells, and gravity anomalies.

Surface resistivity surveys and magnetometer traverses will also be tried in some localities. Surface and well samples will be collected and measured in the laboratory for their density, porosity, magnetic susceptibility, and resistivity.

2.0063, TREATING AN INADEQUACY OF THE UNIT HYDROGRAPH HYPOTHESIS BY STORAGE ROUTING WITH VARIABLE EMPIRICAL VALUES OF LAG AND STORAGE

J.H. THOMAS, Univ. of Arizona, Graduate School, Tucson, Arizona 85721

The outflow hydrograph as predicted by the Sherman unit hydrograph frequently does not agree with the observed outflow hydrograph. It is believed that this lack of agreement is due to the basic hypothesis that each ordinate of the outflow hydrograph is directly proportional to the surface runoff.

Dooze has treated this inadequacy by assuming synthetic partial hydrographs and routing them through various reservoirs throughout the basin. Nash has assumed an instantaneous hydrograph and shaped it according to a gamma distribution by routing it through a series of reservoirs at the outflow point.

It is proposed that results comparable to those of Dooze and Nash could be achieved by assuming a unit hydrograph in the shape of an isosceles triangle with its base equal to the duration of rainfall excess and, by routing it with variable values of storage and lag (using the Kohler Template), reproduce the observed outflow hydrograph. The values of storage and lag would be empirically determined. This method is less complex than those of Dooze and Nash and more amenable to programming in a small computer.

It is further proposed that the method outlined above be tested on a small plot under controlled conditions. The Department of Water Resources at the University has such a plot. It is an area of 1/2 acre, is surfaced with two inches of pea-size gravel over impermeable plastic; has an outflow through a weir with a stage recorder, and has a supply of water available in a 100,000 gallon tank. The additional equipment necessary to this proposed study would consist of plastic pipe, pumps and nozzles. It is understood that such equipment, except for small hardware such as nozzles, is available on the campus.

Rainfall of various intensities and durations would be simulated by spraying the plot from water in the tank. The simulation need not be rigidly controlled although it would be necessary to ensure that the areal distribution be consistent. The runoff hydrographs would be analyzed and an attempt would be made to reproduce these observed hydrographs by the method outlined above. For this analysis, the Kohler Template would be formulated and tested on all of the simulated events. The testing would be done by digital computer.

SUPPORTED BY University of Arizona

2.0064, SNOW HYDROLOGY

D.B. THORUD, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives: (1) To characterize snow accumulation under forest canopies and in natural and man-made openings in ponderosa pine and mixed conifer zones of Arizona. (2) To evaluate the energy supply available for snowmelt, evaporation and sublimation for the forest conditions described under objective one. (3) To relate the results of snow accumulation and energy budget studies to forest management practices that can be prescribed for purposes of improving snow water yield. (4) To develop and modify these studies in a form that will permit snow to be an element in a mathematical model for predicting total watershed behavior.

Description: Snow accumulation will be evaluated by measurements of total water content, density, depth and the spacial variation of these factors. The energy flow to the snowpack will be evaluated with pyranometers, net radiometers and measurements of air temperature and wind for determining heat flow from the overlying air. Vegetation conditions will be evaluated by standard and possibly specialized mensuration techniques. The relationship between vegetation and the water and energy budgets will then be determined. The results of these studies will be developed and modified for a mathematical model of watershed behavior.

2.0065, THE MANAGEMENT OF PONDEROSA PINE - NEW METHODS OF THINNING DENSE STAGNATING SECOND GROWTH STANDS

R.F. WAGLE, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

I. A. Field Study. A one-hundred acre area in an old burn that has been newly planted to ponderosa pine will be studied intensively in an attempt to isolate the environmental phenomena that are limiting to the germination, survival, and growth of the developing seedlings. The phenomena to be studied will include: a. Soil nutrition, b. Soil moisture, c. Soil and air temperatures, d. Variations in soil characteristics, e. Relative humidity, f. Effect of other plants. B. Laboratory Studies. Reciprocal studies will be made in the greenhouse and in a controlled environment chamber to supplement and aid in the interpretation of the field results. Ponderosa pine seedlings will be grown in the greenhouse in surface soils obtained from three different situations: a. An old burn, b. A new burn, c. An area in which no burning has occurred in known history.

II. A study of the role of the different environmental factors in an attempt to find out how to manipulate the density of second growth stands to get good growth. As a part of this study, the role played by nutrients, stand density, soil water, and atmospheric water in the growth of ponderosa pine is being considered.

Nutrient & water and thinning treatments have been made on a number of different plots & under a variety of situations.

Data is being systematically collected at yearly intervals. One interim study has recently been completed and will be ready for analysis, writing, and publication within the next 6 months.

During the coming year growth records and neutron probe soil water data will be collected on plots involving about 1,500 trees. Some measurements will be taken weekly and others will be taken at the beginning and end of the growing season.

2. WATER CYCLE

SUPPORTED BY University of Arizona

2.0056, HYDROLOGY OF LOWER COLORADO RIVER BASIN

C.C. MCDONALD, U.S. Dept. of Interior, Water Resources Division, Yuma, Arizona 85364

The objective is to obtain knowledge of the hydrology to provide a realistic basis for managing the water resources. The work includes estimating the amount and quality of ground water that may be obtained to supplement river water; investigating the regional movement of ground water between the Colorado River and Imperial Valley, the movement of ground water into the Salton Sea, from Yuma Mesa to adjacent areas, and across the boundary between the United States and Mexico.

Water losses by evapotranspiration will be studied including the experimental determination of water use of several species of vegetation. Evaporation from Lake Mohave, Lake Havasu, and Salton Sea will be measured, and salt-balance determinations will be made in selected areas.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0067, LEMON PRODUCTION IMPROVEMENT

D.R. RODNEY, Univ. of Arizona, Agricultural Experiment Sta., Yuma, Arizona

DESCRIPTION OF WORK. (1) Irrigation experiments involving sprinkler, furrow and flood basin types of irrigation have been established on young trees in cooperation with Dept. of Agric. Engineering. (2) Nitrogen-phosphate-manure differentials have been applied annually to lemon trees. Yield and fruit quality factors have been correlated. Leaf samples have been and are being collected for analysis for nutrient elements. Soil samples have been taken and analyzed for movement of phosphate. (3) Five different methods of pruning have been established on young trees. Yield data is being obtained.

2.0068, THE DISTRIBUTION OF TRACE ELEMENTS IN IMPOUNDMENTS

J.F. NIX, Ouachita Baptist University, Ark. Water Resources Res. Ctr., Arkadelphia, Arkansas 71924

The distribution of trace elements and common water quality parameters will be determined in two impoundments on the Ouachita River in south-central Arkansas. The sampling sites will be chosen in an effort to present a representative picture of each reservoir. The state of occurrence (solution, particulate, organically bound) of each trace element will be investigated using membrane filters and high speed centrifuging.

Samples will be taken during each season and at different reservoir conditions in an attempt to determine the factors which influence the distribution of these elements in the reservoir.

A section of the Ouachita River below these impoundments will be studied to determine if trace elements are being transported from the reservoir. In the event that they are released from the reservoir during power generation, the fate (precipitation, absorption, etc.) of each of the trace elements will be investigated.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
Ouachita Baptist University

2.0069, ENGINEERING PHASES OF IRRIGATION IN ARKANSAS

B.B. BRYAN, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Determine rates at which water may be applied to various soils on which crops are growing; evaluate and develop devices used to determine when to irrigate; determine irrigation efficiency in terms of quantitative measurements of water distribution, losses and application; evaluate systems of irrigation with respect to labor requirements, topographic conditions, power and equipment requirements, and efficient water use; determine mechanics involved in controlling air temperatures with sprinkler irrigation systems.

DESCRIPTION OF WORK - Designed Bench leveling plan and, during construction, collected data on tractor and man hour, fuel, oil and repair requirements at Cotton Bra. Exp. Sta.; conducted length of run and furrow irrigation efficiency studies at Cotton S. W. Bra. Exp. Sta. and Main Exp. Sta.; collected Evapotranspiration and climatological data for various nitrogen levels of cotton at Delta Sub-Station. Designed and graded 3 benches to various slopes for furrow irrigation studies at N.E. Bra. Exp. Sta.

Tests for reduction of temperature by irrigation were run on Veg. Substation on various truck and field crops. On the Main Station, tests were run on an elliptical-shape pipe model with hooded inlet for slopes from 0 to 40 degrees; and manuscript was redrafted on a moisture measuring device using agar and a strain gage; a field was smoothed in preparation of work on a now furrow irrigation study at Southwest Station.

Arkansas State Government

2.0070, MICROMETEOROLOGY OF SOYBEANS

C.E. CAVINESS, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Objectives: 1. Determine the effects of furrow irrigation on the micrometeorology within and above the soybean canopy. 2. Study the effects of micrometeorological factors on rate or type of insect damage and disease infestations with emphasis on the pathogenic organisms. 3. Study the effects of micrometeorological factors on some agronomic characters such as yield, flower shedding, pod set, shattering, seed quality, fertility responses, and others. 4. Measure evapotranspiration at the 0- to 10-inch depth in both irrigated and non-irrigated plots.

Description of work proposed: Studies in the initial stages will, of necessity, be of a general nature because information is limited on which of the micrometeorological factors may be of major importance in disease infestations, insect outbreaks, growth and development of the soybean plant, etc. Then, the second phase will consist of a more critical evaluation of particular micrometeorological factors which appear to affect specific plant responses. Initially, all instrumentation will be accomplished at the Northeast Branch Experiment Station at Keiser under the supervision of a U. S. Weather Bureau agricultural climatologist who is stationed at that location. Personnel from the Agricultural Engineering, Entomology, Plant Pathology, and Agronomy Departments of the University of Arkansas will cooperate in these studies.

Arkansas State Government

2.0072, PHYSIOLOGICAL FACTORS IN WATER NEEDS AND USE OF CROPS

A.A. KATTAN, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

(1) Study methods of determining soil moisture in an attempt to find or develop reliable and efficient technique for-use-in these studies and for grower use. (2) Determine range of available soil

2. WATER CYCLE

moisture that permits optimum growth and fruiting of plants and whether this range varies for different stages of plant development. (3) Determine relationship between nutrient use and moisture ranges for horticultural crops. (4) Study relationship between temperature, optimum soil moisture range and frequency of water application.

DESCRIPTION OF WORK: This work is designed to determine factors which result in maximum yield returns from irrigation and the effect of such practices on growth, minimum yield returns from irrigation and the effect of such practices on growth, mineral uptake yield, and quality of raw and processed products. Four crops have been included in this program: tomatoes, in relation to spacing; sweet potatoes, with recognition of hill spacing and water injury exhibited by this crop; beans, in regard to sensitivity at various stages of development; and peaches, in respect to both intensity of fruit load and stage of fruit development. The following determinations are made: changes in soil moisture; leaf mineral analyses with respect to gradients between young and old tissues; yield and grade; physical and chemical analyses of quality of raw and processed product, and post-harvest changes during storage.

SUPPORTED BY U.S. Dept. of Agriculture
Arkansas State Government

2.0073, MANAGEMENT ALTERNATIVES ON OZARK FOREST

F.M. MEADE, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Objectives: 1. To determine the Physical inputs and outputs, costs and return from forest production of low-grade hardwood areas under different levels of management including conversion to pine. 2. To measure physical inputs and outputs, costs and returns, from forage production on low grade hardwood areas converted to range-land at different levels of management. 3. To determine the siltation, water infiltration and runoff under a forest cover compared with range cover. 4. To compare the economic returns from low-grade hardwood areas managed for forestry purposes with similar areas managed for range grazing.

Description of Work Proposed: The two major soil types of the Ozark uplands, limestone chart and Boston Mtn. Sandstone, supporting forest cover will be sampled by using forestry and range development techniques. Forestry practices appropriate to the Ozark upland hardwood stands will be evaluated and compared with conversion to pine. As an alternative to Forestry, rangeland development studies will be initiated on adjacent and using natural vegetation, seeded, and fertilized as the base treatments. Plant succession studies will be carried on under all treatments, on both soil types. Sedimentation as a measure of erosion will be measured in relation to rainfall and runoff on small watersheds in treatment areas. Economic relationships will be evaluated from all treatments.

SUPPORTED BY U.S. Dept. of Agriculture
Arkansas State Government

2.0074, A STUDY OF THE PHYSIOLOGIC AND CULTURAL FACTORS WHICH INFLUENCE PRODUCTION OF TREE FRUITS

R. ROM, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Objectives: 1) To study the nutrition of fruit trees using foliar analysis as the diagnostic technique. 2) To investigate the use of chemicals which may affect the physiology of the tree, 3) To study the response to irrigation with reference to need, timing, and amount. 4) To study tree training and pruning with emphasis on bulk methods and adaptation to mechanization. 5) To study cultural methods relating to fertilizer, cultivation and cover crops. 6) To investigate the interactive effects of the above mentioned objectives.

Procedures: Fruit trees to be used in these studies are already found in experiment station plantings; new blocks will be set to meet specific experiments; outlying orchards will be used when necessary.

Repeated tissue sampling of commercial orchards will be made to relate nutrition balance and intensity with production

and quality. Specific experiments will be designed to study fertilizer programs required to maintain production. Chemicals and growth regulators to be used to modify plant physiology to make them more adaptable to Arkansas conditions.

Studies on the effects of irrigation on production and quality to be made on basis of short drought, extended drought, and continuous production. Bulk pruning to be simulated for purpose of studying tree response to this management.

SUPPORTED BY Arkansas State Government

2.0075, IRRIGATION INVESTIGATIONS WITH AGRONOMIC CROPS

L. THOMPSON, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Evaluate methods of determining critical soil moisture levels for irrigation; determine optimum rate and grade of fertilizer and optimum time and method of application for agronomic crops grown under irrigation; evaluate yield responses of certain selected agronomic crops when irrigation is carried out by sprinkler and furrow methods; determine effect of plant population, planting dates and other cultural management practices on degree of response to supplemental irrigation; evaluate effect of land leveling operations required for furrow irrigation upon soil fertility and resultant yield; study methods of increasing infiltration rate of irrigation water into soil in which the rate is slow.

DESCRIPTION OF WORK: Since 1950, irrigation-fertility experiments have been carried out at four locations. The effect of irrigation and levels of nitrogen upon the yield of three cotton varieties was measured on the Richland silt loam soil at Marianna, the Sharkey clay and the Dundee silt loam at Clarkdale. The effect of land and fertilization of the Richland silt loam for irrigation upon the yield of corn was also measured at Marianna. At Stuttgart, the combined effects of irrigation, fertilization, and deep plowing, upon soybean yields were measured. Various sources and rates of nitrogen have been used in irrigation experiments on corn, grain sorghum, and Tracy sorghum at Fayetteville. In addition, one greenhouse experiment on the causes of so called crazy cotton has been completed. Help has been given on the multiple-factors cotton experiment at the Southeast Branch Station.

2.0076, SEARCH FOR AND IMPORTATION OF FOREIGN INSECT ENEMIES OF WEEDS

L.A. ANDRES, U.S. Dept. of Agriculture, Albany, California

Object: To investigate the natural insect enemies of weeds in foreign countries and to collect and ship to the United States those species which will feed on or otherwise injure weeds.

Plan of work: Research will proceed through the following stages: (1) searching of the literature to establish the world distribution of particular weeds and the insects or other enemies known to feed on or otherwise injure them; (2) visits to areas where weeds originated and searches for predatory insects; (3) obtaining information concerning the interrelationships between a weed and other plants and animals, and the effects of soil and climate on such interrelationships; (4) screening tests to insure that weed control insects are not harmful to useful plants (The ecological studies and taxonomic information regarding related plants will serve as a guide for screening tests.); and (5) shipment of promising insect species to appropriate quarantine receiving stations in the United States.

SUPPORTED BY U.S. Dept. of Agriculture

2.0077, HYDROLOGIC ANALYSIS METHODS

H.W. ANDERSON, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Berkeley, California

Object: To develop, test, and illustrate improved methods of analysis in forest hydrology.

Plan of work: The development and evaluation of variables which influence water yield, floods, and sedimentation will be studied. (A) One aspect of the work is the evaluation of variation of

2. WATER CYCLE

water yield in relation to watershed and meteorological variables such as topography, elevation, geology, precipitation, and the evaporation potential. (B) Past records of floods from many watersheds, measured under a variety of changing land use and vegetation, will be analyzed to determine fundamental relationships between land use and floods. (C) Current work on suspended sediment discharge will be extended to include deposition in reservoirs and the relationships between watershed characteristics, suspended sediment discharge, and reservoir deposition. (D) Basic to all watershed evaluations are more accurate measures of the supply factors of precipitation, snow accumulation and snow melt. The relationship of these supply factors to large scale and small scale terrain and forest conditions will be studied.

SUPPORTED BY U.S. Dept. of Agriculture

2.0078, FLOOD AND SEDIMENT REDUCTION IN THE CONIFEROUS TIMBER ZONE OF CALIFORNIA **R.R. ZIMER**, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Berkeley, California

Object: To develop management methods that will minimize local floods, erosion and sedimentation, maintain water quality, and improve timing of streamflow; and to develop methods for predicting the effects of forest and land management practices upon sedimentation and streamflow.

Plan of work: Studies of gravitational mass movement will continue; resurveys of inclinometer holes will determine rate and location of surface and subsurface creep; and aerial photo comparisons will point out causes of landslides. The project staff will continue to study the effects of logging on streamflow, sedimentation, and fish habitat, and current studies will relate soil moisture to logging effects and to moisture storage opportunities for flood abatement.

SUPPORTED BY U.S. Dept. of Agriculture

2.0079, SHALES AS FILTERS IN NATURAL WATERS **F.A. BERRY**, Univ. of California, Graduate School, Berkeley, California 94720

This proposal is concerned with investigating the relative filtration effects of shales upon the various ionic and molecular constituents of naturally-occurring formational waters. The principal mode of investigation will be to investigate the problem theoretically and to examine chemically the waters from geologic sites that are known to be either effluent or hyperfiltrated waters with respect to natural shale membranes. Dehydration reactions are the principal contributors to the effluent waters in some localities. Experimental laboratory studies will also be undertaken as a secondary mode of investigation.

The field areas of investigation include the Gulf Coast, U.S.; the Indus Plains of West Pakistan; the Po Valley, Italy; sedimentary basins on the north side of the Alps; the Golfo San Jorge basin in Argentina, and others.

SUPPORTED BY U.S. National Science Foundation

2.0080, PROPERTIES OF SOILS RELATED TO APPLIED STRESSES **P.R. DAY**, Univ. of California, Agricultural Experiment Sta., Berkeley, California 94720

Determine the influence of various factors upon deformation, including: (a) particle size; (b) initial state and composition, including additives; (c) amount of water and magnitude of soil moisture tension; and (d) direction of water content change at time of stress. The changes and effects produced by compaction and the processes of recovery will also be examined, as progress permits.

Description of work --Work will first be directed primarily at (a) and (c) above. Compacted bulk density will be measured in relation to water content of silty clay-sand mixtures, which will be treated as binary mixtures. These will constitute a texture series of seven members. They will be compacted with a mechanized 'kneading' compactor set to deliver a maximum pressure of 20 lbs/sq. in./stroke while retained in a rigid-walled vessel with a

porous bottom to allow measurement of tension-water content relationships. This will be done for maximum and minimum bulk densities for each texture and the pore size distribution function determined. Measurements will be repeated with the same materials after polymer treatment. Other properties and responses of the compacted specimens will also be examined in an attempt to understand the reversibility of structural alteration. Related work will be done with clay-polymer complexes in an endeavor to elucidate the structure modification. This will continue past use of a Maron-Krieger-Sisko viscosimeter and an RCA-EMU-2 electron microscope.

California State Government

2.0081, STUDY OF TRANSPORT, DEPOSITION AND SCOUR OF FINE PARTICLES THROUGH A POROUS MEDIUM

H.A. EINSTEIN, Univ. of California, School of Engineering, Berkeley, California 94720

The results obtained so far in this investigation are for idealized porous media of unisize, spherical balls arranged in a rectangular pattern. However, consecutive layers of spheres are displaced in such a way as to produce critical minimum openings equal to those in the hexagonal pattern. In nature, the soil mass is neither homogeneous nor isotropic. In order to apply the results to the field condition, it is necessary to extend this investigation to a heterogeneous porous medium.

The objective of this investigation is to use porous media with different particle size distributions, the pore openings of which can be expressed statistically. The clogging and non-clogging of this heterogeneous medium is to be examined with unisize moving particles. The result of this study would then lead to a prediction of the behavior of various moving particles through a heterogeneous porous medium.

SUPPORTED BY U.S. National Science Foundation

2.0082, RHEOLOGY OF SOIL-WATER SYSTEMS

L.J. WALDRON, Univ. of California, Agricultural Experiment Sta., Berkeley, California 94720

The objectives of the proposed project are to obtain measurements of (a) the strain response of soil to static and sinusoidally oscillating stress and (b) the effect of water content and soil-water suction on these mechanical responses. This data will be used to evaluate stress-strain theories, especially those that express the time-dependence of stress-strain ratios, for example, viscoelasticity.

Dynamic and static shear strain measurements are to be made over a wide range of soil consistence. Water contents are to vary from monomolecularly adsorbed water to near saturation. In general, stress and strain amplitudes will be small so that where linear viscoelastic response is found its upper limit may be defined in terms of stress, strain, strain-rate, water content and soil water potential.

2.0083, INDUCTIVE ELECTROMAGNETIC METHODS FOR MAPPING AND EVALUATING AQUIFERS

S.H. WARD, Univ. of California, School of Engineering, Berkeley, California 94720

We propose to investigate the theoretical basis for inductive systems of measuring apparent electrical conductivity and apparent dielectric constant, to design and construct a novel 'tilt angle' electromagnetic depth sounding system, and to make a field application of the system to geologically well-documented test areas in California.

Complete catalogues of interpretation curves are necessary for use of inductive systems and these would be obtained by use of a high-speed digital computer and peripheral equipment prior to equipment development.

The development of economical and reliable electrical sounding techniques, especially suited for use in groundwater problems arising in arid and semi-arid regions, is the primary objective of the proposed research.

2. WATER CYCLE

University of California

2.0084, GENERALIZED ANALYSIS OF SMALL WATERSHED RESPONSES

J. AMOROCHO, Univ. of California, School of Engineering,
Davis, California 95616

The objectives of the investigation are to develop generalized procedures for the establishment of the relationships between inflow and outflow in natural watersheds, with full recognition of their nonlinearity and parameter distribution characteristics. These relationships will be used in the reconstruction and prediction of hydrologic events.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of California

2.0085, GENERALIZED ANALYSIS OF SMALL WATERSHED RESPONSES

J. AMOROCHO, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

(a) To expand the theory of functional series representation to the description of non-linear physical systems with particular emphasis on hydrologic systems; and (b) to investigate the application of these nonlinear methods of analysis to the evaluation of the responses of watersheds under the action of ruin.

The work will be conducted in the theoretical area by development of the necessary mathematical procedures of analysis; and in the experim field by laboratory experiments on small catchments and by analysis of small natural watersheds.

2.0086, MIXING PROCESSES IN SATURATED AND UNSATURATED SOIL-WATER SYSTEMS IN RELATION TO POLLUTION

J.W. BIGGAR, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: Analyze the transient nature of the mixing of dissolved organic and inorganic ions in water flowing through saturated and unsaturated soils. Impose the presence of thermal gradients and analyze the transient nature of the mixing of two fluids at two different temperatures for similar and dissimilar salt concentrations. Ascertain the nature of the porous material by comparison of mixing of thermally different solutions with chemically dissimilar solutions.

Description of Work Proposed: Attempt to describe the systems by means of thermodynamic and hydrodynamic models with the aid of computer analysis. Particular attention will be given to the physical properties of the fluids used. This project will augment previous and present work conducted under Regional Projects W-68 and W-82. Experimental laboratory work to test theory and provide ranges of values for parameters will be obtained.

2.0087, LIMNOLOGY OF ROSS ISLAND, ANTARCTICA

C.R. GOLDMAN, Univ. of California, Graduate School, Davis, California 95616

This proposal requests support for the preparation of a report of data collected at Cape Evans, Antarctica. The work would be carried out at the Institute of Ecology, University of California, Davis.

Field studies conducted in Antarctica during the austral field season of 1961-62, 1962-63 by the principal investigator with the assistance of D. T. Mason, B.J.B. Wood and J.E. Hobbie have been reported in a series of short scientific papers; two of these papers were on dry valley lakes. Much of the research data based on a systematic multidimensional analysis of the Cape Evans lakes remains to be published. This includes weekly sampling of water chemistry, primary production of plankton and benthos as well as plankton and benthos composition, both taxonomic and chemical, energy budget measures and local weather information. While some of those data are reported, teaching, other research

commitments and transfer of personnel forced suspension of the work. The proposal allows Mason to work at Davis for three months on a leave of absence from Washington State College during the winter quarter of 1968. This contribution to Antarctic limnology will be submitted for publication in the Antarctic Research Series.

No field work this season.

2.0088, WATER-SOIL-PLANT RELATIONS

R.M. HAGAN, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: 1. Investigate relationships between water stress in root medium and internal water status of plants as affected by environment and plant development. 2. Evaluate effect of plant structures and transpiration retardants on water movement and loss from plants. 3. Determine effects of plant water stress and nutrients on morphology and metabolic processes determining growth and composition of plants.

Procedures: Investigations will be directed toward evaluating fundamental relations between water and plant growth. It will be necessary to evaluate these water-plant relationships under various conditions of environment and stage of plant development. To the extent that facilities permit, these studies will be conducted in controlled environment chambers, using modern techniques for soil moisture and environmental control and measurements.

California State Government

2.0089, WATER AND SOIL TEMPERATURE IN RELATION TO PLANT GROWTH

R.M. HAGAN, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

(1) To correlate the temperature of water in the Feather River with water temperature in the irrigation distribution system in the Feather River Service Area; (2) To evaluate the behavior and yield of important crops irrigated with water at low temperatures under controlled conditions; (3) To correlate field indicators of crop response to low temperature water with behavior of plants under controlled conditions.

The gradients of water temperature from the Feather River above the Oroville Dam site to the growers' turnouts in the Feather River Service Area will be made with thermographs between 1962 - 1964, three years before construction. A continuation of the field measurement program from 1964 through 1971 is envisaged as a future objective to cover temperature changes during and after construction of the Dam. These data will document the effect of construction on irrigation water temperature. They will be gathered by the State Department of Water Resources in cooperation with the Department of Irrigation. The University's research staff will correlate these field temperatures with agronomic and physiologic responses of important crops near temperature measurement sites as well as cross-correlate field responses of crops with the effects of irrigation water temperatures under controlled conditions.

2.0090, IRRIGATION MANAGEMENT FOR CROPS

D.W. HENDERSON, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Study moisture content and other soil characteristics relative to compaction and infiltration. Study causes of slow water penetration other than compaction and Na. Determine effect of amendments on structure and infiltration. Study root development in impervious soils and relation of root development and root diseases to available water. Evaluate crop systems and management affecting water supply to future crops. Evaluate from water supply viewpoint crop responses to tillage methods. Develop criteria for land grading, irrigation water management, and drainage of slowly permeable soils. Study accumulation of salts relative to water penetration rates.

2. WATER CYCLE

Description of Work: Root development and moisture extraction patterns of deep-rooted crops in an excellent soil are compared with those in artificially compacted or naturally firmer subsoils. Differential irrigation treatments are applied, and crop responses to treatment measured.

Water-logging during irrigation and subsequent drainage are being evaluated on natural and artificial profiles, and drainage conditions related to root disease.

SUPPORTED BY U.S. Dept. of Agriculture
California State Government

2.0091, IRRIGATION OF FIELD AND TRUCK CROPS

D.W. HENDERSON, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Most of the work is carried on under natural field conditions, and includes frequency of irrigation on yield and quality of the product. The measurements usually include soil moisture conditions at various stages of plant development, evapotranspiration, and root development in relation to soil conditions and development of the plant. Work has been performed on many crops; at present, the following crops are being investigated: cotton, sugar beets, potatoes, grain sorghum, safflower, and beans. Additional crops will be added from time to time.

SUPPORTED BY California State Government

2.0092, CHANGES IN ENZYMES IN THE PLANT AS RELATED TO WATER SUPPLY AND USAGE

T.C. HSIAO, Univ. of California, School of Agriculture, Davis, California 95616

The effects of various degrees of water deficits on the levels of several enzymes in the plant closely related to water usage and organic synthesis will be determined. These enzymes are: amylase, glycolic acid oxidase, the enzymes in the carboxylative phase of photosynthesis (phosphoriboisomerase, phosphoribulokinase, and ribulose-1, 5-diphosphate carboxylase), and nitrate reductase. Studies will be conducted to determine whether the changes in the enzyme level caused by water stress are due to altered rate of synthesis and activation, or to changes in inhibitor concentrations. Changes in levels of enzymes which may play a role in regulating cell water potential or stomatal aperture will be related to the usage of water by the plant where possible.

2.0093, PROPERTIES OF SUBMERGED SOILS

D.S. MIKELSEN, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives (1) To study the effects of waterlogging on the biological and physico-chemical properties of California soils. (2) To determine the variable plant responses, particularly with rice, to waterlogged soil conditions and to relate this to physiological processes. (3) To study the changes occurring as a result of waterlogging and alternate drying on soil reaction, redox potential, specific conductance and certain soil chemical characteristics. (4) To identify the redox systems in waterlogged soils as they influence soil productivity and to develop methods of chemical control or modification by cultural practice.

SUPPORTED BY California State Government

2.0094, PREDICTION OF WATER MOVEMENT IN UNSATURATED SOILS

D.R. NIELSEN, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: 1. To develop an understanding of soil moisture hysteresis and to define its role in the movement of water, solutes, and energy in soil. 2. To devise and test methods for predicting water transmission through soils from measurable soil properties for known temperature conditions.

Description: Special techniques will be used to study water flowing in alternating directions through soil and other porous materials in order to arrive at an understanding of hysteresis.

Uniformity of samples will be measured by gamma ray absorption techniques. Particular emphasis will be placed upon the solute species, their concentration and their distribution within the sample. These results for known temperature conditions will be compared with equilibrium results using volumetric and gamma ray absorption techniques.

California State Government

2.0096, METHODOLOGIES FOR PREDICTING CLIMATIC SUITABILITY OF NEW AREAS FOR IRRIGATED AGRICULTURE

H.B. SCHULTZ, Univ. of California, School of Agriculture, Davis, California 95616

The cropping pattern of any potential or existing agricultural area is based upon those species which the climate can support. Increasing population pressures, world over, are pressing agriculture toward sites less suitable than those currently being utilized. Thus deserts, mountain regions and cold locales are being viewed as potential agricultural areas regions where population is currently sparse and climate records limited. A method of predicting climate suitability is desirable. Short term climate data from 81 climate stations in the San Joaquin Valley have been collected since 1963. Data from selected stations have been verified and prepared for machine computation. These data will be correlated with long term weather records, purchased from ESSA - Weather Bureau, to establish climatological records for the field instrument sites. The extrapolated data together with specific crop requirements will be used to predict cropping behavior. 'Watchdog' instrumentation will be continued to evaluate the effect of irrigated agriculture upon desert climate trends.

SUPPORTED BY University of California

2.0097, MECHANICS OF FLOW IN OPEN CHANNEL SYSTEMS

T. STRELKOFF, Univ. of California, School of Agriculture, Davis, California 95616

The purpose of the investigation is to develop the theory and computational methods for the analysis of open-channel flow systems in the steady and unsteady states. Analytical and experimental studies are carried out on the propagation of shock waves and continuous wave profiles in prismatic and nonprismatic channel configurations and on the details of flow fields in the vicinity of control structures.

Numerical solutions of the well known St. Venant equations for unobstructed reaches of a canal are obtained for continuous flows by digital computer using both explicit and implicit schemes; discontinuities (shocks) are studied by numerical solution of integral forms of the St. Venant equations expressing conservation of mass and momentum in finite volumes of space over finite intervals of time.

Steady curvilinear flow in the vicinity of overfalls, spillways, and gates is analyzed by potential-flow techniques which permit

2. WATER CYCLE

exact expression of the boundary conditions as integral equations describing the entire flow field. Waves emanating from a vertical gate moving in its own plane are studied analytically and experimentally.

Submerged, unsteady flow in the neighborhood of tainter gates is studied experimentally by means of hydraulic models.

Separated flow in transitions is studied in air and water models by investigating mean velocity patterns and distribution of turbulence parameters.

2.0098, HYDRAULICS OF SURFACE IRRIGATION

T.S. STRELKOFF, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Objectives: To provide fundamental surface irrigation design understanding through the investigation of the hydraulic characteristics of surface flow by (1) further development of mathematical models describing the flow in terms of the many variables involved; (2) laboratory experiments for the description and evaluation of component variables; and (3) field trails to test the validity of mathematical equations and laboratory relations as in 1 and 2 above.

Procedures: Develop mathematical models describing the flow in terms of the many variables. Specifically, study the advance and profile of a water front moving over a dry bed and through vegetation for steady and unsteady flow by developing analytical solutions and testing these solution by laboratory experiments. A numerical solution of the differential equation of the motion of water into a wide, shallow vegetated channel will be investigated. An approach based on the method of characteristics for solving equations of this nature appears to have promise. A digital computer will be used. Experimental verification of the solution will be obtained by laboratory tests on artificial and real vegetation in 1 and 4-foot wide flumes with adjustable slope.

2.0100, STUDIES ON THE MECHANISMS OF COMMUNITY STRUCTURE AND SUCCESSION IN TEMPORARY PONDS

B.A. TRIBBEY, Fresno State College, Graduate School, Fresno, California 93726

The proposed research will investigate the fundamental mechanisms of community structure and change utilizing the temporary pond ecosystem and related laboratory experiments. Part of the work will be based upon data obtained through field and laboratory studies of temporary pond communities in Central Texas. Additionally, natural and semi natural temporary ponds near Fresno, California, will be described and compared to earlier findings. Field studies will measure environmental and inter-organismic relationships, providing a basis for controlled experimentation. Laboratory work will emphasize causality. Proposed experimental work will be designed to assist in determining: 1.) The effect of temperature, light intensity, and photoperiod on developing communities; 2.) the factors controlling algal mat formation; 3.) the means by which a developing mat causes corresponding changes in community composition; 4.) the role of the

chemical environment in controlling community composition; 5.) the impact of new species on a stable community. Work will also be performed on defined species systems to indicate: 1.) The relative importance of predation, competition, and chemical modification in the elimination of early seral stages by later seral stages; 2.) the presence of reciprocal acceleratory effects between species of similar seral stages; 3.) the importance of environmental variation in determining the outcome of competition between related species. Laboratory work will be based upon results obtained from studies on natural communities.

2.0101, CRATER LAKE VERTICAL TEMPERATURE PROFILES

L.E. EGEBERG, U.S. Navy, Radiological Defense Lab., Hunters Point - San Francisco, California 94135 (AT(49-7)-3000)

The purpose of this project was to obtain temperature profiles of Crater Lake. The data obtained will serve as basic information for several other projects devoted to soil and water sampling analysis in connection with a broad program of worldwide radioactive fallout assessment.

The lake is located in south-western Oregon in a sub-alpine environment. It is approximately 5 1/2 mi. in diameter and 1932 ft. deep at its deepest point. There are no surface inlets or outlets to the lake. The surface very rarely freezes and then only for short periods during extremely severe winters.

The profiles were obtained by lowering a platinum thermometer through the water column and measuring the change in electrical potential across the thermometer due to the linear relationship between the temperature and the electrical resistance of the thermometer. Corrections were made concurrently for changes in the battery power supply and fluctuations in the resistance of the thermometer lead wire due to changes in its temperature. The absolute values of temperature are accurate to plus or minus 0.1 degree C.

Four profiles were obtained to depths of 496 ft., 1916 ft., 43 ft., and 696 ft. The first two were taken 2 mi. south of Cleetwood Cove; the third, 1 mi. south of Wizard Island; the fourth, 1 mi. southwest of Llao Rock. All profiles were taken between 3 August and 6 August 1967. Raw data reduction has not been completed.

2.0102, RESEARCH TO DETERMINE THE FEASIBILITY OF NUCLEAR EXCAVATION

B.C. HUGHES, U.S. Army, Nuclear Cratering Group, Livermore, California

The overall objective of this research program is to develop the capability to employ nuclear explosive construction techniques on civil works projects which involve large-scale earthmoving or rock excavation. The three major activities being accomplished under this research program are: (1) engineering studies of project feasibility; (2) small-scale cratering experiments; and (3) investigations of engineering properties of nuclear craters.

The purpose of the engineering studies of project feasibility is to isolate problem areas, to develop those items which must be included in a nuclear excavation design and to develop a basis which can be used to adjudge the applicability of the use of nuclear explosives to specific projects.

The small-scale cratering experiments are undertaken in order to establish the design criteria for nuclear emplacement and to obtain model data from which to predict the results of full-scale nuclear events.

The objective of the engineering properties of nuclear craters investigation program is to determine how a nuclear cratering explosion affects the immediate geologic environment and what will be the resulting stability of the crater slopes and the effect on other engineering aspects, such as foundation and utility design for adjacent structures.

2.0104, PACIFIC OCEAN INFLUENCE UPON CALIFORNIA RAINFALL

J. BJERKNES, Univ. of California, Graduate School, *Los Angeles* -- U.C.L.A., *California* 90024

In project research for the National Science Foundation carried on by the principal investigator it has been found that the Pacific Ocean temperature varies more from year to year near the equator than it does in adjacent areas to the north and south. It has also been demonstrated that the inter-annual variation in heat and moisture input from the equatorial belt of the oceans in the few instances investigated does influence the global pattern of the atmospheric circulation. On the basis of this experience it is tentatively assumed that the variation of rainfall from year to year in California, and other areas around the Pacific Ocean, primarily results from the variability of the water temperature at the equator.

It is planned to test this hypothesis by assembling maps of the atmospheric circulation for all winter seasons during which equatorial water temperature measurements were carried out. Next, the map types will be correlated on the one hand with equatorial water temperatures and on the other with the historical rainfall record in California.

The problem of estimating the yield of a rainy season on the basis of atmosphere and ocean data, available before the rains start, will be investigated.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of California

2.0105, EFFECT OF RANGE MANAGEMENT ON INFILTRATION, RUNOFF, AND EROSION

R.H. BURG, Univ. of California, Agricultural Experiment Sta., *Los Angeles* - U.C.L.A., *California* 90024

Develop improved devices and techniques for hydrologic studies. Determine relationships between precipitation intensity, runoff rates, and erosion rates throughout range improvement program. Develop formulas for estimating the magnitude of flood discharge. Determine the effectiveness of new vegetation in controlling erosion. Determine the effects of fire on infiltration rates of soils. Determine hydrologic effects of various grazing practices used in management programs.

Description of Work Los Angeles: Work is concerned with the disposition of precipitation on watersheds, with erosion and with dry creep. The work included in RRF W-32 is excluded. Major emphasis, at the moment, is in development of techniques to quantitatively evaluate subsurface flows, and plots, therefore, have been established on the San Dimas Experimental Forest, Pacific Southwest Forest and Range Experiment Station, USFS. Other laboratory studies concern evapotranspirational use of water by various types of watershed vegetation.

2.0106, HYBRID COMPUTER SIMULATION OF GROUND-WATER BASINS

W.J. KARPLUS, Univ. of California, School of Engineering, *Los Angeles* - U.C.L.A., *California* 90024

The purpose of the proposed research is three-fold: the primary objective is to establish the feasibility of employing a specialized hybrid (analog-digital) computing technique for the treatment of important mathematical and physical problems arising in ground-water pollution control. To this end it is intended to adapt a computational method developed at the University of California, Los Angeles by constructing a special network specifically applicable to ground water problems. The resulting model then will be applied to several ground-water problems existing in southern California. A second more general purpose of the research is to develop the technical skills required for a long-range attack on ground-water pollution problems. A subsidiary objective of the program is to provide a training ground for doctoral and master's engineering students so as to assure a supply of technical specialists adequately trained in the physics of ground-water control and in computer technology.

2.0110, A COMPARATIVE STUDY OF SODIUM TRANSLOCATION IN PLANTS

A. WALLACE, Univ. of California, School of Engineering, *Los Angeles* - U.C.L.A., *California* 90024

The major objective of this study is to elucidate the mechanism(s) and/or further characterize the process by which a

2. WATER CYCLE

large number of, but not all, plant species transport water which is almost free of sodium from roots to shoots while simultaneously removing large quantities of sodium from the water and retaining the sodium in the roots. A secondary objective is to study physiological aspects of the adaptability and tolerance of different plants to saline habitats. Tobacco is a species which has a strong root pressure exudation from detopped plants and one in which relatively large quantities of solution are exuded which can easily be collected and analyzed. Under certain conditions such plants can be placed into very saline solutions and exude large quantities of solution essentially free of sodium. We propose to use tobacco for a portion of the present studies. Electrochemical potentials between exudates and external solution will be measured according to the methods of Bowling and concentrations of individual ions in the external solution and exudate will be determined by standard procedures. A wide variety of external solutions for bathing roots of detopped tobacco will be used including single salt and double salt solutions of different concentrations and full nutrient solutions at different temperatures. Inhibitors of metabolism including ATPase inhibitors, electron transport inhibitors, and uncouplers of oxidative phosphorylation will be studied. The amount of sodium appearing in the exudate will be monitored on an hourly basis in many of the studies. This is important because of the fact that a detopped plant has a fixed amount of energy reserves and we already know that sodium translocation to shoots is intimately related to metabolism. We hope from all these data to construct a mathematical and/or biochemical model for translocation of sodium from roots to shoots of at least this one species. For contrast, a series of studies will be made on some of the Atriplex species which readily translocate sodium from roots to shoots.

2.0111, SOIL TEMPERATURE AS A CRITERION FOR ALLOCATING WATER SUPPLY FOR CROP USE

A. WALLACE, Univ. of California, Water Resources Center, Los Angeles - U.C.L.A., California 90024

Responses of different plant species to different soil temperatures at limiting soil moisture is being explored. Since water requirement in terms of amount of water needed for production of a unit weight of plant material sometimes increases with increasing soil temperature, it can be expected that when soil moisture becomes limiting plant growth can, within limits, be better for areas where soil temperature is not extremely high. The study is being made to evaluate this concept and to define the limits for which it could be valid. The information is important to those responsible for decisions concerning mass movement of water supplies from one locality to another.

Plants are being grown in soil in containers in existing temperature control tanks so that soil temperature can be varied from less than 50 degrees Fahrenheit to over 100 degrees Fahrenheit. Soil moisture levels are being varied and monitored by daily weighing of pots so that uniform soil moisture conditions can be maintained at different temperatures. Steps will be taken to minimize evaporation from the soil surface as a variable factor. Species that do well under arid conditions are being compared with species that do not do well under arid conditions. Sandy soils are being compared with clay soils. Plant growth and transpiration measurements are being made to assess the effects of soil temperature. Some native desert species are proving to be of considerable interest.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of California

2.0112, TRITIATED WATER STUDIES OF THE SIGNIFICANCE OF DEW AND VAPOR IN PLANT WATER ECONOMY

A. WALLACE, Univ. of California, Water Resources Center, Los Angeles - U.C.L.A., California 90024

The contribution of water vapor and dew to the water economy of plants under arid conditions and when soil moisture is limiting is being explored. Such information may make it possible to better select plant species for specific purposes in specific areas to minimize the need for irrigation. Water supplies could, therefore,

be conserved if necessary. The use of tritiated water as a technique for evaluation of vapor and dew is being used on a limited basis. Exchange of vapor water with leaf water and free-surface water presents a problem to its use. Other methods are being used for the evaluation of vapor and dew use including the assessment of apparent water use per unit of dry matter production.

The kinetics of water absorption by leaves from a tree-water surface by different species grown under conditions to give varying water potential will be measured. The conditions include: salt content, varying soil moisture, day vs. night, and physiological stresses on plants such as phosphorus deficiency.

Water vapor absorption by leaves of plants is being studied at different levels of relative humidity and at varying leaf potential conditions as listed above.

The physiological effects on plant behavior of water availability as dew and/or vapor through leaves is being explored. Growth measurements will be detailed.

SUPPORTED BY University of California

2.0113, THE STABILITY OF WATER FLOWS OVER A HEATED OR COOLED SOLID SURFACE

A.R. WAZZAN, Univ. of California, School of Engineering, Los Angeles - U.C.L.A., California 90024

This is a study of the effects of either heated or cooled walls upon the stability of water flows over solid surfaces. The optimum rate of heating for increased stability is to be determined as a function of free stream temperature and wall temperature.

The stability of laminar boundary layer is sensitive to the pressure gradient. Adverse pressure gradients have a destabilizing effect on the boundary layer which can possibly be countered with laminarization by heat transfer into the boundary layer. Boundary layer velocity profiles will be determined and compared with the isothermal Blasius profile particularly in the region of the neutral stability profile. The magnitude of the total stabilizing effect of the heat transfer will be determined through comparison of amplification rates for each profile.

2.0114, STUDIES OF TRANSPIRATION LOSSES

J.W. BAILEY, U.S. Dept. of Interior, Geological Survey, Menlo Park, California

Make studies of transpiration losses through native vegetation to determine, by use of evapotranspiration tanks and other means, the quantity of water annually consumed by the different species of phreatophytes at selected locations, the quantity, and quality salvageable by elimination or control of these phreatophytes, and related data. Phreatophytes studied are *Sarcobatus* spp. (Greasewood), *Chrysothamnus* spp. (Rabbit brush), *Salix* spp. (Willow), and *Rosa* spp. (Wild Rose). Water is applied through underground pipes and evapotranspiration losses are metered throughout the year.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0115, GEOCHEMICAL CONTROLS OF WATER QUALITY

I. BARNES, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

Reactions between water and minerals in near surface environments are being studied as apparent controls on the natural water compositions. The properties of surface and ground waters are determined by chemical analysis and electrochemical potential measurements (Eh and pH, for example) in the field. The properties of the water are then described with reference to equilibrium states between the water and possible coexisting phases.

2.0124, HYDROLOGY OF HUNGRY HORSE RESERVOIR MONTANA

M.I. RORABAUGH, U.S. Dept. of Interior, Geological Survey, Menlo Park, California

Operation of the Hungry Horse Reservoir, Montana revealed the need for determining more accurately the volume of water, including bank storage, available for power production, and need for forecasting reservoir inflow during the lowflow season.

The program has included: collection of data to define the components of inflow and outflow with sufficient accuracy to determine the hydrologic parameters of the reservoir, analysis of the components of the water budget to improve procedures for forecasting reservoir inflow volumes during the lowflow period; and the further testing of techniques for expressing the relationship between ground-water storage and stream runoff.

Discharge records were collected at over 30 sites in the area. Stage records were obtained at the upper and lower ends of the reservoir. Stage and water temperature measurements were obtained from 6 groundwater wells around the reservoir. Evaporation from the reservoir was determined by an energy-budget study. Radiation and meteorological data were collected at the dam. Two raft stations furnished water-surface temperature and wind velocities. Thermal profiles were measured at 23 locations in the reservoir and at the raft stations. Additional precipitation data were collected at 3 other sites around the reservoir. Project started July 1964; scheduled for completion fy 1969.

2.0125, UNSATURATED FLOW THEORY APPLIED TO DRAINAGE AND INFILTRATION

J. RUBIN, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

The objective of this is to study critically the applicability of the current theory of fluid flow through unsaturated porous media to the phenomena of drainage and infiltration, with a view of facilitating this theory's utilization in the analysis of ground water flow and runoff problems.

Utilizing the current isothermal unsaturated flow theory, carry out mathematical analysis which makes it possible to predict soil moisture movement under a variety of initial and boundary conditions. Study conditions which can be utilized for examining the soundness of theoretical foundations and those which are pertinent to the hydrologic phenomena of interest. Test in the laboratory the theoretical results obtained. In later phases, start developing means for testing and utilizing the theory under consideration in the field.

2.0126, INFLUENCES OF WATER-SEEPAGE CHARACTERISTICS ON THE COMPOSITION OF EXCHANGEABLE PORE-WATER SOLUTES

J. RUBIN, U.S. Dept. of Interior, Geological Survey, Menlo Park, California

Quality of ground waters often is significantly affected by the solute composition of the recharging seepage. The theoretical tools needed for analyzing and predicting such influences are imperfectly developed.

The first phase of the project will involve a study of the effects of soil moisture content upon cation exchange processes which take place during seepage through water unsaturated soil columns. Interpretation of the results obtained might be aided by supplementary studies of thin film flow on large crystals of clay-

like minerals and of seepage through clays at various degrees of consolidation.

The second phase of the project will involve theoretical and experimental studies of two-dimensional, exchange-affected dispersion of cations during steady-state flow of solutions through water-saturated slabs of earth materials.

The last phase of the project will involve theoretical and experimental investigations of cation dispersion during one-directional seepage, the dispersion being affected by two interdependent chemical reactions.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0127, WATER QUALITY AND NUTRIENTS, SACRAMENTO-SAN JOAQUIN RIVER SYSTEM

W.D. SILVEY, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

This research is part of the program of water resources investigations conducted by the U.S. Geological Survey in cooperation with the State of California. The total project is to provide the knowledge needed to avoid excess blooms of tidal plankton and undesirable concentrations of dissolved oxygen by determining the relationships between nutrients, tidal plankton, dissolved oxygen, and fish in this estuarine environment. The water quality aspects of the study includes source and concentration of both organic and inorganic constituents in waters in the delta system together with pertinent physical characteristics.

2.0128, RESEARCH IN LIMNOLOGY - INTERRELATIONS OF HYDROLOGY AND AQUATIC ECOLOGY

K.V. SLACK, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California

Biological processes are among the major controls on the quality of natural waters. Organic control on solute concentration occurs in two ways: substances enter or leave solution either as the results of changed physico-chemical conditions in the water, or as the results of physiological processes within living cells or at their boundaries.

The work is divisible into three related phases:

Phase 1. Stream Limnology. a. The effect of stream-bed algae on water quality will be studied in flowing-water cultures (laboratory streams) in which temperature, light intensity, flow rate, water composition and algae species can be controlled. The first problem being studied is the uptake and release of combined inorganic nitrogen by mixed populations of stream algae. b. Investigation of the physical, chemical and biological properties of different types of natural streams will continue. The emphasis will be on the interrelations of the biota and water quality.

Phase 2. Lake and reservoir limnology. a. Effects of reservoir destratification. The hydrologic effects of destratification will be studied experimentally by isolating portions of a stratified reservoir in polyethylene cylinders extending from the water surface to the bottom. b. Environmental controls on phytoplankton populations. This will combined the results of field investigation with controlled laboratory studies of static and flowing cultures of nuisance species of algae.

Phase 3. Ecological role of natural organic compounds in water. The particular emphasis will be on the identification of organic compounds which influence biological activity in natural waters.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0129, VERIFICATION OF MASS-TRANSFER AND PAN EVAPORATION RELATIONSHIPS FOR LARGE LAKES AND RESERVOIRS (SALTON SEA, CALIFORNIA)

A.M. STURROCK, U.S. Dept. of Interior, Geological Survey, Menlo Park, California

The objective is to determine if existing mass-transfer and pan evaporation relationships can be used to estimate evaporation from large lakes. The control will be the water-budget and energy-budget methods. Areal variations in solar and atmospheric

2. WATER CYCLE

radiation will be measured, thermal surveys will be conducted, and conductivity measurements will be made to define the effect of salinity on saturation vapor pressure.

2.0130, CRITERIA FOR PUBLIC INVESTMENT IN NATURAL RESOURCES

K.J. ARROW, Stanford University, Graduate School, Palo Alto - Stanford, California 94305

Significance: One of the most debated aspects of natural resource conservation and development is the measurement of costs and returns from investment in resources over time. These investments involve returns to future generations and by public as well as private organizations. Much of the debate has taken the form of an argument over the rate of interest to be applied in discounting future benefits from a current investment. A difference of one per cent in the interest rate applied can alter very greatly the estimate of future returns to be compared with current and future costs. There is no other single factor of such crucial importance to the determination of what constitutes optimum investment in natural resources. A fairly large body of literature exists on this subject, including a number of quite recent studies by competent economists. These contain many disagreements of varying significance. A study which would bring this whole issue into focus and lead to its resolution would be of inestimable value.

Specific Aim: To synthesize the large body of literature on criteria for public investment and to arrive at a statement of the necessary and sufficient conditions under which government should undertake an expenditure, the fruits of which are deferred to the future.

Method of Procedure: The study involves primarily library research and analysis, much of which would be of a theoretical nature. Professor Arrow would be assisted by several research assistants in the examination of existing literature while he would concentrate on the new and creative aspects of the endeavor.

2.0134, GEOCHEMICAL STUDIES WITH STABLE AND RADIOACTIVE ISOTOPES

R.P. SHARP, Calif. Inst. of Technology, Graduate School, Pasadena, California 91109 (AT(04-3)427)

The work proposed for 1968 involves the geochemical distribution and behavior of various isotopes in natural systems. Some of these isotopes are the product of currently active radiogenic systems and processes; others are the product of atomic processes long since dead. All are useful for determining what has happened to natural systems and under what conditions.

This next year considerable attention will be directed to the thorium-uranium-lead system. Besides using it as a tool for geochronological determinations, investigations of the vagrancies of the system and its susceptibility to changes in environmental conditions are to be made. The aim is to improve the reliability and versatility of this system for use in solving geological problems. The Th-U-Pb system will be investigated in the field through study of carefully selected rock bodies of similar age but different environmental histories, by comparisons with other radiogenic isotopic systems in these rocks and in individual mineral specimens therein, and by means of laboratory experimentation on selected natural specimens.

Oxygen, hydrogen, and carbon isotopes are abundant and widely distributed elements in most inorganic and organic earth materials. Variations in the ratios of these isotopes, for example, O18/O16, D/H, C13/C12, give useful information on the environmental conditions under which substances containing them formed. They also provide a means of determining alterations in such materials subsequent to their formation.

We anticipate a better understanding of the Th-U-Pb systems that will enhance its use in geological and geochemical investigations. We hope to get an historical perspective on atmospheric pollution. We anticipate improved use of oxygen, hydrogen, and carbon isotopes in determining the conditions and sites of mineral and rock origin and subsequent alteration.

SUPPORTED BY California State Government
U.S. Dept. of Agriculture

2.0137, IRRIGATION STUDIES WITH VEGETABLES

G.H. CANNELL, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

To formulate better criteria for programming irrigation of vegetables. Factors considered in relation to irrigation are: soil physical properties, fertilizers, and soil salinity. Water requirements for various vegetable crops in a range of environmental conditions will be made.

Little technical information on the effects of irrigation on vegetable crops has been reported for southern California. With irrigation water becoming a high-cost factor in vegetable production in certain areas and with the prospect of higher costs, less water, and water of poorer quality, studies in water use and salt effects from irrigation are thus imperative.

While irrigation based on soil-water relations is basic, a more general approach to measurement of effects in the plant as well as those in the soil will be included as part of this study. Improvement of existing equipment and designing of new devices for the measurements mentioned are being carried out in these studies.

SUPPORTED BY California State Government

2.0138, DISTRIBUTION OF DIATOMS IN DESERT WATERS

L.H. CARPELAN, Univ. of California, Graduate School, Riverside, California 92502

This is a renewal of GB-3500 for the completion of studies of desert limnology. Field studies are concerned with the distribution and survival of branchiopods in semi-permanent desert waters (dry lakes), the productivity of the dry lakes, and respiration of the branchiopods. The aim is an analysis of the energetics of this very difficult environment.

SUPPORTED BY U.S. National Science Foundation

2.0139, MOISTURE CONTROL AND ITS RELATION TO CULTURAL PRACTICES FOR CITRUS, TREE, AND VINE CROPS

W.W. JONES, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

Objectives: (1) To measure the response of the tree to water application based on soil moisture suction or other indices of soil moisture status. Evaluation of the interactions between soil moisture, climate rootstocks, fertility and other cultural factors will receive special emphasis. (2) To evaluate various techniques and methods of applying water to the soil. Emphasis will be given to studies concerned with the possibilities and implications of automation in irrigation. (3) To evaluate morphological and physiological responses of trees to soil moisture variables both for newly planted trees and producing trees. (4) To evaluate the moisture flow characteristics of various soils in relation to efficient irrigation application.

DESCRIPTION OF WORK - Soil moisture movement and availability in different soils will be studied in relation to moisture tension in both orchards and the greenhouse. The orchard experiments will be carried out in specific soil and climatic areas of the State to obtain information representing a wide range of conditions. Work will be conducted in university controlled land and on privately owned orchards.

2.0140, CHARACTERIZATION OF SOIL NONWETTABILITY AND THE DEVELOPMENT OF CRITERIA FOR THE MOST ECONOMIC TREATMENT OF THESE SOILS

J. LETEY, Univ. of California, School of Agriculture, Riverside, California 92502

Soils which repel water and are commonly referred to as non-wettable soils have been reported in many areas of the world.

Large percentages of areas burned by forest fires exhibit non-wettable soils. Nonwettable soils can be treated with wetting agents to make them wettable and increase water infiltration.

The proposed research will involve developing criteria to predict the most effective and economic treatment of a nonwettable soil with wetting agent to increase water movement through the soil. The necessary parameters will be measured and predicted water infiltration will be compared with calculated values. The parameters to be measured are: critical surface tension of soil, wetting agent adsorption by soil, wetting agent concentration relationship with solution surface tension, and depth of soil affected.

The release of surfactants by soils as affected by various factors will be investigated to predict the longevity of a surfactant treatment and to provide estimates of possible long-range ground water contamination.

A field survey will be undertaken to gain a better evaluation of the extent of nonwettable soils.

University of California

2.0141, THE ROLE OF SOIL WETTABILITY AND TREATMENT WITH WETTING AGENTS ON WATER MOVEMENT AND SOIL PHYSICAL PROPERTIES.

J. LETEY, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

A study is proposed to investigate the effect of wettability and treatment with wetting agents on physical conditions of and water movement in soils. The nature of the organic substances causing reduced wettability, and the influence of texture, type of clay, and types of microbial population on soil wettability will be investigated. The absorption, replacement, and leachability of wetting agents will be studied to determine most effective treatment practices and probable duration of beneficial effect. The effect of wettability and treating with wetting agents on structure, soil strength, and particle arrangement will be studied because these factors also influence water flow. The results of the proposed research will assist in the proper incorporation of soil wettability in the hydrologic cycle.

SUPPORTED BY California State Government

2.0144, LYSIMETER INVESTIGATIONS OF GAINS AND LOSSES OF MINERAL ELEMENTS

P.F. PRATT, Univ. of California, Agricultural Experiment Sta. ,
Riverside, California 92502

Study, under the controlled conditions possible with lysimeters, the effect of treatment of soils with fertilizers and other chemicals and irrigation waters on the gains, losses, balance, and trend of all of the important mineral elements of soils, to study the effect of long-term use of chemicals and waters on crop yields, and crop yield trends in relation to the chemical, physical, and biological properties of soils. Specific objective of work of immediate future is to study the effects of acid, neutral, and alkaline-forming nitrogen fertilizers, cropping and irrigation on yields, properties of soils, and gains and losses of mineral elements in the soil or added to the soil.

Description of Work: Two crops are grown each year on four different soils fertilized with three different nitrogen fertilizers. The crops are harvested, weighed and analyzed so that depletion by cropping can be calculated. Samples of all fertilizers and water added to the soils are analyzed to determine the elements added in these materials. At least once each year the soils are leached, the volume of leachate measured and a sample analyzed. Thus, the losses and/or accumulations of fourteen elements are being measured and related to soil type and to the source of nitrogen fertilizer.

2.0146, SOIL PHYSICAL CONDITIONS IN RELATION TO IRRIGATION

S.J. RICHARDS, Univ. of California, Agricultural Experiment Sta. ,
Riverside, California 92502

Develop and improve techniques for characterizing and measuring soil physical properties. Evaluate the factors which affect water entry and movement in soils. Evaluate the factors which affect aggregation and aggregate stability.

Description of work: Measure unsaturated water conductivity of soils over wide ranges in soil suction. Develop and calibrate instruments for measuring soil moisture conditions in terms of soil suction in the range 1 to 10 bars. Develop laboratory techniques for evaluating soil structure and correlate these techniques with field and plot irrigation management. Use compacted bulk density and hydraulic conductivity as indices to evaluate the effects of chemical amendments and of soil improving practices being carried out in cooperative trials with growers and farm advisors. Evaluate and improve methods of measuring water retention by soils and soil mixes. Measure oxygen requirements for soil aeration and evaluate soil aeration under irrigation practices where leaching is required. Under commercial practices, compare furrow and sprinkler irrigation of citrus in terms of fruit sizing and leaf analyses.

New laboratory and field procedures are being developed for aggregate analysis and characterization of aggregate stability, and factors affecting same.

2.0147, FACTORS INFLUENCING THE FLOW OF SUB-SOIL WATER IN THE IMMEDIATE PROXIMITY OF, AND INTO DRAINAGE FACILITIES

S.J. RICHARDS, Univ. of California, Agricultural Experiment Sta. ,
Riverside, California 92502

Objectives: 1. Determine the combination of soil grain sizes most likely to plug a tile joint. 2. Investigate a wider variety of filter materials which might be used in practice to reduce tile joint plugging. 3. Look for other soil factors (physical, chemical, or microbiological), in the model studies which might give further leads relative to the general problem of ineffective tile drainage in the Coachella Valley.

Work Proposed: 1. Working primarily at UCR but with soil and filter material initially from the Coachella Valley, set up model drainage systems approximately 2' x 2' x 3' in size. Evaluate the tendency for joint plugging by head loss measurements under measured flow rates. Study the plugging potential of various soil separates and soils of varying structural and mineralogical status. 2. Measure water conductivity and compaction properties of typical soils from the Valley to determine whether these factors can be eliminated in relation to the drainage difficulties. 3. When justified on the basis of preliminary experiments, use radioactive tracer techniques to tag soil particles and study their movement under controlled model conditions.

2.0148, SOIL-MOISTURE-PLANT RELATIONS OF AVOCADO TREES

S.J. RICHARDS, Univ. of California, Agricultural Experiment Sta. ,
Riverside, California 92502

Objective: Evaluate soil water conditions as a factor in the growth, vigor, and production of avocados, and cooperate in the evaluation of the interactions of soil moisture and air temperature with nitrogen fertilization and root rot diseases.

Work Proposed: Modify treatments on Has avocado trees, CRC 20C, to investigate automatic irrigation and air temperature amelioration during peak temperatures in summer. Establish irrigation and nitrogen fertilization treatments on plots, Field 4, at the South Coast Field Station to evaluate their effects on Bacon avocado trees. In greenhouse and lathhouse experiments, study layer soil conditions to explain the lack of normal root growth in 'sandy' type soils.

SUPPORTED BY California State Government

2.0149, A STUDY OF THE PRIMARY PRODUCTIVITY OF NEW AND OLDER RESERVOIRS

R.R. RAWSTRON, State Dept. of Fish & Game, Sacramento,
California

Premises: Decreasing primary productivity has been blamed for declines in fish population during the years following impoundment. Merle Collins Reservoir (Virginia Ranch Reservoir) is a newly impounded water and offers an opportunity to discover and follow the changes in primary productivity (represented by algae production) which may occur. An attempt will be made to associate these changes with changes in fish production there.

Water withdrawal and climatic conditions affect limnological conditions in large reservoirs; these in turn may affect fish production. Folsom Lake water is generally withdrawn from near the lake surface, whereas Merle Collins has a bottom outlet.

Procedure: Limnological variables including dissolved oxygen, total alkalinity, total organic matter content, temperature, pH, conductivity, and primary productivity as radioactive carbon (C14) uptake will be measured weekly during March through October and biweekly during the remaining months at both Folsom Lake and Merle Collins Reservoir. One station has been

2. WATER CYCLE

established at each water. Limnological data collection will cease on June 30, 1967, at Folsom Lake. Three years of comparable data will be available at that time.

If detectable changes in primary productivity and other limnological variables do occur, these changes will be compared to help test the theory that the decline in fish production is related to changes in primary productivity.

Climatic and water withdrawal data for Folsom Lake will be taken from Bureau of Reclamation records. Brown's Valley Irrigation District and Weather Bureau records will supply identical information for Merle Collins Reservoir.

2.0152, LAND SUBSIDENCE STUDIES IN THE SAN JOAQUIN VALLEY

J.F. POLAND, U.S. Dept. of Interior, Water Resources Division, Sacramento, California 95814

Objectives of this project are to study the extent, magnitude, rate, and causes of land subsidence in the San Joaquin Valley, Calif., to furnish criteria for estimating the amount of subsidence that would occur under assumed hydrologic change, to determine whether subsidence is reversible in part, and to suggest ways for stopping or ameliorating subsidence.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0153, MECHANICS OF AQUIFER SYSTEMS

J.F. POLAND, U.S. Dept. of Interior, Water Resources Division, Sacramento, California 95814

The objectives of this project are to determine the principles controlling the deformation (compaction or expansion) of aquifers or aquifer systems resulting from change in grain-to-grain load, caused chiefly by change in internal fluid pressure; to extend existing leaky-aquifer theories to multi-layered aquifer-aquitard systems so that pumping test techniques can be used to obtain meaningful hydraulic coefficients in heterogeneous alluvial deposits; and to appraise the meaning and utility of the coefficient of storage as derived from short-term aquifer tests in relation to long-term values for aquifer systems that have undergone substantial compaction; also the change in the coefficient of storage in compressible aquifer systems as a result of change in hydrologic environment.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0154, SMALL-SCALE CIRCULATIONS OF THE SAN FRANCISCO BAY AREA

A. MILLER, San Jose State College, Graduate School, San Jose, California 95114

The objective of the proposed research is to design and carry out specific experiments in atmospheric dynamics in the lower San Francisco Bay region. Physical-mathematical models will be developed of the following phenomena: (1) the sea breeze beneath an inversion; (2) waves within the inversion; (3) formation, oscillations and dissipation of jets within the inversion layer; (4) exchange processes between the marine layer and the dry air aloft; and (5) the channelling of flow by the mountains.

The research will be carried out using the techniques and observational methods developed over the years by the group at San Jose State College. This includes three M-33 tracking radar systems with data acquisition systems. Aircraft instrumentation includes sensors for pressure, dry bulb temperature, and wet bulb temperature. Tetroons, pibals and radiosondes are flown during the experimental periods. It is expected that at least 15 complete field experiments will be conducted during the grant period.

SUPPORTED BY U.S. National Science Foundation

2.0155, EFFECT OF CHARGE UPON COLLISIONS IN WASHOUT

T.G. OWEBERG, T.G. Owe Berg Incorporated, Santa Ana, California (AT(04-3)-673)

Objective: To determine the effect of charge of atmospheric particles and rain drops upon collisions in washout of atmospheric debris by rain.

Background: The encounter between a falling drop and a small particle is affected by the flow field around the drop, by forces of inertia and electrostatic forces, and motion of the particle relative to the drop. The particle trajectory is the integrated form of the equation of motion. The probability of collision, the collision efficiency can be determined when the trajectory is known. The collision efficiency in turn determines the collection (or washout) efficiency.

Procedure: Trajectories of particles in the vicinity of drops and particle distributions on drops are determined by high-speed photography through the microscope at various fall velocities of the drops and various charges on drops and particles. So far, water drops of 2 to 2.5 mm in diameter and Lycopodium particles of 32 micron diameter have been used. The fall velocity of the drop has been varied up to 5 m/s. The terminal velocity is 9 m/s for such a drop. So far only the average particle charge has been measured, but means are under development for the determination of individual particle charges.

SUPPORTED BY U.S. Atomic Energy Commission

2.0156, EFFECT OF THE WARM CLOUD BASE UPON CLOUDSEEDING FROM THE GROUND

T.G. OWEBERG, T.G. Owe Berg Incorporated, Santa Ana, California

The work is part of Project Skywater. It is conducted in the laboratory of T. G. Owe Berg, Inc., 2189 South Grand Avenue, Santa Ana, California. The interaction of silver iodide particulates with water vapor and water droplets is studied, specially with a view to the effect of exposure to these conditions at the cloud base upon the effectiveness of the silver iodide as a seeding agent. The results obtained indicate that silver iodide forms ice crystals with water vapor that is supersaturated with respect to supercooled liquid water, and that such ice crystals may initiate freezing of cloud droplets provided the droplets and the ice crystals are electrically charged. Observations are made under the conditions of the cold chamber and the expansion chamber and also with single droplets or particles suspended in a nonuniform ac field. Matters of particular concern are the conditions for nucleation and growth of the ice phase and how they are affected by the history of the seeding agent.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0157, FACTORS AFFECTING PRIMARY AND SECONDARY PRODUCTION IN TEMPERATE LAKES

D.W. SCHINDLER, Trent University, Graduate School, Peterborough - Ontario, Canada

Field measurements of primary production in four lakes of different morphometry will be regressed upon physical and macro nutrient factors of possible causal importance using multiple regression analysis. Corrections will be made for departures from linearity and elimination of non-significant variables. Schindler (1966) found that 75% of the variance in areal primary production measurement of a small Minnesota lake could be explained by such treatment. This study will be an attempt to expand the treatment to include production at different depths and in different types of lake basins.

Zooplankton production will be calculated using the method of Schindler (1967) from zooplankton birth rates and the average size of animals at death, allowing estimates of production by the entire plankton community, and by each species of zooplankton.

Results will be compared with each other and with those of Severson Lake, Minnesota, in order to identify and quantify general principles affecting production in water bodies of all types.

Data will also be analyzed for inter and intraspecific competition, predation, and their mode of operation.

The effect of micro-nutrient limiting factors on primary production will be investigated experimentally.

2.0161, FEASIBILITY OF USING ATMOSPHERIC WATER RESOURCES IN THE NORTHEASTERN UNITED STATES

E.J. AUBERT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The objective of this initial study is to assess the potential feasibility (technical, benefit, cost) of utilizing the atmospheric water resource in the Connecticut River Basin.

The specific goals are: (1) Assess major features of stress in supply and demand in the present and planned water resource system, users and uses which are relevant to the atmospheric water resource; (2) Identify requirements for and estimate potential

benefits from the atmospheric water resources for preliminary assessment purposes; (3) Estimate the climatology of precipitation potential and seedable situations; and, (4) Assess the preliminary feasibility of developing the atmospheric water resource in the Connecticut River Basin.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0162, ATMOSPHERIC WATER RESOURCES RESEARCH UNIVERSITY OF WYOMING

J.E. BELLAMY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

During the 1968-69 winter season the activities at the Elk Mountain Water Resource Observatory will be to conduct studies of the environment within which the Elk Mountain cap cloud occurs, the inflow into this cloud, the nucleation of this cloud, the growth of the precipitation particles within the cloud, and finally its precipitation in order to continue the development of sound snowpack augmentation procedures.

The environmental studies will determine the synoptic situation, thermodynamic stabilities, and cloud and ice nuclei activation spectra within which the cap cloud occurs. The source of water vapor which produces the layered cap cloud will also be studied.

The inflow studies will be continued and expanded in order to understand more clearly the air flow over and around a three dimensional mountain. Transport and diffusion studies will also be made to determine the most effective means of seeding a cap cloud.

The nucleation studies will attempt to determine the natural and artificial activation spectra of cloud and ice nuclei and their subsequent activation. The concentration of cirrus crystals which might nucleate the cap cloud will be sampled.

Experimental operations in the Wind River Mountains near Boulder, Wyoming will also be conducted. This program will be a randomized cloud seeding operation using ground based silver iodide generators using a one-day experimental unit.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0163, ATMOSPHERIC WATER RESOURCES PROGRAM

B.P. BELLPORT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The Atmospheric Water Resources Program is a comprehensive applied research and engineering development program directed toward enhancing and modification. The immediate objective is to determine the practicality of augmenting the streamflow into reservoirs on Reclamation projects. Definite scientific answers will be established regarding the feasible extent to which weather modification can beneficially supplement water resources for other areas.

The many aspects of integrating precipitation modification into the social and natural environment will also be studied and resolved. The necessary instrumentation, techniques and operating systems for modifying precipitation under orographic, convective and frontal situations will be developed. Early development of applicable techniques will be emphasized in regions where water supplies are most critical.

About 90 percent of the program activity is being undertaken through contracts with universities and private meteorological firms and agreements with State and other Federal agencies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0164, PARK RANGE ATMOSPHERIC WATER RESOURCES PROGRAM

E. BOLLAY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The Park Range Program, part of the Bureau of Reclamation's Project Skywater, is centered at Steamboat Springs, Colorado and has been in continuous operation since November 1964. Prime purpose of the program is the development of weather modification technology, especially as it applies to the increase or redistribution of precipitation in the mountainous re-

2. WATER CYCLE

gions of the Colorado River Basin. Major studies include 1) diffusion of AgI artificial nuclei from ground generators into orographic clouds, 2) detection of ice nuclei concentrations in the air, and of silver in precipitation samples, 3) evaluation of artificial nucleation effects, 4) determination of the precipitation meteorology of the area and 5) development of operational criteria and techniques for efficient application of artificial nucleation in this, and similar, regions. In particular, the program is investigating various approaches to intermittent (periodic or other schedule) nucleation as a method of reducing the experimental time required to determine nucleation effectiveness. Results to date indicate that periodic nucleation can be used to detect seeding effects on purely orographic precipitation.

2.0165, INVESTIGATION OF THE FEASIBILITY OF WARM-CLOUD MANAGEMENT

H.R. BYERS, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Objectives are to explore clouds that are warmer than freezing yet at or near the point of precipitating, or to discover means of influencing their precipitation.

Aircraft penetrations, radar, chaff drops, study of chemicals for modification, later tests of modification. Theoretical and observed models of convective clouds.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0166, AQUIFERS AND DRAINAGE

E.J. CARLSON, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The study deals with the movement of saline water in 1- and 2 layer ground water aquifers. A laboratory investigation was used to observe the movement of the saline water-fresh water interface for various rates of application of fresh irrigation water surcharge on the ground surface. Typical agricultural tile drains and vertical pump wells were studied in the model. They provided a location for the saline water to leave the strata. The movement of the saline water (dyed blue) was observed and the results were compared with the theoretical movement. The study has been extended to deal with drainage of sloping agricultural land. A laboratory investigation is being used to determine the distribution of discharge to tile drains for various drain spacings on sloping land. Dye tracers will be used to determine the relative depth in the aquifer from which water approaches the drain or flows down the sloping aquifer.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0167, AIRFLOW AND DIFFUSION PARAMETERS IN CONNECTION WITH ATMOSPHERIC WATER RESOURCES PROGRAM

J.E. CERMAK, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

A. Determine the full capability for simulations flow and diffusion over mountain barrier in a meteorological wind tunnel.

B. Establish the degree of correspondence between flow and transport characteristics for model and prototype.

C. Evaluate the potentials of laboratory simulation of atmospheric motions over complex terrain for operational considerations of the diffusion and transport of seeding materials.

Laboratory Simulation 1. Necessary conditions for similarity 2. Conditions for simulating diffusion and transport 3. Four topographic models will be studied 4. Some special instrumentation may be required.

Field Study 1. Study of the wind field over mountains 2. Instrumentation will be : Rawinsonde, Pilot Balloons, Kites, and Constant Level Balloons.

Numerical Study (optional) possible computer model for simulating diffusion and transport over mountains.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0168, ECOLOGICAL EFFECTS OF WEATHER MODIFICATION

C.F. COOPER, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

To analyze potential ecological impact of precipitation management programs and other weather modification programs related thereto; to identify those portions of the ecosystem most sensitive to precipitation management; and to prepare research designs by which these portions may be investigated in greater detail.

Procedures include a review and evaluation of information and data already available and of potential pertinence to the ecological effects of weather modification programs. Present and contemplated research related to ecological effects of weather modification programs will be inventoried among universities, individuals and appropriate government agencies such as the U.S. Forest Service, the Bureau of Land Management and the State Agricultural Experiment Stations. Professional specialists will be consulted on a fee basis in areas such as entomology, limnology, human ecology, paleocology, plant pathology and bio-statistics. Computer simulation models will be studied in considerable depth and research designs specifically formulated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0169, LEGAL IMPLICATIONS OF WEATHER MODIFICATION

R.J. DAVIS, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Legal implications arise from experimentation in weather modification and from development and management of atmospheric water resources. As a part of Project Skywater a study of the legal aspects of intentional weather alteration is being conducted at the College of Law of the University of Arizona in Tucson, Arizona 85721; it will be concluded in July 1968. The study undertakes a legal evaluation of the consequences of rainfall and snow control, fog dispersion, lightning suppression, hail suppression, and hurricane modification. Judicial decisions, statutes, administrative regulations, and scholarly writings that relate to weather modification activities are being examined in order to determine the legal aspects of the application of weather alteration technology. Determination will be made of what legal norms should in the future be applied to the local, national, and international consequences of weather modification activities. Based upon such findings, reports will recommend legislative and administrative action.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0170, HYDROLOGY OF PRAIRIE POTHOLE

W.S. EISENLOHR, U.S. Dept. of Interior, Geological Survey, Denver, Colorado

Because prairie potholes of North-Central United States and adjacent areas of Canada are major breeding grounds of migratory waterfowl protected by United States treaties with Canada and Mexico, this study is included in the International Hydrological Decade. One problem being studied is that of identifying those potholes that will contain water long enough that they should be preserved for use by waterfowl rather than be drained for agricultural use. A closely associated problem is that of determining the amount of water needed to keep a pothole useful for waterfowl. Another problem is that of determining the amount of seepage from potholes that may reach aquifers used for water supply in distant areas. Changes in chemical quality are being studied as it may affect the usefulness of a pothole to waterfowl.

The study is being made in North Dakota and is concerned with the processes by which water enters and leaves a pothole and a detailed analysis of the water budget, including separate computations of evaporation and transpiration from potholes filled with aquatic vegetation, to the end that adequate information will be available for the design of observation programs needed to solve water resources problems in the prairie pothole region.

2.0171, LARGE SCALE DYNAMIC EFFECTS OF CLOUD SEEDING

R.D. ELLIOTT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Objective: The objective of this contract is to conduct laboratory studies to determine large-scale dynamic effects of cloud seeding, including secondary effects that may develop at a considerable distance downwind from the primary effect.

Procedures: Research work is to include but shall not be limited to the following items: a. Spatial distribution analysis of precipitation and hydrologic data in extended regions in, around, and downwind from long-term cloud seeding projects and dynamic effects in the primary and secondary areas. b. Analysis is to consist of the following: 1) Statistical phase: To determine the general relationship between cloud seeding and dynamic effects in the primary and secondary areas. 2) Development of a physical model to explain the observed dynamic effects relating the magnitude and wave length to the basic wind pattern and terrain configuration. 3) Selection of an area and design of a field test to provide more definitive and acceptable results than can be obtained from postanalysis of historical data. c. To determine the extent of any secondary area of effect that may develop at a considerable distance downwind from the primary effect and at a place where it is unlikely that any artificial nuclei would be present.

2.0172, SKYWATER--PARK RANGE FOREST HYDROLOGY

H.C. FLETCHER, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Stream gaging and hydrologic analyses of subwatersheds of the Park Range Program area. The effect of forest cover and land management are studied so that the result of possible changes can be segregated from achievements of the weather modification program. Possible differential effects in weather modification results caused by topography or forest cover are considered to aid planning and application of weather modification to other mountain watersheds. Available information is used to develop a conceptual nonlinear model of snowmelt runoff in which streamflow is the transformation of generated snowmelt by a watershed system that delays, modulates, and attenuates input and compared to output.

Field work is carried out in the mountains of north-central Colorado especially near Steamboat Springs and Fraser. This study began in 1964.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0173, PRODUCTION AND DETECTION OF ARTIFICIAL ICE NUCLEI

N. FUKUTA, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The principal objective of this study is to establish the initial part of weather modification technology where ice nucleation is involved. Four major technical problems are to be investigated, i.e., optimization of ice nuclei for use under particular cloud condition, development of seeding materials other than silver iodide for cloud seeding programs, development of airborne and ground nuclei counter and study of cloud seedability in terms of background ice crystal and ice nuclei. Results are directly aimed at the use in the development of cloud seeding technology for precipitation management.

There are two basic approaches to the problem. One is theoretical computer modeling of microphysics of ice crystal and ice nuclei, and the other is an experimental study of it. Construction of nuclei generator testing facilities, a vertical wind tunnel, and a cold room are planned. Every part contains problems; production of organic smoke appears one of the major problems. Good coordination of theoretical and experimental effort is necessary to accelerate the work.

2.0175, ATMOSPHERIC WATER RESOURCES RESEARCH IN THE STATE OF NEW MEXICO

N.N. GUNAJI, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The purpose of this program is to conduct research in the atmospheric sciences leading to the development of beneficial weather modification procedures and to the development of techniques for atmospheric water resources management methods for application in the Rio Grande Basin upstream from Elephant Butte Reservoir within the state of New Mexico. The program was initiated 1 February 1967. Work plans which include statistical model, field operation procedures, logistics, field measuring equipment, communication system and personnel, have been completed.

A target area of approximately 200 square miles and two control areas have been selected. The target area is located within the Jemez and Sierra Nacimiento Mountain Ranges.

The proposed work for 1 July 1967 to 30 June 1968 shall include the initiation of the following: 1) identification and classification of storm systems; 2) research on agents, instruments, equipment, and techniques which may accomplish changes in cloud systems; 3) research on cloud and precipitation processes, including detection of results from weather modification efforts; 4) refinement of techniques and instrumentation for routine field operations and 5) development of long-range plans for accomplishing the objectives of this contract for the Rio Grande Basin.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0176, BADGER WASH COOPERATIVE STUDY

R.F. HADLEY, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

This study initiated in 1953 and continues for 20 years, is a cooperative effort to determine rates and character of erosion, runoff, and sedimentation at different storm intensities and under different desert vegetation cover conditions, both grazed and ungrazed; and to determine influence of small animals on watershed.

Geological Survey is responsible for installation and maintenance of precipitation gages and water stage recorders. Sediment yield from the drainage basins is calculated from periodic measurements of the reservoirs. Gully erosion and sheet erosion are measured.

Responsibility for vegetative surveys using transect clusters, infiltration, and soils studies formerly conducted by the Forest Service is being assumed by the Geological Survey in the 1968 FY. The studies will include more detailed measuring procedures.

The Bureau of Land Management constructs and maintains all physical structures such as retention dams, check dams, diversion dams, ditches exclosures, etc. The Bureau of Reclamation reimburses BLM for portions of this work.

The Bureau of Sport Fisheries and Wildlife is studying small animal populations and the influence their activities have on vegetation and soil.

The study site is located in western Colorado, 4 miles east of the Colo-Utah boundary and 30 miles northwest of Grand Junction, Colorado

2.0177, SAN ISIDRO WASH STUDY FLOW LOSSES IN AN EPHEMERAL STREAM CHANNEL

R.F. HADLEY, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

Many of the ephemeral streams in Western United States experience a depletion of surface flow in a downstream direction as a result of infiltration in the dry channel bed.

The objective of this study is to determine, quantitatively, the flow 'losses' on San Isidro Wash near Cuba, New Mexico. This includes determination of whether the infiltrated water reaches an aquifer or is returned to the atmosphere by evapotranspiration; also, the changes in channel geometry that take place with flow losses and changes in sediment concentration. When conservation structures, such as detention reservoirs, are constructed in the basin and land treatment practices are initiated, the hydrologic effects of these practices will be studied.

Gaging stations have been established, channel cross sections have been surveyed, and scour chains have been installed to study channel changes. Precipitation and fluctuations of groundwater level also are being observed. Soil samples of soil-moisture determinations are taken to study the unsaturated zone.

2.0178, FLOW LOSSES IN AN EPHEMERAL STREAM CHANNEL

R.F. HADLEY, U.S. Dept. of Interior, Geological Survey, Denver, Colorado

Many of the ephemeral streams in Western United States experience a depletion of surface flow in a downstream direction as a result of infiltration in the dry channel bed.

Objective of this study is to determine quantitatively the flow 'losses' on San Isidro Wash near Cuba, New Mexico; and if the infiltrated water reaches an aquifer or is returned to the atmosphere by evapotranspiration. Also, what changes in channel geometry take place with flow losses and changes in sediment concentration. When conservation structures, such as detention reservoirs, are constructed in the basin and land treatment practices are initiated, the hydrologic effects of these practices will be studied.

Gaging stations have been established, channel cross sections have been surveyed, and scour chains have been installed to study channel changes. Precipitation and fluctuations of groundwater level also are being observed. Soil samples for soil-moisture determinations are taken to study the unsaturated zone.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0179, THE RELATION OF DRAINAGE NETWORKS AND BASIN DEVELOPMENT TO ROCK TYPE AND CLIMATE

R.F. HADLEY, U.S. Dept. of Interior, Geological Survey, Denver, Colorado

The objectives of this project are to related the processes of slope formation and drainage basin development to the rock type and climate over a wide range of conditions over the United States. Specifically, the following items will be investigated as an approach to the problem: (1) Determination of the validity of the statement made by humid regions, (2) Which expression of drainage density or topographic texture is a true reflection of hydrologic conditions for different climates, (3) To determine the processes and rates of basin development as affected by differences in climate. These may include frequency of freeze and thaw, mean annual precipitation, and microclimate; (4) Observations of slope processes and overland flow, such as, soil creep, rilling, and sheet flow in basins representing a wide range of rock types and vegetational covers; and (5) testing of the accuracy of measuring techniques of drainage density using topographic maps and aerial photographs supplemented by field mapping.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0180, A TEST OF CERTAIN EVALUATION DESIGNS FOR CLOUD-SEEDING EXPERIMENTS

W.E. HOWELL, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The proposed work is designed to test an idea, first proposed by G.P. Wadsworth that if a contour map of precipitation depth from a given storm can be satisfactorily approximated by a simple geometrical surface, then any local artificial influences will show up as significant departure from this surface. As a first approximation, a geometrical plane is fitted by least squares to the precipitation contours of a control area that surrounds the target and an estimate of the target precipitation is obtained by extending the actual target precipitation and a suitable test-variate is used to estimate the probability that the observed difference could be expected by chance alone.

The above model was tested on actual unseeded precipitation data from the Washita River Network located in central Oklahoma. Corresponding upper wind data were used to determine hypothetical seeding plumes for any given storm. Stochastic augmentation of target rainfall was used to determine the power of the method in detecting real seeding increases and the investigation covered other such subjects as transformation and normalization of precipitation data, the development of a suitable test-variate, and the sizes and shapes of applicable target and control regions.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0181, MECHANISMS AND RATES OF HEAVY METAL SORPTION AND DESORPTION

E.A. JENNE, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

The principle objective is the elucidation of the mechanisms and processes whereby manganese and iron oxides sorb cobalt (and other heavy metals). An additional objective is the determination of the rates of cobalt sorption and the effect of the natural variables of pH, redox potential, competing cation, cobalt concentration, etc. on the sorption rates.

Reaction kinetics, reversibility of sorption, and new phase formation are being utilized in determining the mechanism of the sorption reactions.

Sorption mechanisms and rates will allow a semi-quantitative description of the concentration of cobalt (and other heavy metals) in waters.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0182, SPECIFIC YIELD INVESTIGATION

A.I. JOHNSON, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

Methods of estimating the specific yield of aquifers will be studied in an attempt to obtain improved estimates of the water resources of ground-water basins and water use by phreatophytes.

The principle field and laboratory methods of estimating specific yield and the quantity of drainage as related to time of drainage are being investigated, evaluated, and correlated. Column drainage, centrifuge, moisture tension, and unsaturated permeability techniques will be emphasized in the laboratory, and moisture-content sampling and nuclear soil moisture-density logging in the dewatered zone will be emphasized in the field. Field work is done at selected sites in California.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0183, PERMEABILITY RESEARCH

A.I. JOHNSON, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

This study will determine and evaluate the factors involved in saturated and unsaturated fluid flow through porous media and would lead to more accurate and reliable analytical methods for the hydrologic evaluation of ground-water systems. The principal methods now commonly in use for estimating permeability will be compared and evaluated - these are laboratory methods utilizing permeameters and field methods utilizing pumping or flowing

2. WATER CYCLE

wells - any additional methods will be investigated as proved advisable.

2.0184, HYDROLOGIC BEHAVIOR OF SELECTED WATERSHEDS IN THE NORTHERN APPALACHIAN REGION

E.B. JONES, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Develop a procedure for predicting hydrologic behavior of watersheds in the northern Appalachian region including the impact of the application of precipitation modification techniques.

Representative watershed will be selected and certain existing simulation techniques will be utilized, (being modified as necessary to better meet regional conditions). Once the simulation techniques have been finalized, the effect that weather modification might have on the streamflow will be studied for periods of low flow.

Watershed selection is currently in progress and two simulator techniques have been adapted to the local computer (IBM 360 Model 67).

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0185, GENERAL EVALUATION OF SOIL AND MOISTURE CONSERVATION TREATMENT PRACTICES

N.J. KING, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

The objective is to appraise the effectiveness of structures on streams, waterspreaders, and other measures in the Western States. The effectiveness of the measures employed are evaluated particularly with respect to runoff, erosion, and sedimentation.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0186, ARIZONA WEATHER MODIFICATION ENGINEERING RESEARCH, ATMOSPHERIC WATER RESOURCES

P. MACCREADY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

To perform certain procedures and techniques in the general vicinity of Flagstaff, Arizona, to develop operational cloud nucleation methods with especial emphasis on major convective cloud systems and winter storm systems over a larger area.

Information will be obtained on ice crystal concentration, buoyancy effects, hydrometers, electrification, cloud system growth, etc. Work will also include quantitative engineering of the convective seeding techniques used, including design with respect to dispersal method, diffusion, and entrainment theories, with verification by field measurements. Exploration will be made of the effects of the San Francisco Mountains on cloud and precipitation patterns, during the summer and winter months. The establishment of a seedability climatology for summer and winter for the San Francisco Mountains will also be made. Applied Research 100 percent. The project was begun in FY65 and should be completed by the end of FY68.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0187, EVAPORATION FROM LAKES AND RESERVOIRS

J.S. MEYERS, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

The gross annual evaporation from exposed water surfaces has been estimated to be over 23,000,000 acre-feet for the 17 States lying wholly or partly west of the 100th meridian. If any of this annual evaporation loss could be reduced, an additional supply of water would be available to the arid West.

The objective of this study is the determination, by improved techniques, of variations in evaporation rates from representative lakes and reservoirs in the United States.

The energy-budget and mass-transfer methods of computing evapotranspiration are being compared for two large reservoirs: Garrison Reservoir in North Dakota and Pomme de Terre Reservoir in Missouri.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0188, ION DISTRIBUTION AND WATER MOVEMENT IN SOILS

R.F. MILLER, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

The objectives are (1) to define the relationship between water movement and ion distribution in soil profiles, (2) to evaluate the effect of cation exchange, and salt solubility on water movement, (3) to investigate the effect of water distribution in down drainage basins on ion distribution, soil-moisture relationships and plant distribution on arid lands.

In the past, emphasis has been placed on the effect of particle-size distribution (texture) on infiltration, runoff and erosion. The present study emphasizes the investigation of soil chemistry because it affects the swelling or shrinkage of soils and may have as great an effect on hydrologic characteristics as texture.

The soluble calcium plus magnesium and sodium distribution in consecutive portions of soil profiles with a variety of internal drainage conditions are being investigated with respect to evidences of water movement and moisture-storage characteristics such as moisture distribution, root distribution, soil structure and the nature of plant communities at equilibrium with these conditions. Other factors such as type of clay mineral, particle-size distribution and climatic factors are also evaluated.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0189, MATHEMATICAL METHODS OF EVALUATION OF RESULTS OF ATMOSPHERIC WATER RESOURCES PROGRAMS

H.J. MORELSEYTOUX, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The project has two primary objectives: (1) the determination of criteria for selection of river basins in Central Mountains Region of the United States suitable for weather modification with a maximum chance of success and (2) the design of statistical techniques or tests to detect weather modification attainments with reliability.

To achieve these above objectives two additional accessory, but vital, studies are conducted: (a) a study of the change in the relationship between meteorologic, hydrologic and physiographic parameters of a basin for a given weather modification process and mode of operation (e.g., cloud seedings from ground-based generators) and (b) a study of the nature and magnitude of errors in the measurement and collection of data.

2.0191, GROWTH SUPPRESSION AND REDUCTION IN REGROWTH POTENTIAL OF AQUATIC WEEDS

N.E. OTTO, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Successful continued control or eradication of rooted submersed aquatic weeds requires information on methods to reduce or eliminate the regrowth potential of the aquatic plant to a point where they produce insignificant problems. Studies have been conducted to gain a better understanding of organism ability to reproduce itself in subsequent growing seasons. These studies include influence of treatment on stage of growth, number and type of herbicide applications necessary to reduce the amount of vegetative growth and propagule development, amount of propagative material produced by a clone of plants and food reserves in the propagule.

2. WATER CYCLE

Laboratory investigations show that pondweeds treated with repeated aromatic solvent and acrolein applications in one growing season significantly reduced vegetative propagule production. A significant reduction in number and size of propagules was accomplished in successive treatments. Preliminary studies on the development of vegetative propagules of sago pondweed indicate that they commence development with the onset of plant flowering and fruiting. Continuing laboratory and field studies suggest that low rate, long contract period applications of a number of aquatic herbicides show promise on significantly suppressing the growth of rooted aquatic weeds, thus reducing potential residue hazards as well as controlling weed growth.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0192, DENVER MULTIPHASE FLOW

E.S. SAMMEL, U.S. Dept. of Interior, Geological Survey, *Denver, Colorado*

From an earlier survey and evaluation of theory applicable to flow in the unsaturated zone it appears that the principal needs are for procedures to predict unsaturated flow and methods for obtaining field measurements of the hydraulic properties of the unsaturated zone. Thus electric analog computing techniques will be devised for calculating unsaturated flow for specific boundary conditions, such as rate of infiltration, depth to the water table, and nature of the unsaturated sediments. Instrumentation involving electronic transducers will be applied for obtaining the desired field measurements. Theoretical results will be tested through field measurements.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0193, CONVECTIVE CLOUD SYSTEMS, NORTHERN GREAT PLAINS, ATMOSPHERIC WATER RESOURCES

R.A. SCHLEUSENER, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The program is designed to study the characteristics of both warm cloud and cold cloud convective systems with a view in mind of increasing the natural occurring precipitation from such systems by the introduction of artificial nuclei, since a major portion of the water supply of the Great Plains area comes from convective systems. Climatological studies, numerical model studies (as an attempt to simulate the natural growth of cumulus clouds), cumulus cloud penetrations by instrumented aircraft, and randomized seeding experiments will be made.

Cloud physics studies will be conducted with instrumented aircraft and radar aimed at determining the presence or absence of natural ice pellets in the convective clouds of the area. A systematic cloud census in regions of high frequency of cumulus cloud formation will also be conducted. Applied Research 100 percent. The project was begun in FY65.

2.0194, DEVELOPMENT OF ATMOSPHERIC LASER RADAR

R.M. SCHOTLAND, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The purpose of this research project is to develop a laser radar suitable for the study of the profile of atmospheric water vapor from a ground based location. The vertical distribution of water vapor is a basic parameter which enters all meteorological work and is of particular importance in the field of weather modification. The major problem areas are: (1) the design of a high energy switched ruby laser which is mode controlled and tunable, (2) the design of a receiving system which can handle a large dynamic range, (3) the design of data handling equipment which can reduce the radar return to atmospheric moisture content.

The design of the laser system is being based upon a saturable Q switch element operating in conjunction with a tunable resonant reflector. The receiving system will be designed about a 10 cassegrain telescope which will feed an s-20 photo-multiplier tube. A 30 mhz log amplifier will be used to cover the dynamic range of the optical return and to obtain the water vapor density function.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0195, STATE OF WASHINGTON DEPARTMENT OF WATER RESOURCES CASCADE ATMOSPHERIC WATER RESOURCES PROGRAM

S.E. SHUMWAY, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

This program is designed to develop reliable cloud treatment techniques and reproducible engineering procedures to accomplish a beneficial redistribution of precipitation across the Cascade Mountains to bolster the water resource in the arid intermountain region of the east.

Field experiments in cloud physics are being conducted in an area straddling the divide and centered around Snoqualmie Pass. Artificial nucleation practices are applied to the numerous wintertime Pacific Coast storms crossing this region during the months of October through April.

Cloud seeding operations are systematically employed and quantitatively monitored to provide a classification of the modification potential for each precipitating event; said events to be characterized by measurable, concurrent, meteorological parameters.

Efforts are directed toward developing methods to utilize the latent heat release from supercooled clouds subjected to artificial glaciation near the Cascade crest to stimulate cloud buoyancy for the purpose of prolonging precipitation on the leeward side.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0196, ANALYTICAL METHODS - WATER CHEMISTRY

M.W. SKOUGSTAD, U.S. Dept. of Interior, Geological Survey, *Denver, Colorado*

Analytical methods and techniques for many constituents that are found in water, such as aluminum, the halogenides, zinc, nitrate, nitrite, selenium, and detergents and other pollutants, frequently require modifications and refinements before they can be adopted specifically for water analysis. Improvements in all analytical procedures, including special instruments and techniques, are necessary to meet the requirements of expanding research efforts in the field of water chemistry.

The work consists of evaluating the potential of a technique and refining it to the minute concentrations significant in water chemistry. Fundamental chemical methods are studied as well as methods employing specialized equipment and instrumentation, such as X-ray and emission spectroscopy, electrometric, flame photometric and chromatographic instruments.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0197, ENGINEERING DEVELOPMENT OF ICE NUCLEI DISPERSION SYSTEMS

R.L. STEELE, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Many ice nuclei dispersion systems are in field use today. Most are unsatisfactory for one reason or another, e.g., the required engineering development has not been done to render these systems simple and reliable. Performance under laboratory conditions is known in some cases. However, field performance is largely unknown. This program provides for the engineering development of simple, reliable and economical dispersion systems for ground and later aircraft use. Further, it will provide information for prediction of field performance of dispersion systems. Current and future field programs in Project Skywear demand ice nuclei generators ranging in capacity of 0.02 kg to possibly as high as 200 kg of effective nuclei per hour. Systems which are reliable with predictable actual performance are and will continue to be required.

To meet these needs, three separate, concurrent investigations are being carried out. These are: a) Coagulation in generator plumes as a design parameter, b) Development of low and medium output ground based manual/automatic dispersion systems, c) evaluation of existing aircraft generators and development of a new generator.

2. WATER CYCLE

The ice nuclei dispersion systems developed in the program will represent the latest technology in this important phase of current and future weather modification programs. The basic engineering and science for carrying out this work is known. This will be synthesized from the atmospheric sciences, engineering sciences and recent technological development in the aerospace and process industries.

2.0198, EXPERIMENTAL DESIGN & STATISTICAL EVALUATION OF WEATHER MODIFICATION EXPERIMENTS

P.J. STINSON, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The overall objective of the research program is to develop experimental design criteria and statistical methods to aid in the evaluation of atmospheric water resources programs. Specific objectives are as follows. 1. A critical evaluation of past weather modification experiments will be made. Special emphasis will be placed on the evaluation of research methodology, statistical techniques, and interpretation of findings to determine their suitability for a particular experiment or for general application. 2. Conduct analyses to determine the effect of individual parameters such as (a) treatment techniques, (b) terrain factors, and (c) weather conditions on the reliability and validity of the results of weather modification experiments. 3. Develop design criteria for field experiments with special consideration of the above named parameters. 4. Develop statistical computer programs and analytical techniques for evaluating and comparing a wide variety of weather modification experiments.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0199, EVALUATION OF PRECIPITATION MANAGEMENT PROGRAMS BY PRECIPITATION RATE MEASUREMENTS

G.E. STOUT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Objectives. The objectives are to undertake a study to define the applicability and limitations of rainfall rate measurements to enable verification and quantitative evaluation of cloud seeding activities on surface rainfall, and to determine the type and density of sampling required to apply such knowledge. a. Prepare a feasibility study to establish the potential applicability of utilizing rainfall rate measurements in cloud seeding evaluations, and to define further research approaches leading to more effective cloud seeding evaluations using rainfall rate measurements. b. Study of area-depth curves of average and enveloping rainfall rate to aid in the definition of spatial characteristics and to detect additional properties useful for precipitation modification evaluation. c. Study the feasibility of using time distribution and duration of rainfall rates as evaluation procedures for determining overall additional rainfall quantities resulting from cloud seeding and for determining rate of change of rain intensity with time under natural and seeded conditions.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0200, SKYWATER

A.B. SUPER, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Phase one, completed in September, 1966, defined a program for evaluating the downwind effects of cloud seeding when applied upwind to the orographic barrier of the Bridger Mountain Range (average ridge height 8500 ft ASL) in Montana. Limited operations from February through May, 1967 provided an assortment of data from a network of sites extending from Bozeman to Billings, Montana. The data included rate of snowfall from compressed scale weighing gauges with large aperture for high resolution thermograph traces, barograph traces, ice nuclei background count, and visual observations of ice deposits on the ridge line during the storms in the area.

Analysed data which display the periodic variation of snowfall intensity at each site have been interpreted in terms of a

precipitation vector which is defined as the horizontal speed and direction of the precipitation surges and/or intervening lulls. Some success has been achieved in isolating an orographic component of precipitation at some sites and in following the periodic variations in precipitation intensity through the network. Interpretation of the data in relation to surface, 700mb, and 500mb analysis has resulted in a rough typing of precipitation as related to fronts, troughs and upslope conditions. Thermograph traces and visual observations of ice deposits on the ridge indicate an abundance of supercooled water droplets in a temperature range in which silver iodide can be expected to be effective in nucleation.

Additional sites will be instrumented and measurements expanded to better define precipitation vectors. The classification of storm situations and their potential for seeding will be investigated in more detail. Background nuclei counts will be continued in the network using the NCAR type counter. Aircraft will be utilized for both atmospheric soundings and tracking plumes released from the Bridger ridge to gain a rough idea of diffusion characteristics. Actual weather modification will probably begin in the winter of 1968-69.

2.0201, HYDROLOGY OF LIMESTONE AND RELATED ROCKS

F.A. SWENSON, U.S. Dept. of Interior, Geological Survey, Denver, Colorado

The general objectives of this research project are: 1. Define the geologic and hydrologic parameters that control the movement and storage of water in limestone and related rocks. 2. Determine the importance of primary and secondary porosity and permeability in limestone and related rocks, and of folding, faulting, and jointing to the development of solution cavities and their enlargement. 3. Determine the spatial relationship of caverns and secondary porosity and permeability and relate these to structural, geomorphic and other factors. 4. Determine sources of acid which may be instrumental in solution of limestone and related rocks. 5. Develop instruments and techniques needed to get answers to the numerous questions which remain to be solved regarding hydrology of limestone and related rocks.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0202, HYDROLOGY OF ARKANSAS RIVER VALLEY, CANON CITY TO STATE LINE

O.J. TAYLOR, U.S. Dept. of Interior, Water Resources Division, Denver, Colorado

This research is part of the program of water resources investigations conducted by the U.S. Geological Survey in cooperation with the State of Colorado. The irrigation systems in the Arkansas Valley have grown haphazardly around surface supplies and storage. Irrigation supplies are largely derived from surface water that varies in amount appreciably with climatic conditions. The existing irrigation systems do not supply adequate amounts of water throughout the year to all irrigated lands. Water development projects in the valley have had little concern for a systematic evaluation of the total water supply.

This project involves (1) the measurement of the effects of the present water-management practices on the hydrologic regime, (2) determination of the relation between pumpage of ground water and streamflow, and (3) a study of the management changes that could increase the supply and improve the quality.

2.0203, PROJECT SKYWATER - NEW MEXICO

J.N. WASHICHEK, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Object of the snow survey program is the gathering of snow and precipitation data in the Jemez Mountain Range of New Mexico.

Eight snow courses, established prior to this project, will be read every ten days by manual methods. An additional band of 8

2. WATER CYCLE

snow courses and 8 precipitation gages will be installed along Highway 126 east of Cuba. This winter, these will also be measured manually.

A new type precipitation gage is being developed for this project. Instead of the dip stick or standard weighing methods, a load cell will be used. These stations can be readily converted to an automatic gage if desired.

One automatic telemetered station may be activated near the center of the sector. This station will have an automatic snow pillow sensor and an automatic precipitation gage. Telemetry will be to base station, located in the area.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.0204, PROJECT SKYWATER - COLORADO - STEAMBOAT SPRINGS

J.N. WASHICHEK, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Object of the snow survey program is to collect snow data on the Park Range. There are now 24 snow courses ranging in elevation from 6,750' to 10,700' that are being measured. Numerous methods are being employed. Manual methods, employing snow tubes and scales, automatic sensors (pillows), and precipitation gages.

Six automatic sensors are in operation. These utilize onsite recorders as well as radio telemetry to a base station in Steamboat Springs. The base station has a visual read out as well as paper punch tape.

The on-site recorder is a modified A-35, designed to operate 6 months without attendance. It up-dates every hour.

A transducer at the pillow converts the pressure to electrical resistance for measurement.

Several different type pillows and transducers will be employed to ascertain the most usable.

Standard precipitation gages that can be maintained at snow level are used and compared to other types of measurements. Precipitation cans with different size orifices will be checked.

Manual measurements are used as a cross check of all data.

2.0206, ATMOSPHERIC WATER RESOURCES RESEARCH

M.C. WILLIAMS, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

The program is designed to investigate increasing water supplies in the Southern Sierra Nevada mountains of California and related regions through weather modification. Weather modification projects have been conducted in the general area considered for a number of years with the result that the effectiveness of cloud seeding as a means for production of increases of water supply of the order of ten percent has been accepted. The current program is thus designed to provide an engineering approach to investigations of the atmospheric parameters and mechanisms involved in an effort to extend and improve existing techniques. The program is composed of a series of projects designed to cover a period of five years. Specific projects within the overall program deal with hydrologic aspects, summer cumulus potential, winter storm potentials, seeding dispersal effects, and program design. Instrumentation is dealt with as a part of the individual projects.

2.0207, ECONOMICS OF GROUNDWATER DEVELOPMENT IN THE HIGH PLAINS OF COLORADO

P.W. BARKLEY, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: 1. Evaluate on farm and off farm consequences of various patterns of ground water development in the High Plains region. 2. Examine effects of alternative economic criteria as aids in establishing an institutional framework for guiding or regulating ground water development.

Proposed Work: Field surveys will be conducted to determine adjustments occurring on individual farms as a result of ground water development. These individual farm adjustments will be aggregated to determine effects on communities in the High Plains area. Results of these two efforts will be used as an aid in exploring various institutional provisions for use in regulating development of this essentially stock resource.

SUPPORTED BY Colorado State Government

2.0208, DRYLAND SOIL MANAGEMENT

K.G. BRENGLE, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

1. To evaluate cropping systems, tillage practices and fertilizer use on dryland regions of Colorado. 2. To study soil-water-plant interactions, including evapotranspiration, in relation to yield and quality of dryland crops. 3. To study the effect of soil management practices on the soil properties affecting wind and water erosion in Colorado.

Field and controlled environment experiments will be conducted to study various aspects of dryland soil management as related to crop production. All experiments will be randomized and replicated.

Cropping sequence-fertilizer-tillage experiments will study the effect of these variables on crop production, water utilization and runoff, and soil properties affecting wind erosion.

Water use efficiency and fertilizer response will be studied in relation to yield and quality of crops.

Crop yields and soil moisture storage will be related to methods and timeliness of tillage in the fallow period, chemical evaporation retardants and precipitation.

2.0209, DIFFUSION OF ENTRAPPED GASES IN POROUS MEDIA

A.T. COREY, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Entrapped air can have an effect on several significant properties of porous media which (except for the entrapped air) are fully saturated with a liquid. Two of the most significant properties affected are permeability to liquid and compressibility of the bulk medium.

Two ways in which gas may become trapped are (1) by a liquid moving into an originally gas-filled medium and isolating some of the gas and (2) by gas coming out of solution in an originally fully saturated system to form gas pockets.

Among the situations in which entrapped gas may be significant are: (1) the invasion of a pocket of natural gas by surrounding brine in an aquifer when a well is installed to recover the gas, (2) seepage from an irrigation canal, especially in the period shortly after water has been turned into a dry canal, (3) the consolidation of partially saturated compressible soils under loading, (4) infiltration of precipitation or irrigation water into soil, (5) cavitation in the conducting vessels of plants during rapid transpiration, among other physiological processes in living organisms.

The objectives of this research are: A. To study the process whereby a gas in isolated pockets (surrounded by liquid) diffuses from porous media under the influence of interfacial energy. B. To develop and to test equations describing the rate of diffusion of entrapped gas from porous media.

2. WATER CYCLE

SUPPORTED BY U.S. National Science Foundation

2.0210, INFLUENCE OF IRRIGATION PRACTICES

R.E. DANIELSON, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

To determine effect of methods of: application of irrigation water on moisture distribution, surface crusting, and plant emergence and growth; and, land preparation for irrigation and effect of subsequent tillage operations on soil tilth.

Description of Work: Field plots are used to evaluate the influence of soil structure deteriorating cultural practices on the growth and yield of various agronomic crops. Other factors affecting the crop are maintained as nearly uniform as possible. Soil physical measurements are made in an attempt to relate the physical status of the soil with plant response.

Laboratory investigations, pertaining to the ability of the plant to elongate its root system in a rigid system of given pore size, are included.

SUPPORTED BY U.S. Dept. of Agriculture
Colorado State Government

2.0211, WATER-SOIL-PLANT RELATIONS

R.E. DANIELSON, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: A. Investigate relationships between water stress in root medium and internal water status of plants as affected by environment and plant development.

B. Determine effect of plant-water stress and nutrients on morphology and metabolic processes determining growth and composition of plants.

Work Proposed: Plants will be grown under uniform and controlled conditions of environment until the desired vegetative growth has been obtained, at which time the water status of the plant tissue will be changed either by changing the water intake of the root system or by changing the evaporative potential of the foliar environment or both. Changes in the water intake by the root system will be obtained by using such methods as alterations in temperature, osmotic pressure, soil moisture suction, or carbon dioxide pressures. The evaporative potential of the foliar environment will be altered by changes in temperature, air movement, humidity, or light.

The water status of the plant tissue will be measured by one or more of the methods already developed or by new techniques developed as the investigation proceeds. The growth responses of the plant to the varied conditions under which it will be exposed will be measured. Such responses as rate of transpiration, net CO₂ assimilation, dry weight increase, and concentration of simple sugars in the plant tissue will be evaluated.

Colorado State Government

2.0212, FACTORS INFLUENCING THE FLOW OF SUB-SOIL WATER IN THE IMMEDIATE PROXIMITY OF, AND INTO DRAINAGE FACILITIES

N.A. EVANS, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: To analyze and describe the sub-surface flow of water and those factors which affect it in the immediate vicinity of the drain facility (tile line, ditch, drain well, etc.) for the preparation of improved criteria and procedures for design, installation and operation of drains.

Description: A full scale drainage model constructed at California under W-65 will be utilized to provide measured variables pertinent to flow toward a drain tile. The soil of the tank will be analysed to determine pore-size distribution and characteristic functional relationships between capillary pressure, saturation and permeability. A synthetic medium will be sought which will provide similitude as a model. The model behavior will be finally compared to the California model.

SUPPORTED BY U.S. Dept. of Agriculture
Colorado State Government

2.0213, MICROBIOLOGICAL ADSORPTION IN SOILS

N.A. EVANS, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

1. Investigation of factors affecting biological quality changes in water percolating through soils. Electrokinetic characterization of numerous media and micro-biological materials are made. Adsorption isotherms under both static and dynamic conditions will be measured and compared with theoretical isotherms developed from electrokinetic studies.

SUPPORTED BY Colorado State Government

2.0214, EFFECTS OF EARLY WATER ON WATERFOWL PRODUCTION

F.A. GLOVER, Colorado State University, Graduate School, Fort Collins, Colorado 80521

Waterfowl nesting and brood observations on the Monte Vista National Wildlife Refuge, correlated with records on water availability suggest that high waterfowl production occurs when water is available abundantly before the spring migration. This research project was designed to determine (1) what effect the application of water to a breeding area prior to the normal irrigation season will have on waterfowl production; (2) the cost-benefit ratio of an area that is supplied early water from supplemental sources as compared to an area which receives a normal supply of water during the regular irrigation season; and (3) the progress of ecological succession on the study areas during the course of the study and its effects on waterfowl production and use. The research is being conducted on two study areas on unit 6 of the Monte Vista National Wildlife Refuge in the San Luis Valley in south central Colorado.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

2.0215, HYDRAULICS OF SURFACE IRRIGATION

D.F. HEERMANN, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: To provide fundamental surface irrigation design understanding through the investigation of the hydraulic characteristics of surface flow: 1. By laboratory experiments to control certain variables in order to obtain relationships between variables. 2. By field investigations to test validity of mathematical equations and laboratory relationships.

Description: Field data will be collected on flow resistance in irrigation furrows from many sites covering a wide range of site and soil conditions. Application of spectral density analysis and similar new ideas to characterize roughness will be made. Flow mechanics thus formulated will be related to application efficiency.

Colorado State Government

2.0216, EVAPORATION FROM SOIL SURFACES AS AFFECTED BY SALT, STRUCTURE AND TEXTURE

W.D. KEMPER, Colorado State University, School of Agriculture, Fort Collins, Colorado 80521

Theory and equations governing the movement of water in response to salt concentration gradients in soils will be developed. Studies will be set up to test these theories and equations and to determine the portions of the water movement which are in the liquid and vapor phases.

The practical significance of this osmotic movement on evaporation will be studied. Reduction of the thickness of the dry layer of soil (which prevents liquid flow) is predicted when appreciable amounts of salt are in the soil profile. This prediction will be tested and equations, amenable to computer solution, will be developed from which quantitative predictions can be made.

2. WATER CYCLE

Colorado State University

2.0217, PREDICTION OF WATER MOVEMENT IN UN-SATURATED SOILS

W.D. KEMPER, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: 3. To delineate the influence of structure and electrostatic differences as well as solute concentration and energy gradients upon the movement of solutes, energy and water in soils and clays.

4. To devise quantitative expressions describing the simultaneous movement of water and solutes and energy in soil.

Procedures: Restriction coefficients of ions which determine the degree to which salts move water, will be determined in clay and soil systems. Effects of the electrostatic and geometrical properties of soil on these restriction coefficients will be determined from both experiment and theory. The mechanisms involved in the simultaneous flow of water, solutes, and energy will be delineated. The understanding of these mechanisms will be used in the development of thermodynamic equations valid for such simultaneous flow.

SUPPORTED BY U.S. Dept. of Agriculture

2.0218, HYDROMETEOROLOGY

W.E. MARLATT, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

A. To investigate the wind structure on the high mountains.
B. To investigate the actual occurrence of precipitation and the arrangements of precipitating clouds in relation to the mountains.

Description of Work: Initial work is concentrated on the period of winter build up of snow pack. Detailed observations of wind and temperature will be obtained from the top of one of the high mountain peaks during the winter to determine the turbulence structure of the atmosphere's function of wind speed and durations.

SUPPORTED BY Colorado State Government

2.0219, A SYSTEMATIC TREATMENT OF THE PROBLEM OF INFILTRATION

H.J. MORELSEYTOUX, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The overall objective of the research is to develop a mathematical model of infiltration capable of responding to any spatial and temporal pattern of rainfall or its lack. In this form the model would be readily capable of integration into a general model simulating the hydrologic response of a watershed.

In a first phase the objectives will be more limited. In essence the two principal objectives are: (1) The development of a one dimensional model of water infiltration into a soil column under realistic conditions of varying water supply at the surface, non-uniform initial moisture conditions, heterogeneous soil characteristics and the effect of hysteresis, and (2) The development of a less general two-dimensional model of water infiltration to model primarily the influence of spatial variation of the available water supply on infiltration.

2.0220, WIND EFFECTS ON THE DISPERSION OF PARTICULATE POLLUTANTS IN TURBULENT OPEN-CHANNEL FLOW

E.J. PLATE, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

This is a study of the dispersion of solid particles in a liquid stream. The flow in the stream is turbulent with a free surface. Air is blown across the free surface in such a manner as to create waves in the water and thus to simulate the turbulence generated by wind over streams. A quantitative understanding is sought

through experimentation for the effect of wind on the diffusion of particles in the water.

The results should lead to data which can be used in the solution of the diffusion equation in open channel flow with and without wind. A measure of the increase due to wind in diffusivity can be obtained in this way. The effect of wind on oxygen absorption in the stream is also to be investigated.

SUPPORTED BY U.S. National Science Foundation

2.0221, STRATTON SAGEBRUSH HYDROLOGY STUDY

R. PRICE, Colorado State University, U.S.D.A. Rky. Mtn. For. & Rge., Fort Collins, Colorado 80521

Objectives: To determine quantities and rates of runoff from rainfall and snowmelt, sediment movement and production, soil moisture regimes, sagebrush effects on snow accumulation of storage, etc., from watersheds in natural stands of big sagebrush and after treatment to eliminate sagebrush by chemical spraying; and to obtain other data necessary for the determination of hydrologic soil-cover complex numbers from sagebrush sites before and after treatment.

Procedures: Five small watersheds (100 or more each) will be selected within the big sagebrush vegetative type, representative of similar areas on which brush conversion by chemical treatment is a standard procedure. Each will be instrumented for climatic data, runoff and sediment yields, soil moisture and temperatures, etc. Detailed soil and vegetation samplings and measurements will be made. When satisfactory calibration has been obtained, one or more watersheds will be treated by chemical spraying and the studies will be continued until the effects can be determined.

Colorado State University

2.0223, ATMOSPHERIC WATER

J.R. RASMUSSEN, Colorado State University, Natural Resources Center, Fort Collins, Colorado 80521

Nearly all of the runoff into the Colorado River for the principal water supply of the Southwestern United States comes from precipitation in form of winter snowfall over a very small fraction of the watershed area at high altitudes. Even there, however, runoff is only 50 percent and the other 50 percent of the snowpack evaporates, partly by windblowing of the snow over the expanse of tundra above timberline. If the wind driven snow could, in part, be channelled into now vacant glacial cirques east of the high ranges, it would be stored in depth at locations where exposure to sunshine is minimal. Even a moderately successful channelling scheme would greatly increase the available water supply, especially for the badly needed late season water delivery.

Feasibility studies for such channelling are underway in the laboratory and on a mountain in central Colorado, where experimental fencing designs have been erected for a preliminary look in the 1965-66 winter. A more elaborate experiment is planned for the succeeding winter.

2.0224, REAERATION IN OPEN CHANNEL FLOW

W.W. SAYRE, Colorado State University, U.S.D.I. Water Rsour. Div., Fort Collins, Colorado 80521

2. WATER CYCLE

The capacity of a body of flowing water for assimilating biodegradable wastes depends heavily on the supply of dissolved oxygen which is required for the decomposition of organic material by bacteria. The amount of oxygen available for this purpose in turn depends on a complex balance among a number of processes which include various sources and sinks, and also the inflow and outflow of dissolved oxygen by convection. The principal sources augmenting the dissolved oxygen supply are atmospheric reaeration, and photosynthetic production by aquatic organisms mainly green plants. Typical sinks depleting the supply, some of which are due to man-made pollution, are respiration of bacteria and algae, benthic deposits, and chemical oxidation.

The oxygen balance can be described qualitatively by a fundamental continuity equation. Before this equation can be used with confidence for predictive purposes, however, much remains to be learned about the source and sink processes, how they relate to one another, and how they relate to measurable physical and biochemical characteristics of a stream system.

This project is concerned with investigating the reaeration process in open channel flow, with particular emphasis on natural surface reaeration. Although no fundamental research on the biochemical processes involved in the oxygen balance is contemplated, they must be accounted for.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0225, STABLE ALLUVIAL CHANNELS

H.W. SHEN, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The proposed research is an analytical and experimental study of alluvial channels. The objectives are to study: 1. The shear distribution on the rigid boundary of channels with different cross section shapes. 2. The ultimate stable cross section shapes of alluvial channels under different hydraulic conditions and sediment sizes without sediment inflow based on the variation of shear distributions along the boundary. 3. The effects of sediment load, seepage force and flood plain material on the ultimate stable channel cross section. 4. The application of the results obtained from laboratory studies to explain the fluvial morphology of rivers.

SUPPORTED BY U.S. National Science Foundation

2.0226, EFFECTS OF FIRE ON HYDROLOGY AND EROSION

W.D. STRIFFLER, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: 1.) to determine the amount and timing of downslope soil and ash movement. 2.) to determine the effects upon the physical and chemical characteristics of the soil. 3.) to determine the effects upon the hydrologic characteristics of the slope. 4.) to establish a series of permanent sample plots for an evaluation of vegetative re-establishment.

Procedures: A series of plots will be established within and adjacent to the burn area with plots located at upper, middle, and lower slope positions. Measurements to be taken at each plot will include soil loss, soil moisture, infiltration rates, and soil samples for physical and chemical analysis. Analysis will primarily be a comparison of measured properties between burned and unburned plots by slope positions. In addition sediment measurements will be taken during storm runoff periods from a small stream flowing through the burned area.

2.0227, LAMINAR AND TURBULENT FLOW OF FLUIDS THROUGH POROUS MEDIA

D.K. SUNADA, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The proposed study will be devoted to the development and verification of a general theory describing compressible and incompressible fluid motion in porous media. The theory will be based upon an analysis of the classical Navier-Stokes equations for fluid motion and upon considerations of energy dissipation due to laminar and turbulent action. The physical parameters of

the porous medium which affect the flow phenomena will be analyzed by statistical methods and correlated with hydraulically measurable quantities.

2.0228, THE EFFECT OF VARIOUS COMMERCIAL FERTILIZER PLACEMENTS AND IRRIGATION PRACTICES ON THE YIELD AND QUALITY OF RUSSET BURBANK POTATOES

J.G. WALKER, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Objectives: 1. Compare various combinations of fertilizer placements and irrigation on optimum yield and quality. 2. Determine the effect of treatments on nitrate-nitrogen movement, moisture distribution, temperature on the uptake of N and P by the potato plant.

Procedure and Description: The study will be undertaken in San Luis Valley of Central Colorado. Fertilizer treatments will be banded at planting time 4' wide beside or below seed piece with irrigations made on every furrow or every other furrow for comparisons. Tensiometers and thermograph recordings will be made. Soil and leaf samples will be correlated to determine amount of N and P. Soil profiles will be developed as part of this study.

2.0229, GEOHYDRAULICS AT THE UNCONFORMITY BETWEEN BEDROCK AND ALLUVIAL AQUIFERS

J.P. WALTZ, Colorado State University, Graduate School, Fort Collins, Colorado 80521

The proposed research is to develop principles and methods for estimation of water transfer at bedrock-alluvium contacts in groundwater basins.

Fundamental to the concept of an alluvial basin is the isolation of water. That is, neither surface water nor groundwater should flow from one basin to another. If groundwater basins can be designated such that water transfer is minimized, then it is feasible to determine availability of water in each basin and to develop laws and management policies for water use.

Three designated groundwater basins in Colorado will be studied to determine the magnitude of water flux into or out of the underlying bedrock. Considerable data are available on bedrock and water level elevations within each of the three basins.

Procedures for the study will include: use of digital computer models and trend surface analyses, piezometric studies in both bedrock and alluvial aquifers, and general geologic and geophysical techniques.

2.0230, SEDIMENT PRODUCTION, YIELD, & DELIVERY RATIO IN RELATION TO CLIMATIC, GEOLOGIC, & WATERSHED CHARACTERISTICS OF THE NORTHERN PLAINS

D.A. WOOLHISER, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: To develop procedures for predicting the sources, amount, and rate of gross erosion; character of sediment yield; and delivery from agricultural watersheds of varying sizes in principal physiographic and climatic regions.

Plan of Work: Information on quantities of sediments carried by streams is obtained by means of reservoir sedimentation surveys and through suspended load sampling on selected watersheds. Records of precipitation, runoff, topography, channel characteristics, soils and geology, land use, conservation practices, and watershed treatment measures are compiled for the areas for which sediment yield records are available. Studies are made to determine and evaluate the processes and rates of erosion on land surfaces including gullies, roadbanks, and stream channels. Radioactive elements and other tracers are used in a studying the movement of sediment from erosional sources to points of deposition. Required instrumentation is developed. Data on sediment yield rates and associated casual factors are analyzed

2. WATER CYCLE

and interpreted to derive improved techniques and equations for estimating sediment yield and sources in ungaged watersheds.

2.0231, FLOODS FROM SMALL WATERSHEDS

V.M. YEVDJEVICH, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The flood response of rural watersheds within the size range of one-fifth to fifty square miles distributed throughout the United States is being studied. Three complementary approaches are to be pursued simultaneously. Systems investigations will be undertaken with theoretical conditions involving rainfall as input and runoff as output. Hydrodynamic prototypes will be investigated by applying artificial rain to a one-to-two acre outdoor facility. Provisional results from both of these will be checked against, and appraised in the light of, storm and flood events observed in nature on many experimental and other watersheds. This latter data assembly, which is already underway, will itself facilitate statistical and hydrological analyses of natural basin response. July 1965 is the starting date for the five year program.

Colorado State University

2.0232, EXPERIMENTAL INVESTIGATION OF SMALL WATERSHED FLOODS

V.M. YEVDJEVICH, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Project Objectives: The design, construction and operation of a rainfall-runoff experimental facility, one acre in size, for the purpose of observing prototype-scale response of a watershed under controlled conditions. The general objectives are to increase the understanding of processes making up watershed response and to improve our ability to apply knowledge of the processes to the estimation of the response of real watersheds.

Work Description: The work proposed for the Rainfall-Runoff Experimental Facility is as follows. 1. Design and construction of the facility including site preparation, water supply system, runoff measuring system and rainfall simulators. 2. Experimental program of rainfall-runoff pattern studies for a given range of precipitation intensities.

SUPPORTED BY Colorado State Government

2.0233, PHASE TWO - EXPERIMENTAL INVESTIGATION OF SMALL WATERSHED FLOODS

V.M. YEVDJEVICH, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

For Phase Two, the principle effort will include the completion of the rainfall-runoff experimental facility, and the testing of the facility to determine its operating characteristics and refining the design of the more critical components to provide more uniform conditions or more flexible operations if such appears appropriate. Initial test data will be used for some comparison studies with mathematical models. In particular, an evaluation will be made of the mathematical description of convergent overland flow on conical shaped catchments. An objective of this proposed research effort will be the completion of preliminary studies on some simple conceptual models to the point that some significant conclusion will be justified with respect to non linearities in the response of the total catchment or its component parts to rainfall.

2.0234, SAN LUIS WATERSHED STUDY

E.F. ALDON, U.S. Dept. of Agriculture, Rocky Mtn. For. & Rg. Ex. Sta., Fort Collins, Colorado

Three small watersheds, about 58 miles NW of Albuquerque, New Mexico, of comparable size (WS I, 555 acres; WS II, 471 acres; WS III, 338 acres) and similar topographic, edaphic and climatic conditions have been investigated since 1952.

The primary objective of the study is to determine the effects of conservation and range management practices on the net yield

of water, sediment, and forage. Controlled grazing, ripping, fertilization, and seeding have been studied.

The present agreement has been made for the period of July 1, 1967 until June 30, 1978, with the same primary objectives.

The objectives for 1968 FY are: a. Determine the vegetation density, production, and utilization as affected by a mechanical treatment, grazing, and protection grazing. b. Determine germination requirements of native grass species. c. Study effects of fertilization on ground cover density of flood plains. d. Determine factors affecting seedling survival.

2.0236, MECHANICS OF FLOW STRUCTURE AND FLUID RESISTANCE

P.S. MCQUIVEY, U.S. Dept. of Interior, Water Resources Division, Fort Collins, Colorado

The objective of this study is the exploration and measurement of the internal flow field of turbulent shear flow in an open channel in order to obtain a fundamental understanding of the mechanics of fluid resistance and sediment transport.

The study is designed to answer the following questions: 1. What are the measures of turbulent characteristics which best describe the structure of turbulence? 2. How can these measures of turbulent characteristics best be measured in open channel flow? 3. Will the selected measures of the turbulent characteristics and measurement techniques be adequate to permit experimental verification of the equation of motion for steady uniform flow in an open channel? 4. How does the structure of turbulence vary with respect to distance from the boundary for steady uniform flow in a wide open channel? 5. How are the turbulent characteristics related to mean flow properties, fluid properties, and channel geometry? 6. What are the effects of the properties of suspended matter (density, concentration and size) on the turbulent characteristics of open channel flow? 7. How are the lagrangian and eulerian measures of turbulent characteristics related?

2.0238, MEADOW SOD MAT ACCUMULATION AND DECOMPOSITION

F.A. NORSTADT, U.S. Dept. of Agriculture, *Grand Junction, Colorado*

One project of mine deals with meadow sod mat accumulation and decomposition. Irrigated mountain meadows of Colorado build up a sod mat 2- to 15 cm thick depending on altitude and soil water content. I am studying physical, chemical, and biological factors which are thought to affect the accumulation and decomposition of the sod mats. I am using electronic probes to instrument sites in the meadows that represent wet, dry, and intermediate soil moisture conditions to measure temperature, redox potential, oxygen content, and pH. A neutron probe measures soil water content. These measurements are at 3 depths in the soil profile. We are plating soil samples from the 3 moisture sites to measure the number of bacteria, fungi, and denitrifiers at 3 depths in the soil. These physical, chemical, and biological parameters will guide design of laboratory experiments. In the laboratory I am studying the effect of temperature, water content, and fertilizer amendments on the decomposition of sods by the indigenous soil microorganisms. In the sod decomposition study the evolution of CO₂ is used as the index of mineralization of the carbon skeleton of the sod material.

2.0239, NUMERICAL SIMULATION OF THE MACROPHYSICAL AND MICROPHYSICAL PROCESSES OF MOIST CONVECTION

G. ARNASON, Travelers Research Center Inc., *Hartford, Connecticut*

BRIEF DESCRIPTION OF PROPOSED RESEARCH: The main objective of the proposed research is to simulate realistically by numerical methods the conditions within and in the immediate surroundings of a convective, non-freezing cloud. A secondary objective is to form an opinion as to the feasibility of artificially modifying such a cloud and in particular to assess at which stage of development the cloud is most sensitive to an external stimulus. To obtain the above objectives it is necessary to include both the macrophysical and microphysical processes known to be important to cloud development in an effort to study in considerable detail all the major phases of the evolution of a non-freezing cloud. To do that it will be necessary to specify a realistic initial state; take into account the dynamics of the situation, excluding friction but including shallow convection; use bulk thermodynamic equations; distinguish between the mixing ratio of the vapor and liquid phases of water; specify an initial droplet distribution; use growth of the droplets through condensation and coalescence processes; and take into account the evaporation of the rain. The numerical solutions will be obtained by solving the systems of equations by finite differences. A mesh of 100m and a grid of 1,000 points will be used. Computational schemes of Lax-Wendroff and Lilly will be used. It is anticipated that in two years it will be possible to formulate the problem and to prepare and check out the computer program. It is possible that within the time period results may be obtained that show a realistic simulation of all phases of cloud development.

2.0240, ESTIMATING RUNOFF RATES FROM SMALL RURAL WATERSHEDS

P. BOCK, Travelers Research Center Inc., *Hartford, Connecticut*

In the design of culverts, better hydrological procedures, productive of more reliable results, are needed for estimating runoff

from small rural watersheds. Reliable procedures will permit more confident selection of the flow to be accommodated and, with recent advances in hydraulic and structural design, should help to optimize the expenditures for drainage structures. Runoff information is being collected from selected small rural watersheds as well as information related to a better understanding of the phenomena involved in the generation of runoff from small drainage areas. A number of investigations have developed methods for synthetically determining maximum discharge and hydrograph definition in relation to the parameters exerting a major influence on runoff. With this background it now appears possible, by analyzing the information and interrelating functionally the major parameters affecting runoff, to develop computer programs, or other procedures, that will, upon definition of the various parameters involved, produce an estimate of the maximum discharges likely to occur from small rural watersheds for selected recurrence intervals. It is desired that the method developed will: (1) require only data that can be readily obtained by the designers, (2) use parameters and functional relationships which are logically justified, (3) take cognizance of differences due to geographical characteristics, and (4) present the information desired in a readily usable form.

2.0242, STUDY OF LIGHT ISOTOPES IN LACUSTRINE ENVIRONMENTS

M. STUIVER, Yale University, Graduate School, *New Haven, Connecticut* 06520 (AT)

Objective: To obtain information on the changes in oxygen isotope ratio of atmospheric precipitation during post-glacial times. This information is obtained by determining O18/O16 ratios of carbonates deposited in lakes. The variations in this ratio are caused, amongst others, by changes in O18 content of atmospheric precipitation that are associated with long-term changes in climate. Also proposed is the determination of O18/O16 ratio of marine shells from the 12,000 years old Maine marine invasion. These ratios will be influenced by the freshwater contributions of glacial run-off and might possibly provide information on the O18 content of the former ice-cap.

2.0243, RELATION OF BEDROCK FRACTURE SYSTEMS TO UNDERGROUND WATER IN STAFFORD SPRINGS, SOUTH COVENTRY, SPRING HILL & WESTFORD QUADS

J.M. AITKEN, Univ. of Connecticut, Graduate School, *Storrs, Connecticut* 06268

Fractures represent one of the easiest avenues of ingress for groundwater penetrating bedrock. Such fractures are a product of regional deformation. Expansion of present structural studies is proposed which would emphasize detailed analysis of fractures (orientation; frequency-in numbers and spacing; projection of zones of possible intersection of depth).

The data obtained would provide information pertinent to problems of potential supply, questions of a typical or excessive flow-and potential contamination. The work would serve as training in recognition of bedrock structure as a factor in controlling supply and quality of water.

2.0244, RATE AND DIRECTION OF GROUND WATER CIRCULATION IN CLOSE SPACED BEDROCK AND GRAVEL WELLS UNDER THE INFLUENCE OF NON-SYNCHRONOUS PUMPING TIME

L. FRANKEL, Univ. of Connecticut, Graduate School, Storrs, Connecticut 06268

Storrs, Connecticut is an urban area without a central water supply or sewage disposal facilities. Individual wells and septic tanks are utilized. With the gradual transformation of the area over the past twenty-five years from a rural community, with separation of homes by many acres, to an urban community with separation by less than 150 feet in many cases, has come the problem of well contamination.

Contamination has occurred in many situations where the topography, percolation indices, and hydraulic gradient are favorable to 'good' water and when there is separation of water supply and sewage disposal in accordance with state regulations. It is therefore suspected that contamination is the result of changes in the rate and direction of groundwater flow as the result of nonsynchronous and variable rates of pumping from closely spaced wells.

To test this hypothesis, well fields will be constructed and certain wells will be contaminated with nontoxic chemical and biological contaminants, and the rate and pattern of flow under natural conditions and pumping will be determined.

The end purpose of this project is to obtain data which might aid in determining before home construction occurs under what conditions (e.g., well depth, rate of pumping, distance of separation of water supply and sewage disposal) seemingly safe topographic and earth material situations can become areas of contaminant concentration.

2.0245, THE NATURE AND MAGNITUDE OF THE RESISTANCE TO FLOW OF WATER IN ROOTS

B.E. JANES, Univ. of Connecticut, School of Agriculture, Storrs, Connecticut 06268

This project is designed to obtain information needed to expand current theories on the nature and mechanics of water flow through semipermeable membranes of the root. Measurements will be made on the effect of (a) osmotic stress, (b) oxygen concentration, (c) temperature on transpiration of intact plants and exudation of decapitated roots.

SUPPORTED BY U.S. National Science Foundation

2.0246, EXPERIMENTAL STUDIES OF AIR AND WATER INTERFACIAL INTERACTION

J.D. LIN, Univ. of Connecticut, School of Engineering, Storrs, Connecticut 06268

The proposed research is an experimental study of the interaction on the air-water interface to be conducted in the Hydraulic Laboratory of Civil Engineering Department by utilizing most of the existing wind tunnel and instrumentation facilities. A test section, consisting of a wind tunnel over a channel of variable depth and of sufficient fetch, will be constructed for this investigation. The transient and equilibrium surface waves generated by various turbulent wind profiles with zero pressure gradient along the tunnel will be investigated. The turbulence in the wind and possibly in the water will be measured in addition to the mean quantities and the surface wave spectrum as previously studied by other investigators. The wind generated wave theories and previous experiments under somewhat different conditions will be examined. The correlation of experimental data among the wind, waves and water should provide a basic understanding and the mechanism of dispersion, mixing and perhaps diffusion of contaminated surface water or pollutant spreading over the surface of water under the action of turbulent wind.

University of Connecticut

2.0248, OXYGEN STATUS OF SOIL AIR AND SOIL WATER AS INFLUENCED BY OXYGEN TRANSFER THROUGH THE SOIL PROFILE

R.W. WENGEL, Univ. of Connecticut, School of Agriculture, Storrs, Connecticut 06268

The purpose of this research will be to investigate and define those factors affecting the diffusion and mass transfer of oxygen through the soil profile with particular emphasis on the resultant oxygen status of water moving laterally or downward toward the ground water system.

The factors to be investigated are: soil air-space porosity distribution over the soil moisture release characteristic, oxygen sink sources within the soil profile and their relative importance in oxygen consumption, and the mass transport of oxygen during infiltration.

Soil porosity and soil water will be determined using standard pressure plate and pressure membrane technique. Gaseous oxygen in the profile will be determined from diffusion chamber samples by gas chromatography. Dissolved oxygen will be determined by polarographic techniques on soil water samples during periods of saturation and by oxygen solubility calculations based on gas-liquid phase equilibria during periods of unsaturation.

The quantitative measurement of oxygen transfer and utilization in soil will have application in studies of: oxidation-reduction reactions in the lower soil profile, potential conditions for biological oxidation of soluble organic contaminants in soil water, and soil oxygen supply characteristics for subsurface oxidation of organic wastes such as those from small septic systems.

2.0249, FLOW OF A ROTATING FLUID OVER IRREGULAR SURFACE TOPOGRAPHIES

D.L. BOYER, Univ. of Delaware, School of Engineering, Newark, Delaware 19711

The objectives of this work are (1) to develop analytic solutions and (2) to conduct experimental investigations of the flow past arbitrarily shaped obstacles located on both the lower and the upper surfaces of two 'infinite' horizontal planes in a rapidly rotating system.

The necessary flow conditions can be realized experimentally by pumping fluid through a rapidly rotating rectangular channel whose horizontal dimension is large compared to the obstacle dimensions. A series of experiments will be conducted to establish a critical range of Reynolds and Rossby Numbers for which Taylor Columns are formed. An effort also will be made to determine the flow pattern for the various regimes of Reynolds and Rossby Numbers for which the phenomenon does not occur.

The physical systems will be investigated under two regimes, Ro/Re is less than 1, where Ekman type boundary layers occur along the solid boundaries and $(Ro/Re)^{1/2}$ is less than 1 where inertia terms may be neglected everywhere.

SUPPORTED BY U.S. National Science Foundation

2.0250, FLUSHING PATTERN OF CERTAIN TIDAL STREAMS IN DELAWARE

F.C. DAIBER, Univ. of Delaware, Graduate School, Newark, Delaware 19711

Our various biological and hydrographic investigations within the tidal creeks adjoining Delaware Bay over the past years point up the need for a more thorough knowledge of the circulation patterns and other hydrographic features within these tidal creeks. This information will identify the location and volume of fresh water during various tidal and seasonal conditions. Such information is of value in selecting sites and times for withdrawal of water for irrigation, farm and industrial usage. It has implications in terms of domestic and industrial pollution and health, transport of plant nutrients from coastal marshes and survival of eggs and larvae of fish and shellfish. This study could serve as a model for study of creeks of other sizes and magnitude of tributaries. This work is to begin in fiscal year 1967 and terminate at the end of fiscal year 1969.

2.0251, CLIMATE OF THE NORTHEAST - ANALYSES & RELATIONSHIP TO PLANT RESPONSE (NE-35)

D.J. FIELDHOUSE, Univ. of Delaware, Agricultural Experiment Sta., Newark, Delaware 19711

To analyze available meteorological data to determine frequency distributions of climatological variables and probabilities of occurrence of certain weather patterns likely to influence plant culture. Determine relationships between macro and micro climatic variables influential in crop production. Analyze records on crop response, spread of plant diseases, and severity of insect infestations and determine if relationships exist with available meteorological data. Determine by field observations, climate measurements and detailed experimentation direct influence of climate on plant growth, diseases, insect pests and efficiency of crop treatments.

Description of Work: To analyze the Delaware weather records according to procedures developed in the Northeast to determine heating degree days, growing degree days, drought probabilities and other similar analyses important to agriculture.

To determine the response of snap beans to variations in soil and air temperature and to the cultural practices such as irrigation, foliar sprays and mulches which affect these radiation dependent climatic variables.

2.0253, MORPHOLOGY AND HYDROLOGY OF PLEISTOCENE DEPOSITS, DELAWARE

J.J. GROOT, Univ. of Delaware, Graduate School, Newark, Delaware 19711

This project will: (1) attempt to determine ways by which Pleistocene buried channels can be detected and reconstructed in the Coastal Plain of Delaware, (2) determine the hydrologic characteristics of the channel sediments and the amount of ground-water pumping such channels will sustain.

Pleistocene stream channels are rather common in most areas of the country that bordered the former Pleistocene ice sheets. Where present, such channels are usually an excellent source of ground-water both from the standpoint of quantity and quality. Ordinary seismic and drilling techniques are generally quite successful in locating channel deposits in area of consolidated bedrock where the lithologic contrast between bedrock and channel sediments is great. However, in Coastal Plain areas, the channel deposits are similar in nature to the adjacent sediments and detection by any single means becomes quite difficult. Furthermore, no overall theory regarding channel formation and subsequent erosional modification guided previous attempts in locating channels. This study will use a combination of methods in locating channels based upon a theory of formation and erosional history recently worked out by one of the investigators.

A pilot area containing known Pleistocene channels will be studied in detail using drilling and resistivity techniques in the field. Extensive examination of core samples will be undertaken in the laboratory. Following field exploration, pump tests will be run to determine the potential ground-water yield of the channel system. The overall conclusions will be checked against the theory and the methods advised will finally be tested in other areas of the State.

2.0254, THE GROUND-WATER FLOW SYSTEM IN THE DELMARVA PENINSULA

R.D. VARRIN, Univ. of Delaware, Water Resources Center, Newark, Delaware 19711

This study has as its prime objective a thorough understanding of the ground-water flow system in the Delmarva Peninsula. The geological data on the properties and distribution of aquifers and non-aquifers have been summarized in cross-section form. The basic data on the factors of the water balance--evapotranspiration, water surplus, runoff, soil moisture storage--have been calculated from the analyses of more than 60 years of temperature and precipitation records from three representative stations on the peninsula. The water balance calculations and geologic data have been used as input information in the design and operation of analog models.

Two viscous-flow analog models have been constructed: (1) a vertical model to determine the nature of ground-water discharge to Delaware Bay; and (2) a horizontal model to determine the effect of pumping from multiple-aquifer wells. Based on the results of the viscous-flow analog tests and numerous field studies in Delaware, an electric analog model of the northern portion of the Delmarva Peninsula has been designed and constructed.

2.0255, STREAM VALLEY ASYMMETRY IN AN ARCTIC ENVIRONMENT-CONDITIONS GOVERNING GEOMORPHIC PROCESSES 7360

M.A. MELTON, Arctic Inst of North America, Washington, District of Columbia

The study is to investigate the geomorphology of the small west-trending valleys in high latitudes to establish (1) whether or not these valleys exhibit any consistent asymmetry in their valley-side slopes, and (2) whether any asymmetry is more the product of microclimatic differences across the valleys or is the result of the behavior of the stream. Field methods and sampling designs are expected to allow an objective estimate of the relative importance of the various controls on valley asymmetry, from which comparisons can be made with other climates in which stream valley asymmetry has been observed.

The investigation was conducted in a number of small east-west trending valleys in the Caribou Hills area, east of the MacKenzie River. Final analysis of data and synthesis has been accomplished at the University of British Columbia and the following final report has been submitted to the Army Research Office - Durham (Environmental Sciences Division), Box CM, Duke Station, Durham, N. C. 27706: 'Stream Valley Asymmetry in an Arctic-Subarctic Environment - Conditions Governing the Geomorphic Processes' by Barbara A. Kennedy and Mark A. Melton, 1 June 67 - 31 May 68.

2.0256, A STUDY OF TECHNOLOGIES FOR REDUCING WINTER WEATHER COSTS

A.G. RONHOVDE, Arctic Inst of North America, Washington, District of Columbia

The purpose of the study is to identify promising means to minimize and reduce the costs and negative effects of winter weather on economic growth and development.

The study will apply particularly to the New England area, the Upper Great Lakes Region, and to Alaska. However, the study will have application to the whole northern tier of states and to other areas which have severe winter weather.

The study will aim to identify and evaluate technological, engineering, scientific and economic techniques and programs whose application would give promise of reducing the costs of winter weather and thereby of economic benefit to affected regions.

It also will seek to identify and evaluate those research and development programs which can beneficially be applied in the near future, and to indicate subject areas where additional research and development would give promise of positive, short-term results.

An attempt will also be made to forecast for the next five to twenty years the major technological developments which may be expected to aid in achieving winter weather costs reductions.

In arriving at recommendations it will be necessary also to evaluate cultural, psychological and political impediments which may hamper application of identified technologies.

2.0259, MECHANICS OF SAND MOVEMENT BY WAVES

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Investigations will be made of the mechanics of sand movement by waves by studying experimental models in a laboratory, by making field measurements and observations, and by analytic theoretical work. Laboratory tests will involve the basic mechanics of sand grain movement under wave action, studying individual grain stresses and movement; data will be obtained in both the field and laboratory on the quantitative movement of

sand by waves for different shore configurations, and attempts will be made to relate these to incident wave and current conditions; field measurements will be made of the basic mechanics of sediment transport, particularly by the use of labeled sand grains which can be followed and identified over some distance of movement; the effect of various types of structures on sediment movement will also be examined.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0260, CORRELATION OF BEACH PROPERTIES AND INCIDENT WAVES

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Study is being made, in both field and laboratory, of the relationship between beach properties (including profile as well as sediment properties) with incident wave and water level conditions. Study also involves the effect of structures in affecting changes in these characteristics.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0261, HYDRAULICS AND DYNAMICS OF ESTUARIES

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Hydraulics and dynamics of inlets and estuaries, including both flow and sedimentation and erosion processes will be studied in models and the field, with theoretical analysis. Estuarine erosion as a result of wave action and high water levels will be a specific part.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0262, WAVE RECORDING AND ANALYSIS

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

A cooperative surf observation program with U. S. Coast Guard collects visual data on surf height, period, direction, and type of breaker at 16 U. S. Coast Guard stations. Statistical compilation is planned.

Recorded wave data are also collected at a number of locations along U. S. Coasts, and an automated system is under development.

Work is on a wave direction gage using a rotating sonic current meter as the indicator and a damped Rayleigh disc is underway.

Pressure records are also planned for obtention at a station at 70' and 35' depths directly under the present relay type gage to obtain data on changes in pressure as related to the depth of the gage and period of the waves.

Standardized analytical methods for engineering use are being developed. New types of gages (such as radar, sonar, and laser) are being studied.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0263, STABILIZATION OF SHORES BY GROINS AND JETTIES

T. SAVILLE, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Groin fields of varying design will be tested in a model basin under varying conditions of wave attack and degrees of groin fullness. Amount of sediment passing the field will be trapped and measured. Initial tests involve measurement of material prior to groin installation to establish the littoral regime along an unencumbered beach.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0264, METHODS OF BYPASSING SAND PAST INLETS

G.M. WATTS, U.S. Army, Coastal Engin. Res. Center, Washington, District of Columbia 20016

Data are collected and compiled at all known places where by works of man, sand is passed across natural or improved inlets of the shoreline. Such works presently include: a) offshore

2. WATER CYCLE

breakwater and lee sand-trap to be periodically emptied by floating hydraulic dredge plant; (b) fixed pumping plant and pipe line system at jettied inlet to provide continuous bypassing; (c) periodic dredging with floating hydraulic dredge plant in overly-widened channel in a jettied inlet; (d) weir-type jetty and retention basin to be periodically emptied by floating hydraulic dredge plant; and (e) mechanical removal and transport by truck haul from updrift accumulation to downdrift eroded area at a fixed littoral barrier. Quantitative and qualitative data, both physical and economic, are to be compiled and analyzed with the view toward development of relationships which will serve as guide lines or criteria in the design of sand transfer systems.

2.0265, GENERAL CIRCULATION - NUMERICAL MODELING OF PRECIPITATION

J. SMAGORINSKY, U.S. Dept. of Commerce, Geophysical Fluid Dynam. Lab., Washington, District of Columbia 20004

A long term numerical integration of a moist general circulation model utilizing the global grid system developed by Kurihara is in progress. Preliminary results show realistic features of the atmospheric circulation. For example, easterlies which predominate in the summer stratosphere, and the world-wide distribution of rainfall are in agreement with observations. A long-term integration of the same hemispheric moist model but with the horizontal resolution doubled produced values of the poleward transport of heat and momentum by large scale eddies which were closer to observed values.

Sophisticated primitive models of the atmosphere and oceans have been combined, creating a single interactive model of the atmosphere-ocean system. Interaction is through the exchange of momentum, heat, and the excess of evaporation over rainfall. This model will be used to study (a) the evolution of climate, (b) the possibility of very long range weather predictions, and (c) the climatic effects of artificial or inadvertent weather modification.

The large-scale hydrology of North America (east of the Rockies) covering a 5-year period was studied utilizing Travelers Research Center's analyses of some of the variables. Computations were made of mean monthly values of evapotranspiration, streamflow runoff, precipitation, atmospheric water vapor flux divergence, and surface and subsurface water storage changes. In progress is a study aimed at describing in detail the characteristics of the longitudinally averaged water vapor flux of the Northern Hemisphere, on a mean monthly basis.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0266, NUMERICAL PREDICTION OF CLOUDINESS AND PRECIPITATION

J.D. STACKPOLE, U.S. Dept. of Commerce, Development Division, Washington, District of Columbia 20233

A study was initiated to incorporate a moisture parameter in the hydrodynamic forecast model presently in use at the National Meteorological Center. The study is a sub-project of a larger effort which deals with baroclinic modeling with the primitive equations of atmospheric motion. The experience gained with the present-NMC moisture prediction model will be utilized as much as possible, but some generalization is necessary to permit latent heat feed-back into the forecasts of motion and mass fields. The more exact approach to the problem is expected to yield improved forecasts of cloudiness and precipitation. The project continues in FY68 with corrections or modifications of the model controlled by feedback from operational runs.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0267, CLOUD AND PRECIPITATION FORECAST MODEL

J.D. STACKPOLE, U.S. Dept. of Commerce, Natl. Meteorological Ctr., Washington, District of Columbia 20233

Objective - This project has as its principal aim the development of more accurate forecasts of cloudiness and precipitation. The study is a sub-project of a larger effort (baroclinic modeling with the primitive equations) devoted to improve forecasts of all

parameters in the atmosphere; and thus, its applications and relevance to agency goals are consistent with the larger project. A subordinate goal of the project is to provide information on latent heat generation in the atmosphere. Such information is expected to improve the accuracy of the primitive equation model forecasts.

Approach - The experience gained with the present NMC precipitation model has been used in the development of the new approach. Moisture is considered in a single layer in the lower-half of the atmosphere. The criterion for condensation is based on a flexible bound of mean relative humidity in the layer. Problems in obtaining automatic analysis of moisture field could slow progress.

2.0271, PERMEABILITY DISTRIBUTION AND SEDIMENTATIONAL FEATURES

J. BREDEHOEFT, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The research effort is directed toward studying what might be called 'petrophysics' in which the aim is to determine principles of the functional nature of permeability distribution as related to lithology, sedimentational processes, etc. Although the problem is complicated by the fact that the resulting sedimentational features (permeability distribution in an aquifer systems) were produced by countless hydraulic systems--no one of which can be measured now--the problem seems amenable to at least some understanding through statistical analysis and electronic computer techniques.

The major objective of the permeability research is to determine the factors and relationships that govern permeability distribution so that the physical characteristics of entire natural systems can be predicted by indirect evidence. It is proposed to develop geologic methods by which rock characteristics, as determined by sedimentational stratigraphic features, can be utilized to

2. WATER CYCLE

predict permeability distribution and the geometric form of the components of natural water systems.

Two naturally occurring hydrologic systems have been used as 'field laboratories' in which to test the conceptual ideas. Much previous research has been carried out using the Tensleep sandstone aquifer system in the Big Horn Basin, Wyoming. Investigation of the Carrizo sandstone, a coastal plain aquifer of Texas, which will be used as a second field laboratory, is now beginning.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0272, BASIC RESEARCH IN GEOMORPHOLOGY AND HYDROLOGY

C.W. CARLSTON, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

'Underfit' streams occur where local valley widening permits the streams to develop unconstricted free meanders. The Driftless Area of Wisconsin contains extremely 'underfit' streams whose flood intensities and resultant meander wave lengths and belt widths have been greatly reduced by the high storage capacity of glaciofluvial and glaciocrustine valley fills. This study started in the Driftless Area of Wisconsin on the Black Earth Creek, an 'underfit' stream, and has been expanded to include studies of incised meanders and free meanders (valley width greater than meander belt width) throughout the eastern United States. The purpose of the project is to determine the relation of the Q1.5 (bankfull discharge) to meander wave length, meander belt width, meander radius of curvature, stream width and slope. Such data will be used to determine whether the incised meanders are relics of earlier erosion cycles, to estimate the discharge required to produce the incised meanders, to reconstruct the original area-discharge relation of the incised meanders and, by comparing these with area-discharge curves for U. S. stream systems in varying climatic areas to estimate earlier precipitation regimes of the streams which now have incised meanders. In general to learn more about the hydraulic geometry of meandering streams and possibly to study the hydraulic geometry of free incised meanders in the laboratory.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0273, EXTREME HYDROLOGIC EVENTS & THEIR EFFECTS ON NUCLEAR FACILITIES

H. CARRIGAN, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The program was initiated in FY'67. at nuclear facilities is necessary to determine whether such events could initiate radioactive material releases of an unacceptable degree. A study of this type will permit answers to questions related to the amount of ground water recharge that occurs in arid environments. The likelihood that an unusually high water table rise might occur in association with floods and humid environments leading to unacceptable leaching rates and transport of buried or sorbed radioactive wastes or to lowered bearing capacities of soils supporting waste tanks or that headward erosion into burial trenches might take place at a given site during extreme conditions of run-off intensity and duration.

SUPPORTED BY U.S. Atomic Energy Commission

2.0274, CORROSION AND ENCRUSTATION MECHANISMS IN WATER SUPPLIES

F.E. CLARKE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

A variety of physical, chemical, and biological processes determine tendencies of water supplies to cause objectionable corrosion problems in wells and other water handling equipment. Knowledge of these mechanisms is necessary for proper prediction of effects and proper control. Quality characteristics of well water supplies are determined by field studies and the data are analyzed thermodynamically for evidence of potential encrustation and corrosion reactions. The work to date in deep well fields of Egypt, Nigeria, and West Pakistan has revealed that the oxidation reduction potential - pH relationship - is very important in determining magnitude of corrosion damage. Chemical equilibri-

um studies appear to indicate that degree of saturation with calcium carbonate and ferric hydroxide are major factors in determining the nature and intensity of corrosion. Encrustation with ferrous carbonate, a common problem, appears to be independent of the concentration of this mineral in the well water and to depend primarily on kinetic factors, such as flow rate. Effective control measures are being devised on the basis of these studies.

2.0275, INVESTIGATION AND ANALYSIS OF FLOODS FROM SMALL DRAINAGE AREAS IN OHIO

W.P. CROSS, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The existing program of flood studies and analyses are being supplemented to obtain an adequate measure of flood characteristics for drainage areas of less than one square mile by using additional high stage indicators (pipes).

SUPPORTED BY U.S. Dept. of Transportation - Public Rds. Ohio State Government

2.0276, SAFFORD VALLEY, ARIZONA GEOPHYSICAL STUDIES

G.P. EATON, U.S. Dept. of Interior, Geologic Division, Washington, District of Columbia 20242

To make geophysical surveys of the Safford Valley (Basin) in support of ground water investigations and to interpret these geophysical data to provide a greater understanding of ground water hydrology of the Basin.

To determine the geometric configuration of the underlying basement rocks, the thickness and character of basin-fill sediments, the areal extent and attitude of volcanic rocks and other factors that might influence the occurrence of ground water.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0277, WATERSHED SHAPE-FACTOR

A. EYSKINE, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The objective of this project is to ascertain and establish a factor which could be used in design formulas for culvert box, culvert and minor structure capacities. The factor would take into account the effect of the shape of the watershed with respect to peak concentrations of discharge from the area. At present this is not taken into account as the practice is to design for maximum discharge capacities. It is estimated that the shape can have a variable effect up to 30% of the design capacity. Thus if this effect is known a savings of up to a similar percentage figure could result.

It is proposed to select control areas and test sites in three sections of the state.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds. North Dakota State Government

2.0278, INVESTIGATION AND ANALYSIS OF FLOODS FROM SMALL WATERSHEDS IN OKLAHOMA

A.A. FISHBACK, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The magnitude and frequency of flood peaks in one to fifty square mile watersheds were investigated. Ninety crest-stage and recorder gauges were installed and library research was conducted. During 1965 ten gauges will be installed, flood discharges will be computed by hydraulic principles and flood characteristics will be studied.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds. Oklahoma State Government

2.0279, CHEMISTRY OF ATMOSPHERIC PRECIPITATION

D.W. FISHER, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

The general objective is to obtain a better understanding of environmental factors that determine the chemical nature of

2. WATER CYCLE

precipitation and to assess the role of precipitation in determining the quality of streams and of ground water.

Sampling networks are in operation in New York - New England, St. Thomas, V. I., and in North Carolina in three distinctly different environments. A specific watershed is being studied in North Carolina to relate precipitation chemistry to terrestrial water quality.

Specific attention is being given to the correlation of the sulfate and nitrate content of precipitation with atmospheric concentrations of sulphur and nitrogen to resolve basic problems on the sources of some important precipitation constituents.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0280, FLOOD-FREQUENCY AND BASIN PARAMETER RELATIONSHIPS IN SMALL DRAINAGE AREAS

H. GOLDEN, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

Purpose: To determine the factors and physical relationships that control the frequency and magnitude of floods on small drainage basins (generally less than 15 mi², and many less than 2 mi²), and develop reliable methods for estimating peak discharges.

Methods: Depending on the climatic and other features of the particular region, various methods and combination of factors are analyzed and tested for reliability, based on past and current records of flood flow, or synthesized floods. These factors include basin shape, slope, geology, vegetative cover, land use, antecedent precipitation, runoff volumes, peak discharge, and rainfall intensity and duration.

Geographical scope: Work is being conducted in 35 states and Puerto Rico as part of the program of water resources investigations conducted by the Geological Survey in cooperation with the States.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0282, DISTRIBUTION OF ELEMENTS IN FLUVIAL AND BRACKISH ENVIRONMENTS

V.C. KENNEDY, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

To determine the distribution of major and minor elements in solution, adsorbed, or in solid form in streams, to study the variation in mineralogy and exchange capacity of stream sediments, and their importance in transporting various elements, to investigate methods, such as fluorescent tracers, for following sediment movement into the marine environment and to determine changes in adsorbed ions as sediment moves into the ocean.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0283, GEOMORPHIC ASPECTS (SISTERS AND WATTS BRANCHES, MARYLAND)

L.B. LEOPOLD, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The objective is the study of basic aspects of the hydrologic cycle relating to processes by which water and sediment are delivered to stream channels and transported by them.

At the Sisters Project, a 2.2-acre wooded watershed, a detailed study is being made of the distribution of rainfall on the watershed, the rains producing runoff, the characteristics and routing of hydrographs for an ephemeral channel, the disposition of water at or beneath the ground surface during rains, and the mass movement of soil.

At Watts Branch, a small meandering channel that is mapped and permanently monumented in detail, measurements of the rate of channel movement in relation to the flow and climatic conditions are being made.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0284, LONG TERM CHANNEL CHANGES

L.B. LEOPOLD, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

A number of drainage basins ranging in size from several acres to several square miles are being selected across the United States. It is hoped that these will eventually include sites in all physiographic and climatic regions. Beginning in 1962 and to present sixty sites have been selected and measurements have been recorded. In general, the study will consist of the following measurements or installations at each site: (1) topographic and geologic mapping, (2) channel profile and crosssections, (3) soil and vegetation description, (4) crest-stage gage and rain gage, (5) measurements of erosion and mass movement, and (6) channel scour. Repetitive surveys, yearly or as needed, compared to previous surveys will provide an indication of the long-term changes occurring. Over a period of time, it is anticipated that a delineation may be made between those changes which are man-caused and those due to climatic changes.

The sites are similar in type to those that will be established as part of the Vigil Network System. It is hoped that other countries will begin such investigations and data will be collected on a worldwide basis. Techniques developed in the present study will serve as a guide for future studies.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0285, INVESTIGATION OF SCOUR AT BRIDGES IN ALASKA

L.S. LEVEEN, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

Scour at bridges in Alaska is being studied at selected sites in the field. Initially only reaches where a bridge crosses a relatively straight section of the stream channel are being studied. The stream channel is surveyed upstream and downstream of the bridge. Cross sections and longitudinal profiles of the stream bed are taken with an echo sounder for key discharges. Hydraulic and transport variable studies include sediment size analysis, current relationships, measurements of suspended load, size analysis of suspended load, velocity distribution at various stages, measurement of scour depth, and determination of the discharge-frequency relation. It is believed that analysis of the data will lead to a means of predicting scour at bridges.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.
Alaska State Government

2.0286, UNSATURATED FLOW STUDIES

W.O. SMITH, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

Work is continuing on developing the theory for describing flow in the unsaturated zone, with special reference to conditions of constant temperature and to unsaturated flow under thermal and under electrical gradients.

Further analysis will be made of theoretical developments relating porosity and moisture content, as well as grain size and sorting, to the dielectric properties of certain types of water-bearing sands, and of the effects of structure, exchange ion, and water content on dielectric properties of clays. Laboratory experimental work will include measurement of dielectric constants and the associated loss factors.

The water content of the unsaturated zone, and the mechanism of water movement during infiltration are only poorly known. An understanding of the infiltration mechanism is particularly applicable to the design of artificial recharge projects. Present methods of determining water content in the zone tend to disturb the sediments, and thereby make measurements inaccurate. The determination of the dielectric behavior and water content is well known, dielectric behavior will provide an accurate means of determining water content.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0287, HYDROGEOLOGY OF ARTESIAN SYSTEMS AND LIMESTONE TERRANES

V.T. STRINGFIELD, U.S. Dept. of Interior, Water Resources Division, Washington, District of Columbia

Water in artesian aquifers consisting chiefly of (1) limestone, and (2) sands and gravel is one of the principal sources of water supplies in the Coastal Plain province in the southeastern States. Artesian water in Tertiary limestone in Florida and southeastern Georgia is the principal source of water for municipal, industrial, and irrigation supplies. Outside the Coastal Plain in the southeastern States, the artesian systems are less extensive and less productive, but are important sources of water.

Although the aquifers are known in a general way and much detailed information has been obtained and published on local areas, regional studies are being made to obtain a better understanding of such characteristics as (1) circulation, recharge, and discharge of water in the artesian systems, (2) the relation of occurrence and circulation of the water to recharge and discharge areas and to geologic structures, (3) geologic conditions affecting permeability and waterbearing capacity of aquifers, (4) solution cavities in the limestone, (5) geochemistry of the artesian water, and (6) relation of fresh artesian water to salty water in the aquifer.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0288, THE HYDRAULICS OF GROUND WATER TESTS

R.J. SUN, U.S. Dept. of Interior, Geological Survey, Washington, District of Columbia 20242

The project was initiated in FY 67 and proposes to investigate the following aspects. The applicability of the several currently available dispersion equations to aquifers of differing geologic characteristics; justification of the use of simplifying assumptions that must be made; modification of basic equations to account for change in hydraulic head due to pumping of a sampling well. Development of a computer program to simulate ground water movement between tracer test wells and develop methods for determining aquifer characteristics on the basis of comparison of simulated and actual tracer flow tests. The results of these studies will be utilized to develop an improved mathematical model for description of the time concentration curve obtained in a two-well tracer test which has operational advantages over other field methods wherein there is a need for more sophisticated methods of applying ground water tracer techniques to waste transport by ground water through anisotropic inhomogeneous media.

B.H. WHETSTONE, U.S. Dept. of Interior, Geological Survey, *Washington, District of Columbia* 20242

Data on flood flow, drainage basin characteristics, and rainfall are being collected and analyzed. Relationships will be developed for predicting the magnitude and frequency of floods from any small watershed in South Carolina. The method will be used in highway culvert and small bridge design.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.
South Carolina State Government

2.0302, INFLOW HYDROGRAPH STUDY

L. WIARD, U.S. Dept. of Interior, Geological Survey, *Washington, District of Columbia* 20242

The magnitude and frequency of flood volumes to be expected from small drainage areas in Wyoming are to be defined, and also, the characteristic shape of flood hydrographs in relation to the physical characteristics of the basins. A rational method of accounting for the effect of embankment storage which will be useful in culvert design is to be developed. Hydrologic data

(stream flow and precipitation) will be obtained for about 50 different basins.

Data on stream length, slope, stream density, size of drainage basin, soil type, basin shape, and other factors will be compiled for each basin. Aerial photographs were adequate, or standard surveying methods, if necessary, on small drainage basins will be utilized.

The feasibility of using climatic data to extend in time flood records for a basin will be investigated, and also, the relation between rainfall frequency and runoff-volume frequency.

Assuming that rainfall frequency is defined by long term records and that general rainfall-runoff volume relations can be defined by the data obtained in this investigation, the frequency of flood peaks can be approached through time lag characteristics. The chosen approach to definition of the effect of embankment storage in reducing flood peaks requires definition of the time lag characteristics of the basin and the relation between outflow and storage at the culvert site. Time lag characteristics are being defined for each of the 50 basins as both rainfall and the flood hydrograph are being measured. Time lags are then related to the physical characteristics of the basin such as length and slope to provide a general method to be used in design. Data on stream length, slope, stream density, size of drainage basin, soil type, basin shape, and other factors are being compiled for each basin.

2.0303, DISSIPATION AND DIFFUSION OF HEAT IN STREAMS AND LAKES

N. YOTSUKURA, U.S. Dept. of Interior, Water Resources Division, *Washington, District of Columbia*

Purpose: To develop a method for prediction of the temperature variation in streams and lakes which are subjected to thermal loading.

Methods: The energy budget method of temperature prediction assumes uniform distribution of heat within a cross section of a flowing water and accounts for heat exchanges at the boundaries of the water body. It has been indicated theoretically that inclusion of longitudinal dispersion coefficients in a heat balance equation would materially affect the distribution of temperature along the length of a stream. This project will initially emphasize a basic study of the effect of heat diffusion or of non-uniform distribution of heat within the body of water on the ultimate dissipation of heat. The effect of stratification of flows, especially in estuaries, on heat dissipation will also be investigated.

2.0304, DEVELOPMENT OF HYDRAULIC DESIGN PROCEDURES FOR CONCRETE BOX CULVERTS WITH STANDARD, IMPROVED AND SIDE-TAPERED INLETS

H.G. BOSSY, U.S. Dept. of Transportation, Bureau of Public Roads, *Washington, District of Columbia*

Design aids are being developed and made available to highway engineers for rapid selection of an economic type and size of box culvert for a given site and design flood peak, by means of monographs for inlet control operation of box culverts of present types, new designs for improved capacity by use of inlet edge levels, and greater capacity side-tapered inlets.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.

2.0305, DYNAMIC PROPERTIES OF GRANULAR BASE MATERIALS IN SATURATED AND PARTIALLY SATURATED CONDITIONS

UNKNOWN, U.S. Dept. of Transportation, Bureau of Public Roads, *Washington, District of Columbia*

The effect of the degree of moisture saturation on the mechanical properties of granular base materials under high rates of strain is being studied. These stress rates correspond to those produced by traffic loadings on flexible pavements.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.

2.0306, INVESTIGATION OF RAINFALL DISTRIBUTION ON URBAN RUNOFF FOR IMPERVIOUS AREAS

D.C. WOO, U.S. Dept. of Transportation, Bureau of Public Roads, Washington, District of Columbia

The effect of rainfall distribution (with time and area) on the urban runoff hydrography for impervious areas is being studied using a mathematical model.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.

2.0307, STORM WATER INFLOW

N.G. SMITH, U.S. District of Columbia, Highways & Traffic Dept., Washington, District of Columbia

Objective: To provide a better prediction of inflow to pumping stations in the Washington area.

2.0308, RADIOACTIVE FOOD-CHAINS IN THE SUBARCTIC ENVIRONMENT

J.K. MIETTINEN, Helsingin Yli Helsing. Univ., Helsinki, Finland (AT-(30-1)3446)

Investigation of Lapps and Eskimos revealed in them increased body burdens of several artificial (90Sr, 137Cs, 55Fe) and natural (210Po, 210Pb) radionuclides resulting from fallout and enrichment through food-chains. Although the main features of this phenomenon are already known, many problems still exist. The above nuclides will be analyzed in ruminants (reindeer, elk) and predators feeding on reindeer (wolf, wolverine) as well as related animals (lynx, bear) by sample analysis, and in Lapps and southern Finns by whole body counting. The maximal body burdens of 137Cs in Finnish reindeer breeders (aver. 1.5 uCi in the whole body; ICRP MPC is 3.0 uCi) were measured in April 1965. Since then the levels have decreased by about 15 per cent per year except in 1966/67 when the decrease was 27 per cent due to exceptional grass growth. The body burden of 210Po and 55Fe is about 10 to 15 times, of 90Sr and 210Pb about 3 times higher in reindeer meat consuming Lapps than in southern Finns having a more usual 'western' diet. 210Po and 210Pb in the hydrosphere will also be investigated, as well as the specific activity concept of lead, strontium and caesium in the environment.

SUPPORTED BY U.S. Atomic Energy Commission

2.0309, BIOLOGICAL (ENRICHMENT) CHAINS OF RADIONUCLIDES IN FINNISH LAKES

J.K. MIETTINEN, Helsingin Yli Helsing. Univ., Helsinki, Finland

1. Food chains of Cs 137 from global fallout are studied in 12 lakes covering the whole range from oligotrophic to eutrophic ones. Cs 137 content in water, plankton, plants and fish are determined annually. 2. Tracer experiments in natural lakes are carried out to elucidate the limnological factors effecting accumulation in plankton, plants and fish of the elements (Cs, Sr, I, Ba, P, Ca) to which the radionuclides belong which constitute the greatest biological hazard in nuclear fission or neutron activation of soil by a nuclear explosion. 3. Excretion rates of the above elements in various fish species are determined using radioactive tracers.

2.0310, WATER RELATIONS WITH CITRUS ON THE FLATWOODS AND MARSHES OF THE EAST COAST

D.V. CALVERT, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Project Objectives: 1. To determine the effect of irrigation on growth, yield, quality, and economic returns of citrus grown on soils of the flatwoods and marshes. 2. To determine the drainage requirement of citrus under shallow drainage conditions using the pumped well technique. 3. To evaluate factors that will minimize the detrimental effects to citrus of saline water applied through low rate sprinklers.

Description of Work Proposed: 1. Controlled irrigation experiment. Soil moisture will be maintained at various levels by means of supplemental irrigation in a block of 'Valencia' orange trees. Treatment effects will be measured by yield, fruit quality and tree size. 2. Pumped drainage experiment. Shallow wells will be installed in citrus groves and water table draw-down characteristics, citrus growth and yield responses to improved drainage will be studied. 3. Salinity Experiment. Water will be applied containing varying salt concentrations through low volume sprinklers under different humidity and temperature environments to both orange and grapefruit varieties. The effect of these irrigations will be assessed by leaf drop counts, visual ratings, and leaf analysis for sodium and chloride.

SUPPORTED BY Florida State Government

2.0311, HEAT BUDGET AND EVAPOTRANSPIRATION OF FRUIT TREES

J. GERBER, Univ. of Florida, School of Agriculture, Gainesville, Florida 32601

To conduct an investigation of the heat budget and evapotranspiration of fruit trees to provide basic information about the heat budget and water balance of the fruit tree as it contributes to the overall energy budget and water balance.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0312, CONSERVATION OF WATER RESOURCES THROUGH MODIFICATION OF THE PHYSICAL AND CHEMICAL PROPERTIES OF SOIL

L.C. HAMMOND, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Objectives: (1) The effects of soil properties on soil wettability and on water entry, storage and movement in the soil profile. (2) The nature and effects of soil organic matter in soil-water relationships. (3) Creation of physical and chemical soil properties to contaminant attenuation in the soil.

Description of Work: Basic information on soil wettability, soil water evaporation and the nature of soil organic matter will be collected in laboratory studies of natural and treated soils. Meaningful soil property relationships which are found will be used to modify the soil for improvement of water entry and storage in the soil profile and reduction of evaporation. Leaching and incubation experiments will be used to obtain data on the mobility, adsorbability, and persistence of chemicals (surface-active agents, pesticides, evaporation retardants, and waterproofing materials) added to the soil.

SUPPORTED BY U.S. Dept. of Agriculture

2.0313, MOISTURE RETENTION, MOVEMENT, MEASUREMENT, AND AVAILABILITY TO PLANTS IN FLORIDA SOILS

L.C. HAMMOND, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Objective - To evaluate soil moisture in relation to plant growth and in relation to the physical properties of Florida soils.

Abstract - Experiments include comparison of neutron, suction, and gravimetric methods of measuring soil moisture in relation to timing irrigation. Moisture retaining and transmitting properties of Florida soils will be measured in the laboratory for comparison with certain field measurements. Crop growth under different controlled water tables on flatwoods soils and water use rates by various plants on well-drained soils will be a part of the study.

SUPPORTED BY Florida State Government

2.0314, WATER CONTROL FOR FOREST PRODUCTION

C.M. KAUFMAN, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

OBJECTIVES: 1. To ascertain effects of non tree vegetation particularly saw palmetto (*Sarona repens* Bartr.), on availability of soil moisture. 2. To evaluate methods of reducing water loss by controlling non tree crop vegetation. 3. To determine effective means of controlling water table levels by drainage or by irrigation.

2. WATER CYCLE

The water loss attributable to forest vegetation other than trees particularly saw palmetto, will be determined in order that justifiable control measures may be evaluated. Means of producing more favorable soil moisture conditions, such as site preparation, drainage and irrigation to a limited degree, will be investigated, leading to outlining of forest production procedures.

SUPPORTED BY Florida State Government

2.0315, EVAPOTRANSPIRATION AND SOIL MOISTURE DETERMINATION AS GUIDES TO CITRUS IRRIGATION R.C. KOO, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Work Proposed: A. Controlled experiment. Soil moisture will be maintained at various levels by means of supplemental irrigation in a block of three orange (Hamlin, Pineapple, and Valencia) and one grapefruit (Marsh) varieties. Treatment effects will be measured by yield, fruit quality and tree size. B. Develop a set of evapotranspiration curves for citrus based on moisture loss as a function of temperature by means of systematic soil moisture measurement. C. Test the practical application of evapotranspiration curves by calculating the soil moisture content in several groves with the aid of current weather records. Soil moisture measurements will be used to check the accuracy of the calculations.

SUPPORTED BY Florida State Government

2.0316, RELATIONSHIP BETWEEN EXCESSIVE SOIL MOISTURE AND CITRUS ROOT DAMAGE H.W. FORD, Univ. of Florida, Agricultural Experiment Sta., Lake Alfred, Florida

The project will evaluate the factors that influence the growth and survival of citrus roots in relation to depth and spacing of drainage tile and ditches. The effect of flooding on citrus root survival as influenced by rootstock, anaerobiosis of site, and anaerobic bacterial metabolites will also be studied.

Data will be collected from commercial groves that contain different soil types, rootstocks, and drainage procedures by utilizing water level recorders, recording rain gauges, and piezometers. Root distribution will be measured by collecting roots with a soil sugar. Effect of flooding on citrus root survival will involve measuring bacterial metabolites chemically and by gas chromatography evaluating certain indexes as an indication of the anaerobic state, and establish the minimum rate of water movement necessary to delay anaerobiosis.

SUPPORTED BY Florida State Government

2.0317, BIOLOGICAL PRODUCTIVITY RELATED TO HYDROLOGIC CONDITIONS M.C. KILIPINSKI, U.S. Dept. of Interior, Water Resources Division, Miami, Florida

In progress is an investigation of seasonal and annual changes in aquatic biological populations as affected by changes in water levels and water quality in Everglades National Park. The populations include fishes, aquatic invertebrates, sedges and grasses, plankton, and periphyton. The aquatic habitats selected for study are the fresh-water glade, the alligator hole, and the ecotone between fresh and marine waters. The ecotone involves areas where the shallow water of the open glades meets tidally influenced tributary streams. Research stations are concentrated in the Shark River Slough and the headwaters of the Shark River that extend over 200 square miles or nearly 10 percent of the entire park. New techniques have been developed for periodic quantitative sampling of the aquatic fauna while in situ quadrats have been established for quantitative study of the flora. Changes in the biomass and species composition of the biological populations will be related to salinity, water temperature, dissolved oxygen, free carbon dioxide, light, and nature of substrate.

Aquarium studies with fresh-water animals are in progress to determine their ability to survive in the water of about 3 parts per thousand chloride.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0318, EVALUATION OF RECENT VEGETATIVE CHANGES IN EVERGLADES NATIONAL PARK M.C. KILIPINSKI, U.S. Dept. of Interior, Water Resources Division, Miami, Florida

A study, based on aerial photographs of Everglades National Park taken between 1927 and 1965, is underway to relate changes in species composition and density of plant communities to changes in fresh-water supply, fluctuations in water level, and fire.

Features on randomly selected photographs of the Everglades will be identified by reconnaissance observations in the field. A Fairchild contour finder is used for delineation of planimetric details. The resulting stereoscopic models from aerial photographs of identical areas in different years are brought to the same scale for comparison by use of vertical light projector.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0319, SUBMARINE SPRINGS F.A. KOHOUT, U.S. Dept. of Interior, Geological Survey, Miami, Florida

The objective is to investigate the occurrence of submarine springs as a neglected phenomenon of coastal hydrology and to appraise the tools of remote sensing for these studies. The difficulty and expense of direct observations of submarine springs hinders their investigation. Remote sensing tools are being evaluated for application to the problem.

Overflights of known submarine springs along the Florida coastline were made by NASA Remote-Sensing aircraft. Submarine springs 12 miles offshore from Naples, Fla., and 2 1/2 miles offshore from Crescent Beach, Fla. were recognized in varying degrees by color photography, multispectral photography, and infrared imagery. Analysis of results is continuing.

2.0322, INVENTORY OF THE GULF ESTUARY SYSTEM

N.G. VICK, U.S. Dept. of Interior, Bureau of Sport Fish. & Wildf., Panama City, Florida 32401

The objectives of this study unit are to procure and document environmental and ecological data on the St. Andrew Bay System, Panama City, Florida. These data will include (1) area descriptions (2) hydrology of the bay system (3) sedimentology, and (4) samples of the biological materials available seasonally with emphasis on the sporting species of marine fishes.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

2.0323, BEHAVIOR OF ESTUARINE ANIMALS

D.J. HANSEN, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

Objective: Determine the effects of pesticides on the behavior and physiological tolerances of estuarine animals.

Procedures: A. Using apparatus in which a gradient of pesticide concentrations can be established the ability of selected mollusks, crustaceans and fish to sense and avoid pesticides will be tested. B. Animals will be exposed to pesticide concentrations that they cannot sense and avoid, and the alteration of behavior and physiological tolerances will be determined.

1. Alteration of preferences will be studied in salinity and temperature gradients. 2. After exposure to pesticides, the selected animals will be subjected to extremes of salinity, temperature and other stresses to determine if sensitivity has been changed. 3. Schooling fish will be exposed to pesticides to determine if there are changes in schooling patterns.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0324, ESTUARINE ECOSYSTEMS

G.E. WALSH, U.S. Dept. of Interior, Biological Laboratory, Sabine Island - Gulf Breeze, Florida

The purpose of this research is to determine effects of sublethal concentrations of pesticides upon estuarine ecosystems. At present, physical, chemical and biological characteristics of four very similar coastal ponds are being analyzed to learn normal seasonal variations. When these are known, three of the ponds will be treated with pesticide and one will be utilized as a control. Effects of pesticide upon population dynamics and community structures will be studied after contamination.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0325, ESTUARINE INVENTORY (FORMERLY CHEMICAL ENVIRONMENT)

J.E. SYKES, U.S. Dept. of Interior, Biological Laboratory, Saint Petersburg - St. Pt. Bc., Florida 33706

The purpose of this project is to prepare a description of physical characters, hydrology, sediments and biota in Florida estuaries of the Gulf through field study and consolidation of existing data; to work with other Gulf States through the Gulf States Marine Fisheries Commission in standardizing techniques and data assimilation in similar state projects; and to contribute jointly

toward the formation of a Gulf of Mexico estuarine atlas. Hydrochemical analysis will continue on allied Laboratory projects as shown for the former Chemical Environ Project.

2.0326, URANIUM AND HYDROGEN RADIONUCLIDES AS NATURAL TRACERS IN THE FLORIDAN AQUIFER

J.K. OSMOND, Florida State University, Graduate School, Tallahassee, Florida 32306

The proposed research involves the study of the distribution of H-3, U-234, and U-238 in waters of the Floridan Aquifer to see if variations in these radionuclides can add to our understanding of the hydrology of the aquifer. Water samples will be collected from wells, springs, and surface water in Northern Florida and the tritium and uranium content determined, as well as the U-234/U-238 ratio. Preliminary findings have shown that these values vary widely in a pattern largely determined by the extent of local recharge of the aquifer.

Of particular significance is the variation of U-234 relative to U-238 because these isotopes do not fractionate by normal chemical processes (and thus the variation is due to the factors of mixing and time only), and the one (U-234) is the radiogenic daughter of the other (U-238) with a half-life of 250,000 years. This means that this ratio is a function not only of present hydrologic conditions but of those existing in the past (Pleistocene Epoch) as well.

Florida State University

2.0327, REMOTE SENSING, GULF COASTAL AREA, CENTRAL FLORIDA

R.N. CHERRY, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida

Purpose - To develop criteria utilizing remote sensing techniques to identify areas where fresh water is likely to occur in an aquifer in near-shore areas.

Methods - An aerial survey will be conducted to sense the thermal contrasts of aquifer and sea water under at least four conditions- during high and low tides in a period when fresh water stages are high and during high and low tides when fresh water stages are low.

Water temperatures, water velocity, and specific conductance of water from submarine springs previously located will be determined. The water stages of fresh water and sea water will be recorded. These determinations will be compared with remote sensing data which indicate submarine discharge and the relative position of the zero piezometric contour.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0328, LAKE HYDROLOGY STUDIES

G.H. HUGHES, U.S. Dept. of Interior, Geological Survey, Tallahassee, Florida

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Florida.

Available water-level records for fresh-water lakes in Florida show appreciable variation among differences between the highest and lowest observed water levels of individual lakes. The differences range from 2 to 6 feet for about one-half of the total number of lakes and from 6 to 12 or more feet for the remainder. The objective of the initial phase of a general study of lakes is to relate the magnitude of the water-level fluctuations to the type of inflow that predominates and to the physical characteristics of the lake and its drainage basin. The concepts developed for the study will lead to a better understanding of lake-level fluctuations and to more meaningful interpretation of lake-level records.

Subsequent phases of the study will deal with lake evaporation and variations of chemical quality and temperature of the lake water.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Florida State Government

2.0329, REMOTE SENSING, EVERGLADES AREA, FLORIDA

M.C. KOLIPINSKI, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida

Purpose: To determine the relations between water conditions and biological populations in the Everglades by interpretation of airborne data and to develop new applications in natural resources research for data from remote sensors.

Methods: Spectral reflectance measurements of floral communities and water will be obtained using an airborne 18-channel optical-mechanical scanner. The data will be accumulated in a form that will allow use of a computer to identify and map the distribution and amount of selected communities. Remote sensing data will be examined for potential in: detecting plankton blooms, locating alligator holes, and estimating populations of large animals.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0330, WATER RESOURCES STUDY, DUVAL COUNTY, FLORIDA

G.W. LEVE, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Florida.

Purpose: To determine the surface- and ground-water resources of Duval County.

Methods: The investigations of the geologic and general hydrologic characteristics of the Floridan aquifer which began in 1960 will be expanded to provide quantitative and qualitative hydrologic characteristics of the aquifer. Geologic and hydrologic data will be obtained for the surficial sand and shallow limestone aquifers. Water use data will be obtained to determine trends in water use. The flow characteristics dispersion patterns and salinity of the St. Johns River and tributary streams will be determined.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Florida State Government

2.0331, HYDROLOGY OF UPPER OLD TAMPA BAY, FLORIDA

J.A. MANN, U.S. Dept. of Interior, Water Resources Division, Tallahassee, Florida

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Florida.

Purpose: To provide data for evaluating the hydrological effects of conversion of the bay into a fresh water lake and information by which to judge the feasibility of similar plans in other areas of the State.

Methods: The study will include the area of the proposed lake and an additional 25 to 35 square miles of land adjacent to the lake in Hillsborough and Pinellas Counties. The quantity and quality of surface and ground-water inflow into the bay will be determined. Continuous conductivity and stage gages will be installed on the lake and the bay, and on selected wells in the area to determine the degree of interconnection between the aquifers and the fresh water lake. Conductivity traverses will be made of the upper part of the bay, supplemented by sampling sites, to determine ground-water discharge into the bay. An evaluation will be made of existing geologic and hydrologic data to determine the relation between changes in water quality and ground-water storage. The areal extent, thickness, and permeability of clay beds underlying much of the area will be determined. The fresh water-salt water intergace will be monitored continuously.

2.0332, DEVELOPMENT OF WATER SUPPLIES FOR IRRIGATION IN THE SOUTH

J.R. CARREKER, U.S. Dept. of Agriculture, Athens, Georgia

Object: To investigate conditions and methods under which shallow groundwater, sand and limestone aquifers, ponds, and other surface and subsurface water supplies and storage facilities can be developed as sources of water for irrigation. Also to develop design criteria.

Plan of Work: Based on information on shallow and deep ground water sources acquired from surveys of State and Federal groundwater agencies, etc., test installations are made. Borings, test wells, pits, and other methods of exploration are used to determine the nature of the aquifers and their potential productive capacities. Water quality is determined and special attention given to possibilities of using water supplies having higher acid or salt contents than normally considered desirable. Special problems in design, construction, and management of surface storage structures are considered. Available water supplies from surface sources are determined. Measurements include rate and amount of runoff and streamflow from small watersheds in relation to size, soil, ground cover and land management.

Cooperation: Georgia and South Carolina Agricultural Experiment Stations; SCS.

SUPPORTED BY U.S. Dept. of Agriculture

2.0333, RELATION OF CLIMATIC AND WATERSHED FACTORS TO RUNOFF RATES AND VOLUME YIELDS

J.C. STEPHENS, U.S. Dept. of Agriculture, Athens, Georgia

Object: To identify the climatic and watershed factors influencing the size, frequency, and duration of storm flows, and seasonal and annual water yields, including surface and subsurface components, from agricultural watersheds. To evaluate these factors quantitatively and to develop procedures by which the magnitude and frequency of storm runoff, and seasonal and annual net water yields may be estimated for ungaged watersheds in the southern states.

Plan of work: The work is conducted on the Pigeon Roost Creek experimental watershed near Holly Springs, Mississippi, the Little River experimental watershed, Tifton, Georgia, on a complex of agricultural watersheds in Southern and Central Florida, on Ahoskie Creek watershed in Northeastern North Carolina, and at Watkinsville, Georgia. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: Rates and duration of streamflow; precipitation patterns, antecedent moisture; season; soils; land use; conservation and watershed management practices; ground-water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape, and other geomorphic attributes of the watersheds. On Little River experimental watershed, digital instruments are being installed to give a synoptic picture of hydrologic conditions over the entire watershed at 5-minute intervals.

SUPPORTED BY U.S. Dept. of Agriculture

2.0334, PRECIPITATION CHARACTERISTICS INFLUENCING RUNOFF FROM AGRICULTURAL WATERSHEDS

J.C. STEPHENS, U.S. Dept. of Agriculture, Athens, Georgia

Object: To develop an understanding of the amounts, duration, areal and seasonal distribution, storm paths, and other characteristics of rainfall as affected by geographic location, topographic location, and other factors, to the extent that the characteristics influence runoff from agricultural watersheds in the southern part of the United States.

Plan of Work: Objectives of the studies are currently being sought through networks of recording raingages on the Pigeon Roost Creek experimental watershed near Holly Springs, Mississippi; and through networks of gages on agricultural watersheds in Southern and Central Florida, and Northeastern North Carolina. A dense network of digital recording gages is operated on the

2.0335, RUNOFF PRODUCTION BY UNIT SOURCE AREA FOR AGRICULTURAL WATERSHEDS IN THE SOUTH

J.C. STEPHENS, U.S. Dept. of Agriculture, *Athens, Georgia*

Object: To evaluate quantitatively, as one of the important factors in predicting runoff from ungaged watersheds, the runoff producing potential of the major individual soil-cover complexes in the South under typical conditions of use and treatment.

Plan of Work: The study is currently underway on unit-source watersheds at Holly Springs, Mississippi, and Watkinsville, Georgia. Correlations are made between such factors as runoff, precipitation, land use and conservation practices, and the physical and chemical characteristics of soils.

SUPPORTED BY U.S. Dept. of Agriculture

2.0336, SUBSURFACE AND GROUND WATER ACCRETION, DEPLETION, MOVEMENT AND CONTRIBUTION TO STREAMFLOW

J.C. STEPHENS, U.S. Dept. of Agriculture, *Athens, Georgia*

Object: To develop methods for predicting ground water accretion and movement, subsurface and ground water contribution to streamflow, and basin recharge in relation to watershed geology, soil and climatic factors, storm runoff, land use and treatment, and watershed protection programs; to evaluate the hydrological factors governing transmission gains and losses in stream channels in the southern states; and to identify and measure geologic components associated with water yields from ponds, pits, and irrigation wells in the southern coastal plains.

Plan of Work: The work is currently in progress on the Pigeon Roost Creek experimental watershed at Holly Springs, Mississippi, on agricultural watersheds in Southern and Central Florida, in Northern North Carolina, and on the Little River experimental watershed near Tifton, Georgia. Among other factors, the investigations include: Geologic mapping; ground water observations; soil moisture determinations; transmission capacities of soils and aquifers; the consideration of influent and effluent streamflow; and the development and improvement of geological interpretations to predict ground water yields from dug ponds and pits, and the characterization of surface landforms associated with ground water yields.

2.0337, EFFECTS OF SOIL, TOPOGRAPHY, CLIMATE, CROPPING AND MANAGEMENT PROCEDURES ON RUNOFF AND EROSION, AND ON THE PREDICTION OF SOIL LOSSES

J.R. CARREKER, Univ. of Georgia, U.S.D.A. Sc. Watersh. Res. Ct., *Athens, Georgia* 30601

Object: To evaluate (1) the effects of slope steepness and length, rainfall amount, intensity and duration, cropping practices, tillage methods, and other procedures on field runoff and soil losses; and (2) the relationship of factors affecting runoff and soil loss in the prediction of these losses.

Plan of Work: The collection of runoff and soil loss data from soil and water management and cropping practice plots under natural rainfall will continue on several land resource areas. New practices such as interseeding of row crops, plow-plant, and mulch tillage will be evaluated under different soil and slope conditions, and their effectiveness compared with selected conventional practices. The loss of farm chemicals in washoff will be studied on small plot and field areas. Other studies will be concerned with slope effects and with the relation of soil characteristics to soil erodibility. The data collected will be applied in the soil loss prediction formula to fill in the gaps for data needed in the application of this formula in conservation planning. Wind erosion control measures will be adapted to southeastern conditions.

SUPPORTED BY U.S. Dept. of Agriculture

2.0338, SPRING AND SUMMER HORTICULTURAL CROPS

S.A. HARMON, Univ. of Georgia, Agricultural Experiment Sta., *Athens, Georgia* 30602

1. To determine the effect of irrigation and hormone sprays when used singly and in combination in the production of fall grown tomatoes. 2. To determine the effect of irrigation and soil fumigation when used singly and in combination on yield of tomatoes, sweet potatoes, and strawberries. 3. To measure the effect of frequency and amount of irrigation water applied and the inter-relationship of these to rate of fertilization on yields of tomatoes and sweet potatoes.

Description of Work: The use of hormone sprays has been completed and the use of plastic mulches with and without stakes on fall tomatoes is now being studied. Tomatoes are set in August, staked vs. unstaked, and replicated treatments of black and clear plastic with check are used. Irrigation vs. no irrigation using an overhead Skinner System will be compared also.

The interaction of fertilization and irrigation on yields of Irish potatoes and beans is being studied. Two rates of fertilization and four irrigation treatments are used. Otherwise normal culture and harvesting methods used.

2.0339, TRACING STORM AND BASE FLOW TO VARIABLE SOURCE AREAS ON FORESTED HEADWATERS

J.D. HEWLETT, Univ. of Georgia, Graduate School, *Athens, Georgia* 30602

Many important hydrologic decisions about the source of floods, the need for structures and the control of water pollution depend on detailed knowledge of the path and timing of flow from upland areas. Neither standard nor experimental methods are presently adequate to classify or describe the source and timing of water flowing past a measuring station. For example, classical hydrograph separation methods and associated terminology are particularly inapplicable to forested headwaters. The Principal Investigator has initiated a new concept of forest runoff produced chiefly by subsurface flow from variable source areas.

No adequate records of rainfall and streamflow from fully forested Piedmont areas exist. A 60-acre forested catchment near Athens, Georgia, will be operated for about 3 years, long enough to apply the variable source area concept to description and prediction of the source and paths of flow, the relative magnitude of the different types of flow, and the rate of turnover in water stored in various portions of the basin. Methods will include rainfall and streamflow measurement, soil mantle surveys by drilling, seismic and electric resistivity methods, soil water measurement by nuclear methods, and eventually a radioactive tracer to determine turnover rates.

2.0340, A STUDY OF SUBSURFACE FLOW INTO MOUNTAIN STREAMS AS RELATED TO TOPOGRAPHY AND PARTIAL SOURCE AREAS

J.D. HEWLETT, Univ. of Georgia, Graduate School, *Athens, Georgia* 30602

The purpose of this work is to demonstrate the extent and importance of partial source areas for subsurface flow from two mountain forest areas, one in the Appalachians and one in Japan. Records from the two areas will be analyzed by a common method which will include common terminology and hydrograph techniques. Antecedent moisture conditions over the catchments will be estimated by a universal soil moisture prediction equation and checked in the field. Delivery of water under different antecedent conditions along the slope from stream to water divide will be derived from rainfall and streamflow records and a model for such flow will be offered as a contribution to existing hydrograph simulation programs which assume runoff to be essentially a linear process. This study proposes to show just why the runoff process in mountain areas is not linear.

2. WATER CYCLE

The work will be done chiefly at the University of Georgia and the Coweeta Hydrologic Laboratory, Dillard, Georgia. In addition the records and some staff help will be available at the experimental watersheds of the Tokyo University forests.

2.0341, TRACING STORM AND BASE FLOW TO VARIABLE SOURCE AREAS ON FORESTED HEADWATERS

J.D. HEWLETT, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

To determine the source and path of travel of storm and base flows from a forested basin.

A 60-acre forested catchment at Whitehall, Georgia will be gauged and operated as an observation watershed for about three years in order to describe the behavior of water on and in the soil. Primary measurements will be streamflow, rainfall, soil moisture, ground water and soil physical properties. Flow will be calculated and expressed in various ways in order to relate volumes of water to source areas and also to rate the response of this catchment to others in the Piedmont province. The organic and inorganic solutes and sediments will be measured in detail by personnel of the Southeast Water Laboratory and an attempt will be made to relate these to the source of water flows. Results will be used to support and clarify some new concepts of streamflow as generated by variable source areas and unsaturated flow, rather than by surface runoff and groundwater only.

2.0342, ECOLOGICAL SIGNIFICANCE OF ORGANIC RELEASE PRODUCTS OF MARINE AND FRESHWATER ANIMALS

R.E. JOHANNES, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The term 'release products' refers here to mucus, molts and dissolved organic matter released by aquatic animals. Recent work indicates that these materials play a variety of quantitatively significant roles in the flux of energy and nutrients in aquatic ecosystems. Here, we will make measurements of the release rates of free amino acids and total dissolved organic matter by a wide variety of benthic and planktonic freshwater animals. Mucus release rates will be determined for a variety of corals, jellyfish, and other mucus producers. Molting rates of the benthic estuarine shrimp, *Palaemonetes pugio*, will be determined along with the organic content of these molts. Loss of organic matter by the above routes will be compared with the rate of oxidation of organic matter during respiration, and attempts will be made to estimate rates of energy flow via these pathways in natural marine and freshwater communities. The utilization of these release products by other organisms will also be investigated.

2.0343, THE PERSISTENCE IN AN ERODED SOIL OF TILTH IMPROVEMENT ENGENDERED BY A SOD-BASED ROTATION

L.S. JONES, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

(1) To determine the changes that occur in soil aggregate distribution, water stability of soil aggregates and the organic matter and nitrogen level when the soil management practice is changed from sod-based rotation to continuous cropping. (2) To determine the changes that occur in water infiltration on the above described soils. (3) To determine the effects of continuing cropping on the optimum moisture for tillage of soils previously in sod-based rotations.

Soils on which sod based rotations have been in progress for 8 and 12 years will be plowed and row cropped for a minimum of three years. Corn, at a plant population of 15,000 will be used as the row crop. Nitrogen will be applied at a 150 pound per acre rate. Limestone, phosphorous, and potassium will be applied at rates sufficient to assure the maintenance of adequate levels of those materials. (1) Soil samples will be collected from both the surface and subsoil prior to the initiation of the experiment and

for three succeeding years. Water stability and size distribution of aggregates, organic matter, and nitrogen will be determined in the laboratory. (2) Infiltration rate will be determined in the field on selected plots. (3) Using suitable laboratory or field methods, an attempt will be made to relate the effects of cropping systems to the optimum soil moisture content for tillage.

2.0344, RELATION OF PHYSICAL CONDITIONS OF SOILS AND RESULTS OBTAINED FROM IRRIGATION

R.A. MCCREERY, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

A. To determine the effects of irrigation on: (1) Moisture intake and transmission characteristics of the soil. (2) Aeration characteristics of soil. (3) Morphological and physiological characteristics of crop plants. (4) Ion uptake under field conditions. B. To evaluate the accuracy and reliability of existing moisture measuring devices.

Description of Work: Additional sites of the 11 soil series already under study will be characterized fully to learn the magnitude of variations in properties. It seems possible that other criteria than those presently in use for some series separations may have to be developed by soil surveyors if the series concept is to be useful in crop management on the Piedmont. The slate belt series, 4 Herndon and Georgeville will be included in the current years investigations.

Effects of bed configuration on yield of mechanically planted peanuts under irrigation will be studied. These effects may have been masked in the past when hand planting was used because of excessive traffic by personnel doing the planting.

2.0345, FIELD EXPERIMENTS ON THE FLUX OF RADIONUCLIDES THROUGH A SALT MARSH ECOSYSTEM, RENEWAL

L.R. POMEROY, Univ. of Georgia, Graduate School, Athens, Georgia 30602 (AT(40-1)-3238)

After some 12 years of work on the salt marshes of Georgia by a number of investigators, it is now possible to begin building models of the flux of materials through the system. A compartmental-diagram model, showing standing stock and flux of phosphorus has been constructed. This is now being transformed into a mathematical model suitable for computer simulation of events in the salt-marsh ecosystem. The model will be tested and refined by computer techniques. Deficiencies in our data shown by computer analysis will be remedied by additional, small-scale field and laboratory work. Manipulation of the model simulating changes in flux and storage of phosphorus by various populations (compartments) will help us predict the effect of various natural and man-made changes on the ecology of salt marshes.

In its present primitive state our model tells us that the marsh grass, *Spartina alterniflora*, which is the dominant primary producer, is unusually important in the biogeochemistry of phosphorus in marshy estuaries. *Spartina* appears to be taking all its phosphorus requirements from subsurface, reduced sediments that would otherwise be a sink. This phosphorus is released into the water when the *Spartina* dies and decays, as most of it does. This process undoubtedly has great significance in maintaining high productivity in the estuary.

2.0346, A GEOGRAPHIC ANALYSIS OF THE HYDROLOGIC RESPONSE IN THE SOUTHEASTERN UNITED STATES

J.F. WOODRUFF, Univ. of Georgia, Graduate School, Athens, Georgia 30602

The proposed research is directed towards establishing the broad regional patterns of hydrologic response in the Southeastern United States. Maps will be drawn based on the hydrologic response computed: as an average for the 30-year study period; as

2. WATER CYCLE

a 30-year average for the cool and warm seasons; as a 'running average' over the 30-year period; and for precipitation events of varying magnitudes. It is expected that these maps will show regional variations in how watersheds handle their precipitation; how this varies with season; with magnitude of precipitation event; and how it has changed in the last 30 years as the result of man's activities.

In all cases, hydrologic response will be determined by dividing the runoff by total precipitation for the periods or events being studied. Runoff will be separated from discharge by Hewlett's method. The response factor will be computed for 300 stations with 'good' records and spaced as evenly as possible across the study area. Isolines of hydrologic response will be interpolated using these point values.

2.0347, AN ANALYTICAL AND EXPERIMENTAL STUDY OF BED FORMS UNDER WATER WAVES

M.R. CARSTENS, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The development of, the geometry of, and the drag exerted by bed forms (dunes) which occur on the sea bed under first-order Stokesian waves has been studied experimentally in an oscillatory-flow water tunnel. Three series of runs were performed with a different bed material in each series--0.297 mm glass beads, 0.585 mm Ottawa sand, and 0.185 mm Ottawa sand. Total amplitude of the oscillating water was constant during each run and was varied throughout the range from 0.25 ft. to 3.0 ft. for each series of runs. A final report for Contract DA-49-055-CIVENG-65-1 (Georgia Institute of Technology) was issued in September 1967. Publication as a Technical Memorandum of the Coastal Engineering Research Center, U. S. Army Corps of Engineers is pending.

2.0350, STUDIES OF SAPROLITE AND ITS RELATION TO THE MIGRATION AND OCCURRENCE OF GROUND-WATER IN CRYSTALLINE ROCKS

V.J. HURST, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

In the southeastern United States saprolite, weathered rock in which the original textures and structures are preserved, occurs between rock and soil. Near the soil-saprolite boundary develops a low permeability layer which retards infiltration and increases run-off during times of heavy rainfall. This proposal is concerned with the mineralogical, chemical, and textural character of this low-permeability zone, and the correlation of its occurrence and severity with rock type, rock structure, and topography. In order to determine the nature of this zone, the complete profile from soil through saprolite to parent rock must be studied for comparison. Special attention will be directed to determining whether traces of faults, shear zones, and joints act as preferential channels through the low-permeability layer.

2.0351, PILOT STUDY OF THE PROBABILITY OF OCCURRENCE OF CLIMATOLOGICAL PHENOMENA IN THE ATLANTA AREA

C.G. JOHNSON, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The purpose of this research is to examine in progressive steps the relationship between present recorded climatological data and its effect upon specific systems of industry. Historical climatological data will be arranged by statistical methods and used to build probability predictive models. These models will then be used to compare and verify their reliability and validity with current local climatological occurrences. These developed models will then be studied with respect to their specific influence on local systems of industry for degrees of predictable relationships. The basic research strategy is planned on a series of progressively larger pilot studies. Phase I of the research is complete and the initial pilot model gave positive results. The research at this stage is nonsponsored and is primarily used as a subject for student development at the graduate level in the School of Industrial Engineering at the Georgia Institute of Technology.

2.0352, ESTUARINE HYDROGRAPHY AND ITS ROLE IN TRANSPORT OF NATURALLY PRODUCED FOODS AND POLLUTANTS

T.L. LINTON, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The major objective of the program is to conduct a hydrographic study of the three representative types of estuaries that are found in Georgia. The estuaries of Georgia, as well as those of the entire United States, are being destroyed at an accelerated rate. Research is needed to provide basic information concerning estuaries to serve as a guide in formulation of The National Estuary Policy. Through studies of: (1) water mass movements, (2) seasonal temperature, salinity and oxygen patterns, (4) seasonal import of organic/inorganic materials, and (5) seasonal current patterns, a better understanding of the role of hydrographic factors in the distribution of nutrients and pollutants into and throughout the estuaries.

The estuaries of Georgia exist in a relatively undisturbed condition. This study will provide basic information concerning the conditions that are fairly close to the natural state before man-made manipulations occur, and may thus explain some of the causes of the high productive capacity of estuaries. With increases in population and industry the estuaries will be subject to greater pollution pressure. The hydrographic characteristics of estuaries must be known and understood in order to predict the amounts and kinds of effluents that estuaries can receive and their ultimate distribution after entry.

2.0353, THE EFFECT OF A PERMEABLE BED ON SEDIMENT MOTION

C.S. MARTIN, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The proposed study is a continuation of an investigation that originally was comprised of three phases. In the completed first phase of the study the magnitude of the seepage force on the top layer of sediment particles on a plane slope was determined. This was accomplished by subjecting the plane slope to seepage flow and then measuring the apparent angle of repose and the piezometric-head gradient within the bed at failure. From the experimental results the seepage force on the top layer of bed particles was computed to vary from 1/3 to 1/2 times the corresponding seepage force on sediment particles well within the bed.

The purpose of the proposed second phase of the study will be to determine the criterion governing incipient sediment motion when a plane bed is subject to not only seepage through it but boundary-layer flow over it, as is present in a stream channel. Experiments will be conducted with sand comprising the bottom of a rectangular water channel.

The third phase of the study will be a continuation of the second phase in that the same experimental setup will be utilized. In this case the effect of the seepage force on sediment transport will be ascertained. The sand bed will be allowed to move as the flow through the channel and the seepage flow into or out of the bed are varied.

2.0354, TURBULENT FLOW THROUGH POROUS MEDIA

P.G. MAYER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

Turbulent flow through porous media is not treatable by Darcy's law since the inertial effects may not be neglected.

In the proposed study, a mathematical solution will be attempted using finite element techniques as applicable to computer solutions.

A laboratory investigation is proposed to elucidate the physical constants pertaining to turbulent flows through homogeneous and non-homogeneous media.

The results of the study will be useful in predicting flow patterns in coarsely porous media and to determine pressure distributions in earth and rock fill structures.

SUPPORTED BY Georgia Institute of Technology

2.0355, FLOW THROUGH ANISOTROPIC LAYERED MEDIA

P.G. MAYER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

Darcy's law of flow through porous media establishes a linear relationship between seepage velocity and hydraulic gradient. When applied to a general three-dimensional flow field, the 'seepage coefficient' is represented by a 3-by-3 matrix defined by nine numerical constants.

Under anisotropic conditions the permeability matrix is symmetrical and three principal axes exist in the direction of which the seepage velocity components are colinear with the pressure gradients.

The determination of equipotential lines and of streamlines is possible for anisotropic layered media by the mathematical method of Finite Elements.

The laboratory study and possible field investigation will include efforts to establish physical constants for natural porous media.

The mathematical study and the laboratory investigations will be correlated to provide tools for solutions of problems involving ground water recharge and subsurface disposal of liquid wastes.

SUPPORTED BY Georgia Institute of Technology

2.0356, FLOW THROUGH UNSATURATED POROUS MEDIA

G.M. SLAUGHTER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The first phase of this investigation will consist of a library search. It is felt that a collection of abstracts of studies made to date of fluid flow in the zone of aeration would be beneficial.

It is anticipated that the investigation will be extended to a laboratory study of flow in an unsaturated porous media. It is felt that more basic knowledge of this subject is required in order to completely solve the hydrologic equation.

SUPPORTED BY Georgia Institute of Technology

2.0357, STATISTICAL ANALYSIS OF FLOOD PEAKS OF GEORGIA RIVERS

G.M. SLAUGHTER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

A statistical study, using the annual flood series of the 198 rivers/streams of Georgia, which are measured by the U. S. Geological Survey, will be made. The statistics to be computed include the following: mean, variance, standard deviation, coefficient of variation, coefficient of skewness, and coefficient of kurtosis. The computations will be performed on a Burroughs B-5500 digital computer by the use of an ALGOL 60 program.

On six of the rivers, which have 70 or more years of record, the statistics will be investigated in a number of different chronological subsets in an effort to correlate the findings from the rivers of shorter record.

The purpose of the study is to provide a better method of establishing the design discharge for a given frequency (recurrence interval) for a given hydraulic structure.

SUPPORTED BY Georgia Institute of Technology

2.0358, AIR INJECTION INTO AN AQUIFER

G.M. SLAUGHTER, Georgia Inst. of Technology, School of Engineering, Atlanta, Georgia 30332

The proposed research plan involves a laboratory investigation of injecting air into a permeameter. It is anticipated that the injected air will reduce the flow through the porous media. The injected air thus becomes a barrier to the flow which could prove quite beneficial in the case of a salt water intrusion problem.

A preliminary study has been conducted in which the results were not encouraging. That is, the injection of air into two different uniform sand test sections only decreased the discharge by approximately 10 per cent. It is felt that this small reduction is due in part to the scale effect of the permeameter and therefore, additional investigations with a different type of permeameter are planned.

SUPPORTED BY Georgia Institute of Technology

2.0359, THE EXTRACTION OF POTASSIUM FROM FRESH AND SALINE WATERS BY CLAY MINERALS

C.E. WEAVER, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The general objective is to determine how and to what extent the chemistry (particularly potassium) of fresh and saline waters is controlled by clay minerals and gels, both in the laboratory and in natural environments.

Using waters of various compositions, the ability of a variety of clay minerals to extract specific cations will be determined and the mean free bonding energies of the cations calculated. The release of interlayer clay water to the fluid will be measured and the factors controlling the return of adsorbed cations to the fluid phase as the chemistry of the water changes will be determined.

2. WATER CYCLE

Georgia Institute of Technology

2.0360, THE EFFECT OF CLAY MINERALS ON THE CHEMICAL COMPOSITION OF FRESH AND SALINE WATERS

C.E. WEAVER, Georgia Inst. of Technology, Water Resources Center, Atlanta, Georgia 30332

The general objective is to determine how and to what extent the chemistry (Ca, Na, K, Mg, Al, Si, Mn, Fe) of fresh and saline waters is controlled by clay minerals and associated organic matter, both in the laboratory and in natural environments (rivers, estuaries, ground water).

The exchange of cations between the clay and the water can be a major factor in controlling the chemical composition of natural waters. Much of the ground water in sediments is present in muds and shales or has been squeezed from them during burial. Efforts will be made to determine how the clay minerals change the chemistry of pore water during deep burial (down to 20,000 feet).

Laboratory experiments will be conducted to determine quantitatively, the nature of the exchange of cations between the various clay minerals and organic materials and various natural waters. It will be determined how the nature of the clay-organic-water interaction varies as the solid material moves from one water environment to another. Mechanisms effecting ion exchange will be studied and attempts will be made to determine how strongly some of the cations are bonded to the solids.

A series of clay cores extending to a depth of 16,450 feet will be studied. Chemical, mineralogic and isotope studies of these cores will be made to determine how the clays modify the interstitial waters during burial.

Field experiments will be carried out in one or more river systems to determine quantitatively what effect the suspended clay and organic material has on the annual load of cations carried by the rivers.

2.0361, TROUT STREAM - SURVEY OF STREAMS AND THEIR WATERSHEDS

C. HASTINGS, State Game & Fish Commission, Atlanta, Georgia

To collect additional pre-development biological and physical data regarding Walnut Fork and Hood Creeks.

To measure biological and physical changes in Walnut Fork and Hood Creeks as erosion control methods and devices are employed.

Procedures: Both biological and physical data will continue to be taken on Walnut Fork and Hood Creeks this fiscal year to augment data taken previously and to measure biological and physical changes as erosion control methods and devices are employed.

Data which will continue to be taken on these two streams include amounts of fishing pressure (creel census), water temperatures, air temperatures, stream widths, stream depths, volumes of flow, water velocities, species of fish taken, numbers of fish taken, lengths of fish, weights of fish, types of stream bottom, amounts of cover, amounts of bottom organisms, classifications of bottom organisms, use of spawning sites--both natural and constructed, pictures, movements of trout, turbidities, dissolved oxygen content, carbon dioxide content, hydrogen-ion concentration, total hardness, and silt deposition.

Fish population studies (500 feet in length) will be continued on these streams at the rate of three sample areas per mile. Cresol and/or shocking equipment will be used in collecting fish.

The bottom samples will be collected by the use of a surber sampler which takes a sample of one square foot. Bottom samples will be qualitative and quantitative. Organisms will be identified to order and samples will be determined in quantity by volumetric means.

The survey findings and any additional recommendations will be reported.

2.0362, MECHANICS OF FLUID RESISTANCE

H.J. TRACY, U.S. Dept. of Interior, Water Resources Division, Atlanta, Georgia

The one problem that is perhaps the most characteristically hydraulic in nature is the problem concerned with fluid resistance at a boundary. The expenditure of energy throughout the flow is dependent upon the boundary resistance. Adopting a basic viewpoint, the problem is one dealing with the transport of energy and momentum by turbulent motion and the effect of these transport processes in determining the mean flow fluid. In other words the problem is vitally dependent upon the mechanism by which turbulent fluid motion receives, transports, and expends energy.

The objective of this study is to attempt to describe the fluid resistance in terms of dimensionless ratios characterizing the physical dimensions of the roughness projections. The descriptive measurement of these effects, however, can contribute to the development of any ultimate theory only if they are relevant to the mechanisms which determine the flow field, in other words, relevant to the aforementioned transport processes.

Because suitable instrumentation needed to investigate and measure point velocity, turbulence, and energy spectra in water is not yet available, the experimental work will be performed in an artificially roughened, closed, circular, air tunnel using a hot-wire anemometer. This work will consist of tests in which roughness resulting turbulence and energy spectra will be used to determine what geometric ratios representative of the boundary roughness are significant as well as their influence upon choice of friction coefficient.

2.0363, IRRIGATION AND FERTILITY PRACTICES FOR FLUE CURED-TOBACCO

G.N. SPARROW, Univ. of Georgia, Agricultural Experiment Sta., Tifton, Georgia

Objectives: 1. To determine a favorable balance of soil moisture and plant nutrients for high yields of good quality tobacco. 2. To evaluate the hazard of excessive rains following immediately after an irrigation. 3. To express these determinations in standard terms in order to permit wide application of results.

Description of work: 16 treatments, consisting of 4 levels of nitrogen under 4 levels of soil moisture, are arranged in a randomized block design with 3 replications. Data obtained includes soil physical characteristics, soil moistures, irrigation amounts and frequency, yield, grade, acre value and chemical and physical analysis of leaf samples.

SUPPORTED BY Georgia State Government

2.0364, THE RESPONSE OF PEANUTS TO SUPPLEMENTAL IRRIGATION

J.R. STANSELL, Univ. of Georgia, Agricultural Experiment Sta., Tifton, Georgia

Objectives: 1. To determine the amount and frequency of supplemental irrigation required for optimum production of runner peanuts. 2. To determine the limits of soil moisture within which runner peanuts will produce satisfactory yields of high quality. 3. In cooperation with interested specialists, to study and control if practical, the undesirable side effects of irrigation on peanuts, particularly excessive pod shedding. 4. To ascertain the comparative responses of selected varieties of peanuts to high levels of soil moisture.

Description of work: A replicated study will be initiated for each of the four objectives above. (1) Runner peanuts will be grown under 4 levels of soil moisture. (2) An automatic cover will prevent rain from falling on plots. Four irrigation treatments will be studied. (3) Chemical treatments of soil will be tested for effectiveness in preventing pod shedding under two levels of soil moisture. (4) Four varieties of peanuts will be grown under two levels of soil moisture.

2.0365, HYDROLOGIC RELATIONS IN HAWAII

R.R. PULFREY, U.S. Army, Engineer District, *Fort Armstrong - Honolulu, Hawaii* 96813

1. Purpose: To establish criteria for hydrologic design of flood control projects and for plain information studies.

2. Procedure: The investigation involves data collected from a dense network of rainfall and streamflow gages located in three small drainage basins ranging from 4.3 to 6.2 square miles in area. The three areas are: Kalihi Stream - island of Oahu, Wailua Stream - island of Kauai and Kohakohau Stream - island of Hawaii. Continuous record of flow at the three drainage area outlets and two upstream points in two areas is being obtained. Rainfall instrumentation includes 17 recording and 12 non-recording rain gages. The basic data are analyzed to derive general rainfall-runoff relationships which are incorporated into hydrologic design criteria.

3. Progress. Project Bulletin No. 1, printed 30 November 1964, shows the preliminary results of studies in the Kalihi Basin. Collection of data in the Kalihi Basin will be completed at the end of FY-67. The scheduled activity for fiscal year 1968 is the continued collection and analysis of rainfall and streamflow data for the remaining two basins, correlation of physical characteristics of the drainage areas and their effects on runoff, and development of unit hydrographs.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0366, HYDROLOGIC STUDIES (STORM STUDIES) HAWAIIAN ISLANDS

R.R. PULFREY, U.S. Army, Engineer District, *Fort Armstrong - Honolulu, Hawaii* 96813

1. Purpose: To conduct a detailed analysis of selected past Hawaiian Island storms for use in various meteorological investigations including determination of design rainfall for studies or construction involving streamflow.

2. Procedure: a. Part IA consists of compilation of basic rainfall data, construction of mass rainfall curves and preparation of preliminary isohyetal maps by use of isopercentile maps. b. Part IB includes the tabulation of mass curve data, computation of maximum accumulated rainfall amounts at each station by selected time intervals, and the determination of time of occurrence of maximum rainfall for selected durations. A detailed meteorological analysis is prepared by the U. S. Weather Bureau.

3. Progress: Parts IA and IB for storm of 14-16 Apr 63, Island of Oahu; Part IA, 24-27 Jan 56, Island of Kauai; and Part IA, 2-3 Apr 61, Island of Hawaii are complete. Investigation of assigned storms will continue in FY-1968.

2.0368, TRANSPORT PROCESSES IN FLUID FLOWS

A. OGATA, U.S. Dept. of Interior, Water Resources Division, *Honolulu, Hawaii*

Techniques for constructing artificial sandstone models simulating aquifer systems, and using dyes or radioactive tracers to detail dispersion effects in the fluid flow therein, are well advanced. The development of methodology is now pointed toward the determination of those physical parameters of the medium which control the pattern of flow. Because the description requires a knowledge of the path of the fluid particles, the use of tracer methods seems to be the most promising approach. Theoretical study of presently available flow equations will involve the study of the matrix parameters by means of dimensional and inspectional analysis. Laboratory analysis based on theoretical findings and various tracer characteristics is planned. Projected studies will involve progressively more complex media characteristics.

2.0369, GEOPHYSICAL EXPLORATION FOR HAWAIIAN GROUND WATER - PHASE III

W.M. ADAMS, Univ. of Hawaii, Water Resources Research Ctr., *Honolulu, Hawaii* 96822

The adaptation of geophysical exploration procedures and instrumentation to volcanological hydrology, and application of the methods developed to exploiting ground water resources in Hawaii: A. A novel seismic correlation technique using transparent sonograms; B. Seismic holography; C. High voltage (5000 volts) electrical resistivity system for resistivity profiling to delineate ground water sectors and for resistivity sounding to estimate the water table depth in a sector; D. Photometric reflectivity and multispectral photography for surveillance of coastal springs.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Hawaii

2.0370, STUDY OF THE ENERGY BUDGET ON THE HAWAIIAN ISLANDS

J. CHANG, Univ. of Hawaii, Graduate School, *Honolulu, Hawaii* 96822

Incoming radiation, reflectivity of the ground surface, and also its re-radiation will be studied in relation with evapotranspiration.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0371, GEOPHYSICAL EXPLORATION FOR HAWAIIAN GROUND WATER - PHASE II

D.C. COX, Univ. of Hawaii, Water Resources Research Ctr., *Honolulu, Hawaii* 96822

The applicability and further development of several geophysical techniques to ground water exploration problems in Hawaii will be investigated: a) Seismic techniques in relation to detailing lava structure at and below the water table, using signal averaging techniques and vibration inputs and multiple impulses; b) Resistivity surveys in relation to mapping of water-tables and salt fresh water interfaces and location discontinuities between high-head and low-head ground-water bodies; c) Thermal and light sensing in relation to detection and evaluation of coastal spring discharge; d) Electromagnetic sounding in relation to determination of water-table depths in arid areas.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Hawaii

2.0372, PILOT EVAPOTRANSPIRATION STUDY WITH LYSIMETERS OF WATER USE BY SUGAR CANE, PINEAP- PLE AND TROPICAL TRUCK CROPS

P.C. EKERN, Univ. of Hawaii, Agricultural Experiment Sta. ,
Honolulu, Hawaii 96822

Objectives: 1. Develop a hydraulically counter balanced
lysimeter. 2. Develop lysimeters stable against tipping by very tall
crops. 3. Develop lysimeters for use in very heavy rainfall and
with low-transpiring crops.

It is proposed in this project to initiate an investigation of the
effect of water on crop yield and quality of sugar cane, pineapple,
and tropical truck crops, extending earlier research on the mag-
nitude of consumptive use of sugar cane and pineapple. Specifi-
cally in this pilot phase it is proposed to investigate modifications
of semi contained hydraulic lysimeters required to make such
lysimeters suitable for use with Hawaiian crops, taking into ac-
count, for example, the great height of sugar cane, the occasional
periods of very heavy rainfall and the low level of consumptive
use by pineapple.

SUPPORTED BY Hawaii State Government

2.0373, EVALUATION OF THE SULFUR SUPPLYING CAPACITY OF HAWAIIAN SOILS

R.L. FOX, Univ. of Hawaii, Agricultural Experiment Sta. ,
Honolulu, Hawaii 96822

1. To determine the sulfur status of Hawaiian soils and esti-
mate sulfur added in rainfall and irrigation waters. 2. To deter-
mine the sulfur requirement of important crops. 3. To study fac-
tors which influence the availability of soil and fertilizer sulfur.

Soil profile samples will be examined for various sulfur fac-
tions. Crops will be grown on the soils in field and pot culture to
determine the availability of the various forms of soil sulfur. The
sulfur content of rain and air will be determined in relation to
distance and elevation from the sea. Factors which influence the
availability of fertilizer sulfur will be studied.

SUPPORTED BY Hawaii State Government

2.0374, SOIL-WATER RELATIONS OF HAWAIIAN SOILS

R.E. GREEN, Univ. of Hawaii, Agricultural Experiment Sta. ,
Honolulu, Hawaii 96822

1. Determine the soil water retention and conducting proper-
ties of the important agricultural and watershed soils of Hawaii. 2.
Relate soil water retention and conductivity to the structural and
mineralogical properties of soils. 3. Determine the magnitude of
hysteresis in both water retention and capillary conductivity, and
evaluate its importance in soil moisture measurements by suction
techniques for irrigation control purposes.

Soil-water relations of several important Hawaiian soils will
be studied in the laboratory using conventional pressure-mem-
brane equipment to measure soil water retention and a steady-
state flow system to measure capillary conductivity. These studies
will provide (1) necessary data for application of moisture flow
theory to complex infiltration and evapotranspiration problems,
(2) moisture retention information needed for precise soil
moisture control under irrigation, and (3) an evaluation of the de-
pendence of soil-water relations on soil structure and mineralogi-
cal composition.

SUPPORTED BY Hawaii State Government

2.0375, WATER TRACING AND DATING IN HAWAII HYDROLOGIC CYCLE

L.S. LAU, Univ. of Hawaii, Water Resources Research Ctr. ,
Honolulu, Hawaii 96822

It is proposed to investigate the applications of tracer
techniques, principally tritium and radiocarbon, to aid in deter-
mining the age, circulation and movement of water in the Hawaii
hydrologic cycle and particularly that part pertaining to ground
water. This project is to extend and expand a current project
headed by L. S. Lau and L. Barnes, entitled Ground Water Trac-

ing, and jointly supported heretofore by the Water Resources
Research Center, University of Hawaii and Board of Water
Supply, City and County of Honolulu.

Tritium content will be assayed with a liquid scintillation
system with enrichment of samples. Radiocarbon will be likewise
assayed but with benzene conversion. Water sampling will include
ground water, rain water and surface water mostly on Oahu. In-
terpretations of field data will be complemented with considera-
tions of theoretical models.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Hawaii

2.0376, PREDICTION OF WATER MOVEMENT IN UN- SATURATED SOILS

G. UEHARA, Univ. of Hawaii, Agricultural Experiment Sta. ,
Honolulu, Hawaii 96822

1. To investigate the nature of the particle coatings of certain
slowly wetted Hawaiian soils. 2. To investigate the influence of
ionic environment, pH, and moisture content on the wettability of
these soils. 3. To evaluate the factors associated with the develop-
ment of slowly wettable soils.

Description of Work: Investigations on the cause leading to
slow wettability of certain soils and the correction of the property
are the primary objectives of this project. Measurements of such
soil properties as particle size distribution, soil aggregation, ionic
environment, compaction, moisture content and mineralogy by
standard methods and the correlation of those factors with wetta-
bility summarize the nature of this work. In the event wetting pro-
perties of these soils can be improved in the laboratory applica-
tion of the same technique in the field is anticipated.

SUPPORTED BY U.S. Dept. of Agriculture
Hawaii State Government

2.0377, MACADAMIA CULTURE

R.M. WARNER, Univ. of Hawaii, Agricultural Experiment Sta. ,
Honolulu, Hawaii 96822

The project objectives are to: a. Determine the best method
for establishment of macadamia orchards on bauxitic soils, using
heavy lime and fertilizer applications. b. Establish small clonal
orchards of the three principal macadamia varieties on Kauai for
future investigations on cultural practices, including mechanical
harvesting, where none now exist. c. Study the value of supple-
mental irrigation on the establishment of young orchards in a high
but erratically distributed rainfall area. d. Determine the value
and effectiveness of grafting to eliminate bitter nut seedlings from
orchards by means of reciprocal stock and scion grafts. e. Study
on an existing ten- year old clonal orchard at the Waimanalo
Farm, on Oahu, the effects of three levels of supplemental irriga-
tion, heavy, light and unirrigated, on premature nut drop, size,
quality and total yield of macadamia nuts. The three moisture
regimes will be maintained April to October during the critical
period when the main portion of the crop is developing.

Hawaii State Government

2.0378, TIDAL EFFECTS ON GROUND WATER HYDRAULICS IN HAWAII

J.A. WILLIMS, Univ. of Hawaii, Water Resources Research Ctr. ,
Honolulu, Hawaii 96822

It is proposed to study the response of basal ground water
aquifers to tidal fluctuations. Investigation will be limited to
several representative types of aquifer which may be found in the
Hawaiian Islands. The purpose of the study is to verify and
possibly extend existing analytical results through laboratory ex-
periment, to relate laboratory results with field observations, and
finally to determine the relationships between tidal response and
aquifer characteristics (i.e. storage, transmissibility, thickness)
for the aquifers tested.

The basic study will be conducted with hydraulic models in
the laboratory, with analytic or analog techniques used to supple-
ment the model study. A pilot model of simple boundary
geometry for which analytical results are available will be used to
verify the modeling technique.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res.
University of Hawaii

2.0379, PILOT-STUDY OF SMALL WATERSHED HYDROLOGY

I. WU, Univ. of Hawaii, Agricultural Experiment Sta., Honolulu, Hawaii 96822

Objectives: (1) To study the existing rainfall and streamflow data and the instrumentation schemes for obtaining such data. (2) To study the flood damage from small watersheds to agricultural land and urban areas. (3) To review the current design criteria for runoff and flood determination. (4) Design a long term project for determining the rainfall runoff relationships.

Description of Work Proposed: (1) Review, collate, and analyze the existing collections of rainfall, streamflow, and other data pertaining to runoff determination and floods in Hawaii. (2) Study the present instrumentation schemes for obtaining such data. (3) Study and appraise the applicability of formulae and review the current design criteria for runoff determination and flood prevention construction. (4) Develop mathematic equations for flood hydrographs which fit the hydrological situation of the Hawaii Islands.

SUPPORTED BY Hawaii State Government

2.0380, STUDY OF IRRIGATION SYSTEM DESIGN CRITERIA FOR HAWAIIAN VEGETABLE CROPS

I. WU, Univ. of Hawaii, Agricultural Experiment Sta., Honolulu, Hawaii 96822

Objectives: 1. To determine the soil water relations of Lalamilo soils. 2. To determine the soil-water-plant relations. 3. To determine an adequate irrigation practice. 4. Economic analysis of the yield and water use.

Description of Work Proposed: (1st year) 1. Collecting data from pan evaporation. 2. Collecting evaporation data from bare soil surface. 3. Determination of the soil water relations. 4. Study the irrigation pattern, the uniformity of its application. 5. Correlation of pan, soil evaporation to weather variables.

SUPPORTED BY Hawaii State Government

2.0381, PILOT STUDY OF SMALL WATERSHED FLOOD HYDROLOGY IN HAWAII, PHASE II

I.P. WU, Univ. of Hawaii, Water Resources Research Ctr., Honolulu, Hawaii 96822

The proposed research plan is a continuation of the original project. This is designated as phase II.

The primary objectives and scope of the project are 1) to provide fundamental understanding on flood hydrology in Hawaii through analysis and study of existing available precipitation and streamflow data and with limited supplemental studies designed primarily to characterize physiography and land use, and 2) to evaluate the effects on urbanization on flood discharge, and 3) to prepare a research program designed to study rainfall-runoff relationship and design criteria for flood drainage.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res.
University of Hawaii

2.0382, HORTICULTURAL CROP RESPONSE TO IRRIGATION PRACTICES

D.F. WILLIAMS, Univ. of Hawaii, Agricultural Experiment Sta., Waiakoa - Maui, Hawaii

Project objectives 1) Determine the relative advantages of different methods of irrigation for, and the effect of irrigation at different soil moisture tensions on the growth of some major island crops. 2) Relate laboratory measurements of moisture characteristics of the major island soils (Project 133S) to crop growth in the field under different irrigation practices.

Description of work proposed - Replicated plantings of several vegetables and flowers will be overhead irrigated with perforated pipe and surface irrigated with gated pipe (furrow and basin) and canvas trickle hose. Soil moisture and root growth patterns will be followed by, and irrigation based on, measurements from moisture blocks and tensionmeters placed at different depths and distances from the crop row. Crop growth and disease

incidence recordings will be related to irrigation treatment and daily pan evaporation and net radiation readings. Experiments will be repeat planted at different seasons of the year to determine season (day-length, net radiation) - crop response interactions; and on different soil types to determine soil type-crop response interactions, and the relationship of soil moisture characteristics to crop response on different soils. Varietal, plant population and fertility variables will be included wherever experimental design permits.

SUPPORTED BY Hawaii State Government

2.0383, INVESTIGATION OF NEW METHODS (NUCLEAR EQUIPMENT) FOR DETERMINING MOISTURE CONTENTS, AND COMPACTION DENSITIES OF SOILS AND AGGREGATES

H.L. DAY, State Dept. of Highways, Boise, Idaho

This study includes investigating new methods of determining moisture contents and compacted densities of soils and aggregates including the use of nuclear equipment for this purpose.

SUPPORTED BY U.S. Dept. of Transportation - Public Rds.
Idaho State Government

2.0384, EVAPOTRANSPIRATION UNDER NATURAL CONDITIONS

L.M. COX, U.S. Dept. of Agriculture, Boise, Idaho

Object: To study the loss of water by the evaporative process from ponds, irrigated alfalfa and sagebrush rangelands in a semiarid environment; to determine the actual loss of water from representative sites, including the microclimate and soil moisture status; and for predictive purposes to develop a procedure for proportioning the available energy, including advective energy, into sensible heat and latent heat fluxes for wide ranges of soil, vegetation and moisture conditions; and to develop coefficients for estimating actual water loss in terms of the potential evaporation demand.

SUPPORTED BY U.S. Dept. of Agriculture

2.0385, INFILTRATION AS INFLUENCED BY SOIL-VEGETATION COMPLEXES

L.M. COX, U.S. Dept. of Agriculture, Boise, Idaho

To determine the infiltration capacity of the various soil vegetation complexes occurring on a semiarid mountainous watershed under different antecedent moisture conditions and for various levels of intensity and duration; and to develop predictive relationships associating expected infiltration to soil and vegetation properties, soil temperature and moisture status; and meteorological factors.

Plan of Work: This work is in progress on the Reynolds Creek Experimental Watershed southwest of Boise, Idaho. A rainfall will be used to evaluate site infiltration on the various soil-vegetation complexes that have already been delineated.

SUPPORTED BY U.S. Dept. of Agriculture

2.0386, PRECIPITATION CHARACTERISTICS INFLUENCING HYDROLOGIC PERFORMANCE OF AGRICULTURAL WATERSHEDS IN THE PACIFIC NORTHWEST

W.R. HAMON, U.S. Dept. of Agriculture, Boise, Idaho

Object: To develop methods for evaluating precipitation for an area, both with respect to rates and amounts; to determine seasonal variations in precipitation types and amounts, storm duration, intensity and areal extent expectancies; to determine pertinent characteristics of precipitation with respect to runoff and sediment movement; and to evaluate the characteristics of the snowpack producing storms.

Plan of Work: The work is carried on principally in the Reynolds Creek Experimental Watershed southwest of Boise, Idaho, by means of a network of recording raingages and snow courses for precipitation measurements. Some aspects of the studies are in progress from headquarters in Moscow, Idaho.

SUPPORTED BY U.S. Dept. of Agriculture

2.0387, RUNOFF AND SEDIMENT MOVEMENT ON UNIT SOURCE WATERSHEDS OF THE PACIFIC INFLUENCED BY CLIMATE, SOILS, VEGETATION AND TOPOGRAPHY
W.R. HAMON, U.S. Dept. of Agriculture, Boise, Idaho

Object: To develop methodology and criteria for characterizing soil-vegetation-geologic complexes; to evaluate the effects of these complexes on storm runoff, water yield and sediment movement; to determine the effects of these complexes on deposition and melt of snow and evaluate the interrelations of climatic factors with these complexes; and to develop criteria for judging areas of high water yield, storm runoff, and sediment production from known parameters.

Plan of work: This work is in progress on the Reynolds Creek Experimental Watershed southwest of Boise, Idaho. Various soil vegetation-geologic complexes have been delineated and instrumented intensively to measure precipitation; sediment yield; temperature, radiation; wind; slope; watershed shape, size, and exposure; amount and kind of vegetation; kind of soil and rock; snow density and depth; height and distance of obstacles to wind and snow, and other factors which may be pertinent.

SUPPORTED BY U.S. Dept. of Agriculture

2.0388, SNOW ACCUMULATION AND MELT ON STUDY AREAS
F.M. SMITH, U.S. Dept. of Agriculture, Boise, Idaho

To determine the physical and meteorological factors contributing to nonuniformity of snow accumulation in shrub-covered study basins on mountainous terrane; to determine the influence of the controlling physical and meteorological factors on snowmelt from the above areas.

Plan of Work: This work is in progress on the Reynolds Creek Experimental Watershed southwest of Boise, Idaho. A photogrammetric technique is being used to describe the basic land and snow surfaces with such precision that it is possible to analyze accumulation and melt patterns over the entire study area. An energy balance at the snow-surface is also used to evaluate the melt rate.

SUPPORTED BY U.S. Dept. of Agriculture

2.0389, FUNDAMENTAL ASPECTS OF WATER EROSION IN THE PACIFIC NORTHWEST
M.E. JENSEN, U.S. Dept. of Agriculture, Kimberly, Idaho

Object: To determine the causative factors of water erosion and the processes by which soil materials are removed and transported by water; to develop suitable methodology and devices for studying water erosion phenomena; and to determine effects of various soil, crop, land surface, topography, and climatic factors on infiltration and water erosion in the Pacific Northwest.

Plan of Work: Work under this project employs devices such as rainfall towers, portable field rainulators, and extensive field and laboratory plot control equipment for application of rainfall under specified conditions. Development of such research tools is a part of this activity. Control of climate including freezing and thawing of experimental plots, both prior to and during water application tests, as well as fixed control of soil variables by controlled tillage, crop residues, and other management factors permit development of basic relationships between various soil, cover, and climatic factors and the phenomena of soil loss by water erosion. The infiltration and water transmission in frozen or partially thawed soil is under investigation.

Cooperation: Washington Agricultural Experiment Station; SCS; and others.

SUPPORTED BY U.S. Dept. of Agriculture

2.0390, SIMULATION MODEL FOR EVALUATION OF INTERCEPTION FROM FOREST TREES
G.H. BELT, Univ. of Idaho, Graduate School, Moscow, Idaho 83843

Digital simulation models expressing the mechanisms controlling accumulation and depletion of intercepted snow from single trees will be developed. The models will reflect both meteorological and vegetational parameters influencing the interception process. The validity of the models will be tested using experimental data gathered by the Principal Investigator and obtained from the literature.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res. University of Idaho

2.0391, EFFECT OF PHYSICAL PROPERTIES OF POROUS MEDIA ON WATER MOVEMENT
G.L. BLOOMSBURG, Univ. of Idaho, School of Engineering, Moscow, Idaho 83843

The work will involve a numerical solution of the Navier Stokes equations for flow around arrays of particles. The numerical solution for the velocity and pressure distributions will be compared to experimental results. Another portion of the project will consist of relating the permeability of porous media directly to physical properties of the media -- such as porosity and particle size -- with no undefined shape or orientation factors. This portion of the project will consist largely of review of existing theories and experimental work.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res. University of Idaho

2.0392, EFFECT OF EXTERNAL AIR PRESSURE ON LIQUID FLOW THROUGH A POROUS MEDIUM
G.L. BLOOMSBURG, Univ. of Idaho, Agricultural Experiment Sta., Moscow, Idaho 83843

Objectives: (1) To determine the effect of external pressure on the liquid permeability of a porous medium containing trapped air. (2) To determine the effect of external pressure on the amount of trapped air.

There is evidence from several field studies of canal seepage that there is a relationship between atmospheric pressure and permeability due to trapped air in the soil. In this laboratory study the relationship will be studied as well as the effect of pore size and atmospheric pressure on the amount of trapped air. The porous media used will be glass beads packed into a plastic column approximately 1 1/4 inches in diameter and 2 feet long. A hydrocarbon liquid or water will be used as the flowing liquid.

SUPPORTED BY U.S. Dept. of Agriculture
Idaho State Government

2.0393, DISTRIBUTION AND ECOLOGY OF AQUATIC INSECTS OF IDAHO
M.A. BRUSVEN, Univ. of Idaho, Agricultural Experiment Sta., Moscow, Idaho 83843

Objectives: (1) Inventory the aquatic insects of Idaho to determine their distribution and abundance. (2) Study the biology of the aquatic insects of Idaho for the purpose of determining their life histories, ecological habitats, inter- and intra-specific relationships with other animals, parasites and predators, food habits, and importance to man and domestic animals. (3) Study the population dynamics of insects in selected aquatic habitats in order to determine and evaluate the biological and physical effects of the environment on the population.

The purpose of this study will be to determine the fauna, distribution, biology and ecology of aquatic insects in streams, lakes, ponds, reservoirs, drainage and irrigation ditches in Idaho. Various techniques for collecting in different habitats will be employed such as bottom scrapers, Surber bottom samplers, aquatic seines, nets and dredges in order to ascertain both qualitatively and quantitatively the insect fauna. An evaluation will be made of water chemistry, substrate, depth of water, turbidity, temperature, food and inter- and intraspecific relationships in order to determine their effects on the distribution and population dynamics of aquatic insects. Laboratory rearing studies in aquaria and tanks will supplement field data in delineating the bionomics, life histories, and role of insects in the aquatic ecosystem.

2. WATER CYCLE

Idaho State Government

2.0394, NON-STEADY 2 AND 3-DIMENSIONAL FLOW OF FLUID INTO POROUS MATERIAL

G.L. COREY, Univ. of Idaho, Agricultural Experiment Sta. ,
Moscow, Idaho 83843

Objectives: (1) To investigate possible approximate solutions for the differential equation describing non-steady 2 and 3-dimensional flow of a fluid into a porous material. (2) To determine experimentally the relationships between discharge, advance of the wetted front, and time when a fluid enters a porous material at a capillary pressure sufficiently high to eliminate complete saturation near the source. (3) To determine the effect of initial moisture content on the above relationships.

The diffusion approach toward flow into porous media has been thoroughly investigated for one-dimensional flow, however information is very limited concerning the more important 2 and 3-dimensional flow cases. Relationships between discharge, rate of advance and time will be experimentally determined. The fluid will be forced to enter the material at a tension so that the diffusion equation will be truly tested. The effect of initial moisture content on imbibition will be determined. An attempt will be made to solve with analog techniques the differential equation describing this flow so that the analytical solution can be compared with the experimental data.

SUPPORTED BY U.S. Dept. of Agriculture
Idaho State Government

2.0395, INTERACTION OF TEMPERATURE WITH OTHER FACTORS ON THE RESPONSE OF CANADA THISTLE TO HERBICIDES

L.C. ERICKSON, Univ. of Idaho, Agricultural Experiment Sta. ,
Moscow, Idaho 83843

Objectives: (1) To determine the influence of two nitrogen, phosphorus, moisture and temperature regimes on the growth and reproduction of Canada thistle *Cirsium arvense* L. (2) To determine the influences of these factors on the efficiency of moisture utilization of thistle growth (weight). (3) To determine the influences of these factors on the response of this species to herbicides.

This study will be conducted primarily in the greenhouse using individual plant containers. The growth media will be a N and P deficient sandy loam soil. Nitrogen and P₂O₅ will be added at 0 and 100 lbs equivalent/A. Moisture will be maintained at 1/3, and 1 atmosphere. A temperature difference of 10° F. will be maintained for 14 days before and following the herbicide application.

Prior to the herbicide applications two harvests will be made to determine the influences of fertility, and moisture on subsequent growth. Final phytotoxic effects will be determined by survival, date and vigor of re-growth, and finally plant weight.

SUPPORTED BY U.S. Dept. of Agriculture
Idaho State Government

2.0396, EVALUATION OF CLIMATIC PATTERNS AFFECTING IDAHO AGRICULTURE

D.O. EVERSON, Univ. of Idaho, Agricultural Experiment Sta. ,
Moscow, Idaho 83843

Objectives: (1) To complete the recording on punch cards of weather data from selected locations within Idaho. (2) To analyze precipitation data to determine the probabilities of receiving specified amounts of precipitation for weekly periods and three-week moving averages of these periods for each of the selected locations. (3) To determine whether there exist any detectable changes in precipitation and temperature normals over years when such data are available. (4) To analyze evaporation data during the growing season to establish its variation and range.

The limiting climatic factors influencing production in the agricultural regions of Idaho should be more clearly defined by statistical evaluation of weather records. Data spanning a thirty

year period for about 15 weather stations are sufficient for this description. Precipitation data are not normally distributed, however use of the gamma distribution permits calculation of the probabilities of receiving given amounts of rainfall. Means and standard deviations of weekly temperatures, growing degree days and evaporation will adequately describe these climatic factors for use in making intelligent agricultural decisions.

SUPPORTED BY U.S. Dept. of Agriculture
Idaho State Government

2.0397, NORTHERN IDAHO ALFALFA PROBLEM

R.W. HARDER, Univ. of Idaho, Agricultural Experiment Sta. ,
Moscow, Idaho 83843

Objectives: A. Determine if root growth is being limited by soil conditions to the degree that they do not function properly in assimilating available nutrients and moisture from the soil. B. Determine if the soil conditions influence nutrient availability by affecting the chemistry of the soils. C. Determine the soil moisture movement pattern to find out if soil conditions are impeding water movement in such a way that the roots are unable to get an adequate supply of water or oxygen. D. Determine if physical conditions of the soil are affecting microbial activity. This study will be made on undisturbed soil cores, disturbed samples and on field plots on soils under virgin forest, and in areas where both normal and 'sick' alfalfa is growing. Detailed morphological, moisture movement pattern, nutrient uptake, and root growth studies will be made on both normal and 'sick' alfalfa sites in situ. Physical analysis of soil structure will be made in the laboratory. Various physical and chemical treatments will be made on core and disturbed soils and alfalfa growth habits will be studied. Chemical characterization of 'sick' and normal soils and alfalfa plants from these soils will be made. Microbial response to modification of physical and chemical properties of the soil in the field and greenhouse will be studied.

SUPPORTED BY Idaho State Government

2.0398, LIMNOLOGICAL STUDIES OF LENTIC WATERS IN IDAHO

F.W. RABE, Univ. of Idaho, Water Resources Research Inst. ,
Moscow, Idaho 83843

Four alpine lakes in the Five Lakes Butte Area in northeastern Idaho will be studied together with a reservoir located outside of McCall, Idaho which is scheduled for filling during the fall of 1966. Objectives are to determine the physical and chemical characteristics of the waters during the summer and limited samples during the winter, to measure primary production of the phytoplankton in the reservoir waters, to measure secondary production in both high lakes and reservoirs as pertains to zooplankton and macro-invertebrates, and to relate fish production with the biotic parameters measured in the high lakes. Limnological measurements of the newly impounded reservoir water over the years will help make it possible to compare production over a period of time. These observations will be related to the growth and condition of the fish populations.

At least three graduate students will help conduct these studies. Such limnological measurements will enable us to learn more about lentic water production and carrying capacity of the waters and thus help establish a reliable fish stocking program.

University of Idaho

2.0400, TEMPORAL, HORIZONTAL AND VERTICAL VARIABILITY OF WATER CHEMISTRY IN THE UNSATURATED ZONE OF FINE-GRAINED SOILS

R.E. WILLIAMS, Univ. of Idaho, Water Resources Research Inst., Moscow, Idaho 83843

The first phase of the project consists of the development of a method whereby many samples of soil water can be obtained from a given point in the zone of aeration. A sampling point will not be destroyed during the sampling process, thus temporal variation of water quality at any given point in the soil can be determined by analysis of samples collected over an extended period of time. In the second phase, the horizontal and vertical variability of water quality at several different times will be determined by analysis of samples collected from a network of points in the unsaturated zone in fine grained soils. Determination of temporal, horizontal and vertical variability of water quality should provide insight into rate and direction of movement of water in the unsaturated zone as well as information on the quality of the water recharging ground-water aquifers.

2.0401, SOIL-PLANT-ATMOSPHERE COMPONENTS IN IRRIGATION STUDIES OF BLACK WALNUT TREES IN SOUTHERN ILLINOIS

W.C. ASHBY, Southern Illinois University, Graduate School, Carbondale, Illinois 62903

The overall objective is to identify soil, plant, and atmospheric factors influencing irrigation requirements and resulting growth of black walnut on a small watershed in southern Illinois.

Individual investigators' research objectives include: 1. Study of the relations between leaf water potential, stomatal conditions, leaf temperature, and soil moisture conditions. 2. Determination of a suitable empirical basis for enabling future walnut irrigators to estimate carefully the need for irrigation. 3. Ascertainment of the influence of varying soil moisture tensions on measured transpiration rates of black walnut.

SUPPORTED BY Southern Illinois University

2.0402, SORPTION ISOTHERMS OF PHENOL ON ION EXCHANGE RESINS

J.W. CHEN, Southern Illinois University, School of Engineering, Carbondale, Illinois 62903

Phenol is a troublesome pollutant from industrial wastes, it cannot be removed by biological treatment easily. Ion Exchange Resins are proposed as potential adsorbents to remove phenol because their selectivity and capacity.

Five different resins were screened. It was found that both IR 45 and IR 401 resins are excellent adsorbents for phenol. Sorption isotherms of these two resins at different pH and temperatures are investigated.

SUPPORTED BY Southern Illinois University

2.0403, THE EFFECTS OF PLANT TRANSPIRATION RETARDANTS ON TRANSPIRATION, LEAF TEMPERATURE, STOMATAL BEHAVIOR AND OSMOTIC PRESSURE

N.A. MILLER, Southern Illinois University, Graduate School, Carbondale, Illinois 62903

The objective of this research is the study of the effects of plant transpiration retardants on leaf temperature, stomatal behavior, osmotic pressure, water potential, turgor pressure and transpiration on field corn (*Zea mays*) grown under field conditions and greenhouse conditions.

In the field, measurements and collections will be made every four hours starting at 6 AM until 10 AM the following day. Leaf temperatures will be recorded using a copper-constantan thermocouple with a DC rustrak amplifier-recorder system. Stomatal behavior will be noted with General Electric RTV-11 silicone impressions and a microprojector. The osmotic pressure of the leaves will be determined with a Fiske Osmometer and water

potential (DPD) with the Schardakou method. The turgor pressure will then be determined from this data (OP-DPD0TP). Similar collections will be carried out in the greenhouse including the gravimetric determination of transpiration rates.

Control and treated plants will be studied simultaneously. Retardants to be used include phenylmercuric acetate (different concentrations), chlorogenic acid, n-decenylsuccinic acid, and hexadecyl and octadecyl alcohols.

SUPPORTED BY Amer. Assn. For The Advancement of Sci.

2.0404, EFFECT OF SOIL MOISTURE AND POTASSIUM FERTILIZATION ON THE TRANSPIRATION RATE OF SOYBEANS (GLYCINE MAX)

J.P. VAVRA, Southern Illinois University, School of Agriculture, Carbondale, Illinois 62903

The objective of this project is to study the effects of varying concentrations of potassium and different soil moisture levels on soybean growth and transpiration. The experiment will be conducted in the greenhouse and in the field.

SUPPORTED BY Southern Illinois University

2.0405, DAILY HEAT BUDGETS IN ENVIRONMENTAL FLUIDS

J. VERDUIN, Southern Illinois University, Graduate School, Carbondale, Illinois 62903

The diurnal heat gain and nocturnal heat loss in aquatic environments and in the atmosphere is under investigation. Heat budgets are expressed in terms of calories per cm² per day and the distribution at different levels in water and air is being determined. The aquatic investigations are confined to habitats in Illinois and Ohio, but atmospheric data extend from tropical to polar stations.

SUPPORTED BY Southern Illinois University

2.0406, SCAVENGING STUDY OF SNOW AND ICE CRYSTALS

A. LIEBERMAN, IIT Research Institute, Chicago, Illinois

A research program is described to study the important factors for defining scavenging effectiveness of snow and ice crystals. Two factors of concern are the aerodynamic and the electrostatic forces between the falling crystal and the particles or droplets in its path. The differences between the forces associated with the crystal and those associated with an equivalent droplet are to be considered.

The forces should be investigated first independently, and then in combination. Both analytical and experimental studies are planned, with the ultimate objective of better defining the parameters controlling scavenging by snow and ice crystals. During the first year efforts will be directed primarily toward study of aerodynamic effects.

2.0407, DYNAMICS OF THE CIRCULATION IN THE GREAT LAKES

G.E. BIRCHFIELD, Northwestern University, School of Engineering, Evanston, Illinois 60201

The overall objective of this work is to make a study of the dynamics of the circulation in the Great Lakes. The circulation of the Lakes may be caused by several factors. Certainly one of the primary forcing functions is the wind and temperature fields of the atmosphere overlying the lakes. The proposed research is subdivided into two major tasks.

The first task is to consider a numerical model of the combined Lake Huron, Lake Michigan basins as a single basin connected by the Straits of Mackinac. Horizontal transport will be calculated for a field of constant stress, a field of constant curl stress and a field of constant divergence stress. It is anticipated that bounds can be established on the exchange of mass between the lakes as a function of wind stress.

The second task concerns the distribution of wave energy in a lake. It is proposed to investigate the normal energy modes for a

2. WATER CYCLE

two-layer circular lake with a parabolic depth profile. Some information will be obtained as to the distribution of energy among the normal modes in response to a simple stress field. Such a study will assist in determining the relative importance of the modes as a function of the forcing period. It is planned to estimate the normal modes numerically for a Lake Michigan model.

2.0408, A STUDY OF A POLLUTED RIVER, THE ILLINOIS

W.C. STARRETT, State Dept. of Conserv., Springfield, Illinois

Objective: The Illinois River, originating below Chicago and flowing southwestward to enter the Mississippi River at Grafton, has a long history of pollution, much of which has been documented (since 1900) by Survey aquatic biologists. At present there is a move on by the State and Federal Governments to clean up the pollution. Our investigation will measure the progress that is being made and suggest the sources of the more severe types of pollution based on the reactions of the fishes and aquatic invertebrates.

Procedures: Biological collections are made at specific stations with trap nets, a boat shocker, and using minnow seines for small fishes. These collections are paralleled by limited chemical sampling and dissolved oxygen profiles. Dredges are used to collect deep water specimens and molluscs. Collections of invertebrates and small fishes are preserved and returned to the laboratory for identification. These procedures will be followed each summer and fall for three additional years.

2.0409, INVESTIGATION OF PERMEABILITY OF FINE GRAINED GLACIAL SEDIMENTS IN RELATION TO WASTE DISPOSAL IN ILLINOIS

R.E. BERGSTROM, State Geol. Survey, Urbana, Illinois

The objective of the research is to evaluate current methods and to develop practical procedures for determining the field permeability of fine grained glacial sediments. These sediments -- mainly tills -- are too tight to be analyzed for permeability on the basis of conventional pumping tests. Field measurements will be made using several methods of injection -- and possibly pumping -- in shallow bore holes. Laboratory tests will be made on cores by standard permeameter methods.

The permeability data will be obtained from representative glacial deposits of known character and extent, so that results may be extrapolated, and will be evaluated for such practical applications as selecting sites for surface waste disposal, protecting shallow aquifers from pollution, and appraising drainage and ground-water recharge conditions.

2.0410, THEORETICAL ANALYSIS OF REGIONAL GROUND-WATER FLOW IN THE HAVANA AREA

P.C. HEIGOLD, State Geol. Survey, Urbana, Illinois

A study of the flow system of the Havana Area, a broad sand plain adjacent to the Illinois River, has been undertaken, using numerical methods adapted for computer solution. A mathematical model representing three dimensional, non-homogeneous, isotropic, steady state flow has been developed. Input data, such as water tables, bedrock elevations, and hydraulic conductivity values, have been taken from a hydrogeologic report of the area and additional data sources of the Illinois State Geological Survey and the Illinois State Water Survey. Output includes the regional potential distribution in the glacial deposits between the water table surface and the Pennsylvanian and Mississippian bedrock which is assumed to be impermeable. The mathematical model is general enough to be applied in other areas where the basic conditions are met.

2.0412, TOPOGRAPHIC EFFECTS ON PRECIPITATION

S.A. CHANGNON, State Water Survey, Urbana, Illinois

An extensive study of the increased precipitation in the Shawnee Hills area of southern Illinois is underway. Data from the raingage installations will be used to identify the specific areas of the hills where the topographic effects maximize. This will allow further instrumental studies of the changes produced in the low-level atmosphere by the relatively small hills.

Data collection for the first five-year phase of project began January 1, 1965; analyses will be continuous throughout the program.

SUPPORTED BY Illinois State Government

2.0413, INTERRELATIONSHIP OF FACTORS AFFECTING QUALITY OF IMPOUNDED WATERS

R.L. EVANS, State Water Survey, Urbana, Illinois

A study of water quality in lakes is being made in an effort to obtain knowledge concerning the interrelationship of physical, chemical, and biological processes occurring in an impounded water. Initial study on Lake Bloomington include comparison of quality characteristics in tributaries with those of water withdrawn from the lake to measure changes occurring in the impoundment. Chemical analyses are performed on waters of the lake, its tributaries, muds and squeeze water and interface liquor. Phytoplankton and bottom fauna are collected and identified, temperatures and dissolved oxygen measured, and secchi disc readings are recorded.

2.0417, GEOHYDROLOGIC SYSTEM ANALYSIS WITH AN ELECTRIC ANALOG COMPUTER

T.A. PRICKETT, State Water Survey, Urbana, Illinois

Electric analog techniques have now been devised and tested for simulating nearly all active and passive boundary conditions which are common to all groundwater systems. Within the last year, emphasis was placed on final design of the necessary circuits needed to simulate the nonlinear properties of evapotranspiration, induced infiltration from rivers, aquifer storage, groundwater runoff, recharge from precipitation, and underflow.

Also, a report is currently being written which describes various finite-difference networks for both electric analog and digital simulation of aquifer systems. Methods are outlined for designing several types of equivalent discretized aquifer systems which result in a minimum number of simultaneous equations that need to be solved for a given problem solution. Special network designs are given that allow a great reduction in the size of an analog model and in programming or data input in the case of digital simulation. Error analysis has been included to guide the investigator in design of such networks.

SUPPORTED BY Illinois State Government

2.0418, GROUND-WATER STUDIES - PILOT DRAINAGE BASIN STUDY

R.J. SCHICHT, State Water Survey, Urbana, Illinois

All factors of the hydrologic cycle (especially precipitation, temperature, streamflow, soil moisture, changes in surface and sub surface storage, and evaporation) are being measured and examined to obtain quantitative knowledge of movement and storage of ground water under natural conditions in 22-square mile basin (East Branch, DuPage River, in Chicago Region).

The annual rate of recharge to, and evapotranspiration from, the ground-water reservoir is to be determined. Stream discharge hydrograph is being separated into its two components, surface runoff and ground-water runoff. Gravity yields of glacial deposits and underlying dolomite aquifer to be estimated.

First phase completed October 1966; to be renewed in future to study effect of land-use changes (rural to suburban); skeleton observation network being maintained in interim.

SUPPORTED BY Illinois State Government

2.0419, GROUND-WATER STUDIES - DEEP SANDSTONE AQUIFER IN CHICAGO REGION

R.J. SCHICHT, State Water Survey, Urbana, Illinois

Investigations cover extensive artesian well field with wells 1200 to 2200 feet deep, locally heavily pumped (pumpage in 1961 was 96.5 million gallons per day, and has exceeded practical sustained yield of aquifer since 1958); includes study of ground-water level recession, interferences, transmissibilities, effect of additional demands; water-level and pumpage data are analyzed annually.

SUPPORTED BY Illinois State Government

2.0420, STREAMFLOW HYDROGRAPH SEPARATION

R.J. SCHICHT, State Water Survey, Urbana, Illinois

In this study, separation of the streamflow hydrograph into its components of surface runoff and groundwater runoff is based on

differences in the total dissolved minerals in groundwater and in surface water as measured by the conductivity method. An earlier study was conducted on the Pilot Drainage Basin (East Branch DuPage River, in Chicago Region); however, sewage effluent in this river during parts of the year affected the results. A second study has been started on the 95-square-mile Panther Creek watershed (central Illinois). Here, separation of the streamflow hydrograph by the conductivity method will be compared with the rating curve method of relating mean groundwater stage to groundwater runoff, since a rating curve for Panther Creek was previously established.

SUPPORTED BY Illinois State Government

2.0421, STREAMFLOW VARIABILITY

K.P. SINGH, State Water Survey, Urbana, Illinois

Basic research into the inherent variability of streamflow is being pursued. This study is currently oriented toward improving knowledge of the actual yield of an impounding reservoir during critical drought conditions.

Understanding the variability of streamflow provides fundamental knowledge which will be useful in processing Illinois streamflow to provide answers to many questions in areas of: water supply direct from streams, drainage, duration of low flows and high flows, zoning of flood plain land, and to some extent floods.

2.0426, EFFECT OF WATER AVAILABILITY ON PHOTOSYNTHESIS OF PLANTS

J.S. BOYER, Univ. of Illinois, Graduate School, Urbana, Illinois

The proposed research deals with the effect of water availability on photosynthesis and its implications for increasing the efficiency of water use by crops. The investigations will center on means of measuring crop moisture status and the reasons for changes in photosynthesis at various plant moisture stresses. Three studies will be carried out: 1. A simple field method will be developed to measure the moisture status of corn and soybean crops. 2. The method will be used in conjunction with measurements of photosynthesis of corn and soybeans to determine the moisture status at which these crops require water. Measurements of moisture status and photosynthesis will also be made in plants recovering from water deficiencies to determine whether the method can be used to indicate when sufficient water has been applied during irrigation of corn and soybeans. 3. Experiments will be undertaken to elucidate mechanisms by which lack of moisture may reduce photosynthesis. Chloroplasts will be isolated from leaves which are subjected to water deficiencies and will be studied for evidence of structural damage as well as changes in enzymatic activity brought about by the deficiency conditions.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Illinois

2.0427, SYSTEM ANALYSIS OF RAINFALL-RUNOFF RELATIONSHIP

V.T. CHOW, Univ. of Illinois, School of Engineering, Urbana, Illinois

The watershed is treated as a lumped hydrologic system. Assuming a general nonlinear equation for the basin storage and combining it with the equation of continuity, a differential equation for the system has been formulated. This equation has been quasi-linearized by assuming that the coefficients are functions of the average inflow and outflow of the system. Without resorting to the quasi-linear procedure, the nonlinear equations are now being solved on digital computers.

SUPPORTED BY University of Illinois

2.0428, STOCHASTIC ANALYSIS OF RAINFALL-RUNOFF RELATIONSHIP

V.T. CHOW, Univ. of Illinois, School of Engineering, Urbana, Illinois

Stochastic behavior of rainfall-runoff relationship has been investigated by employing sequential generation and simulation techniques to the analysis of the data from 28 annual storms in the French Broad River Basin at Bent Creek, North Carolina. The stochastic process was formulated by Markov-chains and Monte Carlo methods, assuming deterministic watershed system. The watershed system itself, in addition to the stochastic input rainfall and stochastic output runoff, is now being considered as stochastic in the analysis.

SUPPORTED BY University of Illinois

2.0429, HYDROLOGIC ANALYSIS BY ANALOG COMPUTERS

V.T. GHOW, Univ. of Illinois, School of Engineering, Urbana, Illinois

Direct and indirect analog computers are used for the analysis of hydrologic systems of surface and ground waters. For linear and nonlinear reservoirs, floods have been routed through them by simulation of EAI PACE computers. The results indicated that the initial storage in the reservoir affects only the very beginning portion of the outflow hydrograph. For investigating ground water potentials, resistance networks have been designed and analyzed for a number of ground water regions in Illinois.

SUPPORTED BY University of Illinois

2.0430, GROWTH AND DEVELOPMENT OF NATIVE HARDWOODS AND PINE

A.R. GILMORE, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

(1) To work out site index curves for both hardwood and pine on the basis of site factors; (2) to establish timber productivity classes for the important soil types or series; (3) to study the growth or various species in relation to factors that effect the availability of soil moisture; (4) to investigate the relation between site and mineral content of the foliage of both pine and hardwood species.

Description of Work: Microdendrometer studies will be used to determine the influence of various site factors, soil moisture in particular, on the seasonal growth of pine plantations and native hardwood stands. They will be used also to study the effects of the release of trees from competition on diameter growth.

An intensive study of site-growth relationships in native hardwood stands will be made on soil types important to timber-growing in southern Illinois. The foliar analysis for N., P., K., Ca., and other elements will be made on leaf samples taken from hardwood trees growing on different site qualities. Nitrogen determination will be by micro-kjeldahl methods. Other elements will be determined with a flame photometer.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Agriculture
Illinois State Government

2.0431, EFFECTS OF SOIL MOISTURE STRESS

A.R. GILMORE, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Objectives: To investigate the effects of controlled soil moisture stress on (1) foliar nutrients, number of growth flushes, diameter growth, and height growth of loblolly pine trees. (2) The specific gravity; tracheid length; and percentage of summerwood, springwood, cellulose, extractives, and lignin of the wood of loblolly pine trees.

Procedure: Plots in an 18-year-old plantation of loblolly pine will be subjected to six soil moisture stresses and replicated three times in a randomized block design. Soil moisture will be monitored with a d/M nuclear gauge. Micro-environment stations will be maintained. Radial growth will be recorded by dendrograph.

At the end of the experiment, wood will be analyzed for cellulose, lignin, nutrients (nitrogen, potassium, etc.) and any other chemical component by accepted A.O.A.C. procedures.

2.0432, A WATER TRANSPORT IN THE SYSTEM, SOIL-PLANT-ATMOSPHERE

A. KLUTE, Univ. of Illinois, School of Agriculture, Urbana, Illinois

This is to be an experimental study of the uptake of water by plant root systems under controlled conditions. Plants will be grown in soil columns with provision for temperature and humidity control of the top of the plant. Evaporation from the soil surface, and from the leaves of the plant will be measured separately. Data will be collected to supply the necessary parameters in a theory of water uptake based on the use of unsaturated flow theory including a sink-term in the flow equation.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Illinois

2.0433, INVESTIGATION OF WATER STORAGE AND MOVEMENT IN SOILS

A. KLUTE, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Objectives: (1) The development of new and improvement of old concepts of the behavior of water in soils, especially unsaturated soil. (2) The development and improvement of methods of measuring soil properties that are significant in water storage and movement. (3) Application of the theory of flow to analyze various soil water flow systems and obtain predictions of their behavior.

Work Proposed: Solutions of the flow equation for water in unsaturated soil will be obtained for various specific flow systems. Experimental observations on these flow systems will be compared with these solutions. Methods of measuring conductivity and water capacity will be developed and improved. Attempts to extend the flow theory to deformable soils will be made.

SUPPORTED BY U.S. Dept. of Agriculture
Illinois State Government

2.0434, HYDROLOGIC CHARACTERIZATION OF SMALL WATERSHEDS

A. KLUTE, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Regional Objective: To investigate the use of mathematical, electrical, and hydraulic models to study hydrologic phenomena of watersheds.

Specific Objectives: 1. To analyze the flow behavior of water in a soil with a sloping surface during three stages of flow: (1) wetting under rainfall, (2) steady flow under rainfall, (3) drainage after rainfall has ceased, and to determine the contribution of subsurface flow to the runoff from the land. 2. To predict the soil water content, hydraulic head and pressure head of the soil water

as a function of time and position in the soil. 3. To predict the flow rate across the soil surface as a function of time and position on the slope during each of the three stages of flow.

Work Proposed: Numerical solutions of the flow equation for water in soil will be obtained for boundary and initial conditions that will represent wetting of a soil on a slope, the steady flow through the soil and the drainage of the soil after rainfall ceases. The contribution of the soil water flow to runoff will be evaluated, and the effect on the flow of various parameters, such as slope length, slope angle, and soil properties, will be evaluated.

SUPPORTED BY U.S. Dept. of Agriculture
Illinois State Government

2.0435, STUDY OF THE HYDROLOGY FOR MODELS OF THE GREAT LAKES

D.D. MEREDITH, Univ. of Illinois, School of Engineering, Urbana, Illinois

Sophisticated quantitative analyses of precipitation, evaporation, and runoff for each of the Great Lakes and the Great Lakes as a system are proposed in order to provide a better understanding of these relationships for future management of the Great Lakes. Monthly estimates will be derived, based upon a thorough meteorologic and hydrologic evaluation of all existing data. These water movement data are necessary for a quantitative systems analysis of the Great Lakes for future management.

In order to perform these tasks it will be necessary to gather into one analysis site all of the existing runoff and precipitation data as well as other pertinent meteorological data from United States and Canadian sources. The accumulated data will be used to make monthly and annual estimates of runoff, precipitation, and evaporation for lakes on an individual basis for the period 1945-1965 with some consideration given to the drought period of the 1930's. The monthly estimates will be available for future use through publication in the appropriate journals.

SUPPORTED BY University of Illinois

2.0436, CLAY-WATER-ION INTERACTIONS

R.J. MILLER, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Objectives: (1) Evaluate the effect of clay adsorbed water on the water flow characteristics of a clay-water system. (2) Determine the influence of temperature on the physical nature of water in association with clays. (3) To investigate the effect of various treatments and ions on the surface characteristics of clays.

Work Proposed: Experiments will be conducted to elucidate the effect of clays and exchangeable cations on the structure of water adsorbed on clay surfaces. A combination of experimental observations and current ideas on water structure may lead to a better understanding of the mechanisms involved in clay adsorbed water.

2.0437, AN EXPERIMENTAL STUDY OF EDDY DIFFUSION COEFFICIENTS, EVAPOTRANSPIRATION AND WATER USE EFFICIENCY

R.J. MILLINGTON, Univ. of Illinois, School of Agriculture, Urbana, Illinois

Work at Porton has shown the utility of artificial line sources in measuring eddy diffusion coefficient profiles for mass transfer in the lower atmosphere. It is proposed to extend this approach to measurement of profiles of eddy diffusion coefficients within and above the leaf canopy of crop plant communities.

A line source of organic vapor will be introduced into both wind tunnel model systems and into field crops. Concentration distribution downwind will be estimated on gas samples, pumped from sample points to a collection site, where analysis will be made using a gas chromatograph flame ionization detector.

Measurement of wind speed at one height together with concentration distribution data, permits finite difference numerical analysis of the usual two-dimensional flow equation involving both convective and eddy diffusive terms. Alternatively, by using

2. WATER CYCLE

sources at different heights and measuring at short distances downwind, separate estimates of the eddy diffusivity can be made within 'layers' of the system, using a graphical solution of the flow equation.

The eddy diffusion coefficient profiles thus obtained, when augmented with measures of the profiles of water vapor pressure and carbon dioxide, allow calculation of evapotranspiration and net photosynthesis. These latter data are collected as source and sink strength terms for each 'layer' of the system permitting some separation of evaporation from transpiration.

Variation in evapotranspiration and the ratio of crop dry matter produced by photosynthesis per unit of water used, that is, water use efficiency, will be examined in relation to crop canopy geometry and meteorological factors.

University of Illinois

2.0438, SOIL-MOISTURE-PLANT GROWTH RELATIONSHIPS

D.B. PETERS, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Objective: To determine the effect of soil moisture content, soil moisture suction, hydraulic conductivity, and related soil physical properties on entry of water into plant roots.

Plan of Work: The separate and combined effects of soil moisture suction on moisture uptake by roots are evaluated under controlled environmental conditions. Seedlings are grown for short periods of time in soils with different moisture contents at a given suction level, and in soils with different suction levels at a constant moisture content. Changes in root weight and volume are used as indices of water transfer between soil and root. Radioactive tracers are used to simultaneously evaluate the relation between water uptake and ion uptake. Determination of the mechanisms of water movement through plants and ways that transpiration may be suppressed are underway. Mechanisms by which external factors influence transpiration are also under study. Determinations of the moisture retentivity and conductivity of soils for characterization purposes are included in this project.

SUPPORTED BY U.S. Dept. of Agriculture

2.0439, CLIMATIC INFLUENCE ON WATER USE AND CROP PERFORMANCE IN THE CORN BELT REGION

D.B. PETERS, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Object: To determine the plant-soil-meteorological interactions involved in the partition of energy at the earth's surface and to develop methods of beneficial alteration in energy dissipation in the Corn Belt region.

Plan of work: The soil-plant-atmosphere relationship and particularly crop geometry and the atmosphere will be evaluated. Possibilities for altering crop geometry to conserve moisture and create a more desirable soil-atmosphere environment for growing plants appear almost unlimited. Research will be directed toward an understanding of the evaporation process as it relates to the soil water-atmosphere system so as to increase the efficiency of utilization of available precipitation. This will involve a systematic evaluation of the effects of elements of climate such as net humidity, temperature and wind velocity on evaporation of water from soils and other surfaces. Studies will be made of the interrelations of net radiation, humidity, temperature and wind velocity on evaporation of water from soils and other surfaces. Studies will be made of the interrelations of net water from the soil and through plants, and energy transformed into dry matter by common crops. Fundamentals of moisture transfer and storage in the soil-atmosphere system will be investigated.

SUPPORTED BY U.S. Dept. of Agriculture

2.0440, SOIL MOISTURE FLOW PROBLEMS AND SOLUTIONS IN THE CORN BELT REGION

D.B. PETERS, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

Object: To develop (1) fundamental equations governing moisture transport, (2) means of solution of transport equations, and (3) method for evaluation of soil physical parameters essential to the solution of transport equations.

Plan of Work: The physical components of the environment are reduced to mathematical forms that can be utilized in transport equations. The solution of these equations through appropriate models, electrical resistance networks or electronic computers is developed and tested. Soil physical evaluative procedures are then developed to supply the data essential to the solution of the transport equations and the general utility of the solutions are translated into design features of water management systems. While the work in this investigation will be basic in nature, emphasis will be given to solution of flow problems in the Corn Belt region. (The design of a soil moisture management system is controlled by the soil-physical factors that govern the transport of water into and through soil.

2.0441, NUMERICAL ANALYSIS OF TIME-DEPENDENT FREE SURFACE FLOWS

W.D. ROSE, Univ. of Illinois, School of Engineering, Urbana, Illinois

Finite difference algorithms are being developed to model in three dimensional space the unsteady-states of motion in water that is in part or in whole bounded by so-called free surface boundaries. Field equations of both the Navier-Stokes and Fourier diffusivity types are under consideration, where in the former case special attention is also given the action of capillary forces, and where in both cases attention is given to the hydrodynamic and body forces of gravity. Applications range from considering the shape of falling rain drops, wave motion, action of water in hydraulic structures, open channel flow, soil infiltration problems, aquifer performance, and individual well problems.

SUPPORTED BY University of Illinois

2.0442, SYSTEMATIC ANALYSIS OF THE MOISTURE-TEMPERATURE INTERACTIONS ON CORN YIELD

E.C. RUNGE, Univ. of Illinois, School of Agriculture, Urbana, Illinois

The proposed research plan involves field, laboratory and statistical investigations to determine the interaction between plant available stored soil moisture (PASSM), at various rainfall and temperature combinations during the growing season on corn yield. The approach is to analyze historical corn yields where PASSM, rainfall and temperature are known or can be estimated. Various mathematical models relating PASSM, rainfall and temperature to corn yield will be studied with particular attention given to the interactions involved.

Field investigations will include measuring PASSM, rainfall, temperature and corn yield at several locations where the PASSM varies within a location and rainfall and temperature vary between locations. This data will be analyzed to determine the interactions between PASSM, rainfall and temperature on corn yield.

SUPPORTED BY University of Illinois

2.0443, STOCHASTIC TREATMENT OF RIVER GEOMETRY

A.E. SCHEIDEGGER, Univ. of Illinois, School of Engineering, Urbana, Illinois

Water is one of the important 'mines and minerals'. Because of this, the department has become involved in the study of river flow and drainage basin development. A test of meander formation showed that the latter can be regarded as a random walk process. An analysis of the structure of drainage basins showed that the configuration of the latter also can be regarded as the outcome of a stochastic process.

2.0444, HYDRAULIC GEOMETRY OF STREAMS

J.B. STALL, Univ. of Illinois, State Water Survey Division, *Urbana, Illinois*

A completed project shows there to be, for the 18 river basins in Illinois, a consistent pattern in which the width, depth, and velocity of flow in a stream change along the course of the stream, with a constant frequency of discharge. These channel characteristics are termed hydraulic geometry and constitute an interdependent system which can be described by a series of graphs having simple form, or by equations.

The data from about 250 stream gaging stations will be assembled and used to develop the parameters to define the hydraulic geometry of stream systems for ten river basins selected to represent various physiographic and hydrologic regions of the humid part of the United States. These parameters are to be generalized for various physiographic divisions and used to help explain variability of other observed hydrologic phenomena such as low flow frequency, and flow duration. These parameters will also be used to predict the average depth and velocity of flow at problem locations on the stream where no measurements are available. This will allow computation of the re-oxygenation capacity of the stream at a problem location, and the time-of-travel of contaminants through the stream system.

The study will extend enormously the range of hydraulic geometry parameters derived for very flat stream systems in Illinois.

2.0445, RAINOUT OF RADIOACTIVITY IN ILLINOIS

G.E. STOUT, Univ. of Illinois, State Water Survey Division, *Urbana, Illinois* (AT(11-1)1199)

Several studies are being pursued to acquire better understanding of the atmospheric processes controlling rainout and fallout, and, thereby, substantially improve our capability to predict the intensity of radioactivity under various meteorological conditions during periods of potential fallout hazard. A study of the relation between air motions and radioactive rainout in convective storms is being made to seek an explanation of the causes of various mesoscale rainout characteristics observed in past experiments. Another study is concerned with investigation of subsynoptic circulations in the upper and middle troposphere and their effect on the rate of diffusion of radioactive material. A laboratory investigation of sub-micron particle scavenging by rain is being initiated, since over 50 percent of tropospheric radioactive particulates are of this size.

2.0446, THE EFFECT OF VARYING SOIL MOISTURE REGIMES ON THE YIELD AND LEAF NITROGEN COMPOSITION OF CORN

E.H. TYNER, Univ. of Illinois, Agricultural Experiment Sta., *Urbana, Illinois*

Objectives: 1. To establish the effect of high plant populations on the critical N percentage of corn. 2. To determine the yield and leaf composition models relating population, N rate, and plant-available water levels when corn is planted on partially recharged soils and subsequently irrigated during the growing season. 3. On the basis of the results of the second objective, to develop N and population recommendations based on alternative decision models.

A 4 x 3 x 1 split plot field design field trial with 4 population rates varying from 16 to 18,000 plants per acre with 3N rates varying from no N to 150 lbs. and one water level will be carried out for objective 1.

A 2 x 2 x 3 x 3 split plot design field trial with 50 percent and 100 percent pre-season rooting volume moisture recharge, with 2 growing season moisture levels maintained by irrigation, with 3 population rates and 3 N rates will be carried out under objective 3.

Leaf composition and yields will be calculated out as quadratic functions of the water, population and N rates. These will be employed under objective 3.

2.0447, EFFECT OF RAINDROP IMPACT AND SURFACE ROUGHNESS ON SHEET FLOW

H.G. WENZEL, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

The general objective of this research is to examine in detail both experimentally and theoretically the mechanics of sheet flow. This knowledge will be useful in improving the design of urban drainage facilities where this type of flow is common. More specifically the individual objectives are: (a) to investigate experimentally the effect of raindrop impact on sheet flow using carefully controlled laboratory rainfall, surface profile, and runoff measurements, (b) to study in detail the pressure fluctuations caused by raindrop impact using pressure transducers and to correlate this work with the results of the first objective, (c) to study the effect of roughness on sheet flow on a more thorough basis than has been previously attempted and (d) to review the existing theoretical relationships describing sheet flow in the light of the experimental results so that, if necessary, modified equations can be developed which will reflect the true physical phenomenon.

2.0448, HYDRAULIC RESISTANCE IN ALLUVIAL CHANNELS

B.C. YEN, Univ. of Illinois, School of Engineering, *Urbana, Illinois*

The proposed research involves an analytical investigation directed at the determination of the hydraulic resistance for sediment-bearing flow in channels. The approach is to reanalyze the available experimental and field data based on dimensional analysis and mechanics of fluid and sediment movement.

The effects of the geometry of the channel, the properties of the sediment particles, and the characteristics of the flow are to be studied. The results will be presented in dimensionless general forms for engineering purposes such as river training, flood control, and canal design.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Illinois

2.0449, DROUGHT RESISTANCE IN BARLEY VARIETIES

J.J. CHINYOY, Gujarat University, *Ahmedabad, India*

Object: To investigate the resistance of barley to wilting at different growth and developmental stages and the role of sugars, phospholipids and protein in resistance; and to obtain a growth or developmental index for selecting varieties of barley for arid zones.

Plan of work: Indian and American varieties of barley will be treated with (1) normal watering during growth, (2) wilting at the tiller initiation stage, (3) wilting at the shooting stage, (4) wilting at the flowering stage, and (5) continuous moisture stress in the soil. Permanent wilting will be maintained for a fixed number of days, then normal watering resumed. Resistance of plants to drought will be estimated and varietal coefficients of plant parts determined. Coefficients of drought resistance for different plant parts will be determined, also different characteristics determining the yield of grain under the different treatments. Varieties of barley will be exposed to different photoperiodic cycles (24, 11 and 8-hour days). Drought intensity and related coefficients will be determined. Internal causes of drought resistance will be determined by water of dehydration and permeability of seedling; treatment of seeds with growth regulators and trace elements; and changes in carbohydrates, phospholipids and protein during growth.

2.0450, COMPARISON OF EVAPORATION INSTRUMENTS

M. GANGOPADHYAYA, Indian Dept. of Meteorology, New Delhi, India

The objectives of this research, which is funded under the Special Foreign Currency Program of the United States Government, are a. To construct and install various types of evaporimeter tanks, including the U. S. Class A Pan, the U.S.S.R. 20 sq. meter and GGI-3000 tanks, and a 16-foot diameter sunken plastic tank (U.S. backyard swimming pool). b. To obtain correlation coefficients between measurements of evaporation as obtained by the various instruments.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0451, NEW-TYPE GLYCOL MONO ALKYL ETHERS FOR THE CONTROL OF WATER EVAPORATION, TO EXTEND THE USE OF COTTONSEED OIL

A.B. BISWAS, Natl. Chemistry Lab. of India, Poona, India

Object: To determine the best method for introducing the ethenoxy group into alkyl alcohols, optimum number of such groups, and the physical properties of the product.

Plan of work: Alcohols will be prepared from saturated fatty acids of the cottonseed oil. A series of compounds of the type $\text{CH}_3(\text{CH}_2)_n(\text{CCH}_2\text{CH}_2)\text{OH}$ containing one thylene oxide group, will be prepared by such reactions as that of the bromides of the saturated fatty alcohols with monosodium glycolate, or by direct condensation of the fatty alcohols with one unit of ethylene oxide. The reaction products will be purified. Potential derivatives containing different functional groups also may be synthesized, and studies made of their relevant physico-chemical properties. The condensation of the alcohols with multiple units of ethylene oxide to give products of the type $\text{CH}_3(\text{CH}_2)_n(\text{CCH}_2\text{CH}_2)_x\text{OH}$ will be studied also, to spreadability on water surfaces, stability against chemical degradation, wind, wave, and dump action, ambient temperature, and the ease of repair of the damaged surface. The products will be tested for emulsifying ability and attention given to possible flavor or toxicity effects in waters protected by these materials. The surface phenomena of the products will be studied. These compounds will be tested for evaporation properties, particularly for resistance to 'piling up' due to wind activity and for efficiency and rapidity of self repair to ruptures of film surfaces.

SUPPORTED BY U.S. Dept. of Agriculture

2.0452, THERMAL AND BIOLOGICAL CHARACTERISTICS OF LAKES

R.G. LIPSCOMB, U.S. Dept. of Interior, Water Resources Division, Fort Wayne, Indiana

The project is to evaluate methods of evaporation computation, study thermal-stratification processes, investigate biological influences on water quality, and study the process of lake aging. Where practical, new investigative techniques will be developed. Time and spacial distribution data from detailed counts of algal species in Pretty Lake, LaGrange County, Indiana, are being related to the distribution of water temperature and of chemicals known to be important in growth processes. Wind, temperature, and radiation data are being used in the study of water temperatures and evaporation. Analyses of plant and animal remains in the lake sediments, along with other sediment analyses, will provide data for the study of the aging process in Pretty Lake.

2.0453, CHANNEL MEANDER STUDIES

J.F. DANIEL, U.S. Dept. of Interior, Water Resources Division, Indianapolis, Indiana

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Indiana.

Purpose: To develop predictive criteria for movements of river channels.

Methods: Several channel meanders in different types of soil in different areas of the State have been selected for study. Variables such as peak discharges, average discharge, grain size of bed and bank materials, and suspended sediment loads will be correlated with measured changes in meanders to establish relations which may exist. If relations can be established, meander movements may be predicted at other locations.

2.0454, EVAPORATION LOSSES FROM LAKES IN INDIANA

C.H. TATE, U.S. Dept. of Interior, Water Resources Division, Indianapolis, Indiana

Purpose: To determine the evaporation losses from a lake in central Indiana by the energy-budget method and to develop a coefficient to be used with the mass-transfer method of computing evaporation elsewhere in the state.

Methods: Initially the energy-budget method will be used to determine evaporation from Morse Reservoir in central Indiana and a coefficient computed to be used with the mass-transfer method. Within 2 years enough data will have been collected to determine this coefficient for Morse Reservoir and the station will be discontinued as an energy-budget station but will be continued as a mass-transfer evaporation station. New sites for energy-budget studies will be selected through the state to define a curve of surface-area vs. mass-transfer coefficient so that the mass-transfer method of evaporation computation may be used anywhere in the state.

2.0455, LOW FLOW CHARACTERISTICS OF INDIANA STREAMS

C.H. TATE, U.S. Dept. of Interior, Water Resources Division, Indianapolis, Indiana

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Indiana.

Purpose: To analyze stream flow data and determine low flow characteristics such as flow frequencies and duration.

Methods: Stream flow at continuous record gaging stations will be arrayed by computer at periodic intervals. A network of low-flow stations where base discharges will be measured periodically will be operated. Frequencies and durations will be determined at gaged sites and estimates of certain parameters will be made for ungaged sites through correlation techniques.

2.0457, MECHANICS OF SOIL EROSION BY WATER

M.F. BAUMGARDNER, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

2. WATER CYCLE

(1) To determine the erodibility of soil as influenced by its particle characteristics; (2) to determine the effect of rainfall splash and overland runoff on soil erosion; (3) to determine the importance of rainfall characteristics on the erosion process; (4) to determine the effect of temperature on soil detachability and transport; (5) to investigate and evaluate the properties of soils which produce resistance to detachability and transport.

To better understand the mechanics by which water causes soil erosion, the phenomenon is to be studied under somewhat idealized but controlled, laboratory conditions. Simulated rainfall and soils will be initially utilized in experiments with shallow water flow over soil beds and through flumes. Concurrent experiments of the resistive mechanisms of natural soils will also be begun to give practical significance to findings with simulated soils.

2.0458, THE EFFECT OF URBANIZATION ON RUNOFF IN SMALL WATERSHEDS

J.W. DELLEUR, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

The objective of the research is to study the effect of varying degrees of urbanization on the rainfall - runoff relationship in pre-urban, early suburban and suburban watersheds principally in West Lafayette, Indiana. For this purpose the following watersheds will be used: a) the Ross Ade drain upper and lower watersheds having areas of 29 and 333 acres respectively, covering a fully developed suburban development and a portion of the Purdue campus respectively. b) The Purdue Swine Farm covers two watersheds having a total area of about 470 acres, the upper watershed is in the process of being developed, the lower watershed is a pre-urban stage. It is expected to evaluate the volume and peak rate of runoff, the shape of the hydrograph, the frequency of peak discharge, the infiltration rate, the base flow, the time of concentration and the time lag in terms of the land use intensity. The data obtained will be analyzed by means of conceptual and/or mathematical models simulating watersheds with varying degrees of urbanization.

2.0459, ASSEMBLY AND ANALYSIS OF HYDROLOGIC AND GEOMORPHOLOGIC DATA FOR SMALL WATERSHEDS IN INDIANA

J.W. DELLEUR, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

A computer oriented assembly and retrieval system will be developed for hydrologic and geomorphologic data for watersheds from 2 to 300 square miles in Indiana. This will include approximately 55 watersheds for which a large number of single peak hydrographs will be digitized at 15 or 30 minute intervals. A number of hydrograph and storm characteristics will be evaluated. The geomorphologic characteristics will be obtained from drainage and topograph maps. The data will be loaded on magnetic tape.

Upon completion of the data assembly, the hydrologic response of small Indiana watersheds will be evaluated under varying rainfall and climatic conditions. Attempts will be made to correlate the parameters describing the hydrologic system transfer functions to the basin hydrologic and geomorphologic characteristics. The final objective is the development of prediction methods for streamflow forecast for ungaged basins in Indiana.

2.0460, EXPERIMENTAL INVESTIGATION OF THE DEPENDENCE BETWEEN TURBULENCE EDDY VISCOSITY AND FLUID VISCOSITY

V.W. GOLDSCHMIDT, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

Momentum and mass are diffused by molecular effects through viscosity as well as by turbulence agitation of fluid elements. The diffusive effect of turbulence has been explained by defining an 'Apparent Eddy Viscosity' a convenient grouping of variables whose value up to now has only been deduced from measurements. Inasmuch as most reliable measurements of turbulent properties have been made in air (where the viscosity is especially constant) it has not been possible to conclude (except through similarity postulates) whether or not that this 'apparent' turbulent 'viscosity' is dependent on the fluid properties themselves.

Under the current research, the measurements of turbulence intensities and velocity distributions in a submerged liquid jet will be made and the dependence or lack of dependence between eddy and molecular viscosity will be investigated.

SUPPORTED BY Purdue University

2.0461, MATHEMATICAL SIMULATION OF HYDROLOGIC EVENTS ON UNGAGED WATERSHEDS

L.F. HUGGINS, Purdue University, Water Resources Research Ctr., Lafayette - West Lafayette, Indiana 47907

The basic approach of the proposed research project is to develop relationships describing the dynamics of the various components of the runoff process for small elemental areas within a watershed. Fundamental hydrodynamic equations will then be utilized in high speed computers to integrate the spatially varied, time dependent outputs from all of the many elements within the watershed to obtain a composite runoff hydrograph.

Then after a composite runoff hydrograph has been developed, the adequacy of the mathematical model will be tested by applying the model to several small gaged watersheds from which records are currently available and comparing the predicted and observed hydrographs. The sensitivity of the predicted hydrographs to variations in parameter values for the various hydrologic components will then be investigated. On the basis of this investigation, it is anticipated that a laboratory model will be constructed for investigating shallow flow over erodible surfaces where detention and retention are apt to be pronounced. Upon refining one or more of the sensitive parameters in the model, the model will then be applied to larger, more complex gaged watersheds for a comparison between the predicted and actual runoff.

2.0462, MATHEMATICAL SIMULATION OF HYDROLOGIC EVENTS ON UNGAGED WATERSHEDS

L.F. HUGGINS, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

(1) To develop the fundamental mathematical relations describing the mechanics of surface runoff within a watershed and the digital computer programs required to perform the integration of the resulting equations to produce a complete runoff hydrograph; (2) To investigate the adequacy of the mathematical model by applying it to several gaged watersheds from which records are currently available and comparing predicted and observed runoff hydrographs; (3) To use the above mathematical model and currently available data to investigate the sensitivity of predicted hydrographs to variations in parameter values for the various hydrologic components of the model; (4) On the basis of the results of Objective 3, to initiate laboratory studies of the more important hydrologic components not currently being investigated elsewhere in suitable detail in order to obtain more precise quantifying information than is currently available.

The basic approach for this project is to develop relationships describing the dynamics of the various components of the runoff process for small elemental areas within a watershed. Fundamental hydrodynamic equations will then be utilized in high speed computers to integrate the spatially varied, time dependent outputs from all of the elements within the watershed to obtain a composite runoff hydrograph.

2.0463, RELATIONSHIP BETWEEN THE ERODIBILITY OF SOILS AND THE SEDIMENTATION RATE OF RESERVOIRS

H. KOHNKE, Purdue University, School of Agriculture, Lafayette - West Lafayette, Indiana 47907

Many studies exist that reveal the effects of climate, topography, vegetation, land use, and the relation of watershed size and reservoir size upon the rate of sedimentation of reservoirs. Surprisingly no specific studies exist that relate the properties of the soils of the contributing watershed to the sedimentation rates. It must be assumed these are related to the erodibility of the soils. However, the same amount of eroded soil material from two watersheds will contribute different amounts of sediment to a reservoir, depending on the mechanical composition. Much of the sand is frequently deposited in the flood plains above the reservoir while a big portion of the clay passes through the reservoir unless the electrolyte content of the water is quite high.

This project will determine the soil properties that can be expected to contribute to sedimentability in watersheds that drain into reservoirs for which the sedimentation rates are known. Considering also the other factors affecting sedimentation rates, an attempt will be made to correlate measurable soil properties to the sedimentability of the soils studied.

2.0464, DEVELOPMENT OF LAND USE EQUATIONS FOR THE SLOPING SOILS OF INDIANA

J.V. MANNERING, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

(1) To derive land use equations applicable to Indiana conditions; (2) To evaluate some of the newer practices such as mulch tillage, deep tillage, and minimum tillage.

DESCRIPTION OF WORK: A portable rainfall simulator that produces artificial storms of approximately the kinetic energy of high intensity natural rainfall will be used to test factors that affect soil erosion. Factors to be tested include soil erodibility, length of slope, percent of slope, past erosion, crop cover at various stages of growth, crop rotations, tillage practices, and residue management. Through the use of this equipment to evaluate these factors that affect runoff and erosion, it is hoped to complement existing natural rainfall data in arriving at realistic values for land use equations.

2.0465, AN INTEGRATED SYSTEM OF STREAM CLASSIFICATION

W.N. MELHORN, Purdue University, Water Resources Research Ctr., Lafayette - West Lafayette, Indiana 47907

A stream classification system which will quantitatively make comparisons of one stream to another has never been developed. It is the objective of this research to establish a system by finding some patterns of similarity between all streams. Geologic factors such as types of soil and rock, rock structure, and age; hydrologic factors as depth, load, and channel roughness; and geomorphic factors as topography and stream number will be considered as possible parameters in establishing such a classification system. The data will be taken from a wide range of streams, including all the major rivers of the world. Patterns of similarities will be revealed by parameter correlation, using the computer to determine the interrelationships of these parameters. Establishment of a unified, systematic terminology of stream classification will greatly improve the communication framework within which all water research is conducted, regardless of field of specialization.

2.0466, ELECTRICAL EFFECTS ON WATER INFILTRATION INTO SOILS

D. SCHWARTZENDRUB, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

(1) To determine experimentally the magnitude of the streaming potential developed under conditions of steady and transient-state (infiltration) water flow in unsaturated soils; (2) To predict streaming potential theoretically by beginning with present unsaturated flow theory and making suitable modifications for the effect of unsaturation; (3) To compare theoretical predictions of streaming potential with the experimental determinations.

The experimental work will emphasize the simultaneous measurement of electrical streaming potential (using pH meter and strip-chart recorder), water content (using gamma-ray attenuation), and soil-water suction (using a transducer-recorder technique). These will be measured as functions of time and position in a uniformly packed column of horizontal soil to which water is added at one end. Use of the experimental findings to validate theoretical predictions should enable the development of more realistic and precise equations for describing water infiltration into soil.

SUPPORTED BY Indiana State Government

2.0467, ELECTRICAL EFFECTS ON WATER INFILTRATION INTO SOILS

D. SWARTZENDRUBER, Purdue University, School of Agriculture, Lafayette - West Lafayette, Indiana 47907

The hydraulic movement of water through porous membranes and porous materials saturated with water or water solution can produce an electrical streaming potential which opposes the hydraulically induced flow. This phenomenon should also be present in unsaturated water flow processes, such as the infiltration of water into soil. The objectives of the proposed research are: 1. To determine experimentally the magnitude of the streaming potential developed under conditions of steady and transient-state (infiltration) water flow in unsaturated soils. 2. To predict streaming potential theoretically, by beginning with present saturated flow theory for membranes and making suitable modifications for the effect of unsaturation. 3. To compare theoretical predictions of streaming potential with the experimental determinations.

Studies realizing these objectives should provide a better understanding of the infiltration process, and should enable the development of more realistic and precise equations for describing the infiltration of water into soil. They may also point the way toward possible use of electrical energy to assist the entry of water into soil, either by neutralizing the streaming potential or in an electroosmotic sense.

Experimental work will emphasize the simultaneous measurement of electrical streaming potential (potentiometric strip-chart recorder), water content (gamma-ray attenuation), and soil-water suction (transducer-recorder technique). These will be measured as functions of time and position in a uniformly packed column of horizontal soil to which water is added at one end.

2.0469, DYNAMICS OF WATER INFILTRATION INTO SOIL AS GOVERNED BY SURFACE CRUSTING AND SEALING

D. SWARTZENDRUBER, Purdue University, School of Agriculture, Lafayette - West Lafayette, Indiana 47907

The infiltration of water into soil can be strongly affected by the presence of crusts or seals at the soil surface. It is proposed to study the dynamics of water flow through crusts and seals, to provide a basis for characterizing them with respect to their water transmitting properties under flow conditions associated with infiltration. The specific objectives of the study are: 1. To obtain mathematical solutions for the entry of water into unsaturated soil when a thin layer of low intrinsic permeability is located at the inlet surface of the soil. 2. To test the experimental validity of the mathematical solutions on idealized crusted-sealed unsaturated flow columns. 3. To obtain experimental measurements of water infiltration into unsaturated soil columns containing an actual crust-seal produced by either natural or artificial rainfall.

The results of Objective 3 will be compared both with the mathematical solution of Objective 1 and the results of the idealized crusted-sealed system of Objective 2. On basis of these comparisons, quantitative characterization of the flow properties of the crust-seal will be sought. Experimental observations to be taken will include water content by gamma-ray attenuation at various times and positions in the soil columns, total volume of water absorbed by the columns, and possibly soil-water suction by means of transducer tensiometers.

2.0470, FLOW LAWS FOR THE MOVEMENT OF WATER IN SOILS

D. SWARTZENDRUBER, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

(1) To evaluate the nature and extent of deviations from Darcy's law in water saturated porous media; (2) To evaluate the nature and extent of deviations from Darcy's law in porous media partially saturated with water; (3) To study the flow behavior of non-Newtonian liquids in porous media.

Various mixtures of sand, silt, and clay will be placed in permeameter cylinders and subjected to a range of different hydraulic gradients. The flow velocity through the samples will be plotted against the hydraulic gradient to determine the constants in a newly proposed basic flow law. An attempt will be made to correlate these constants with nature of the sand-silt-clay mixture. This will assist in determining limits of validity for Darcy's law, which is a special case of the newly proposed basic flow law. In systems where Darcy's law is expected to be valid, such as for sands, some non-Newtonian liquids will be passed through. This should give some indication as to whether deviations from Darcy's law when water is the liquid can be accounted for on a non-Newtonian basis.

2.0472, FLUID ELASTIC OPERATORS FOR UNDER-STREAMLINED STRUCTURES

G.H. TOEBES, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

This research has been concerned with the Hydroelastic loading of circular and triangular cylinders. The experimental investigation has been concerned with the deformation dependent 'Fluid Elastic Operator' for a circular cylinder, a triangular cylinder with the apex towards the flow, and a triangular cylinder with a blunt face towards the flow, all placed normal to the fluid flow. The cylinder was subjected to a simple harmonic motion with the lift force and displacement being measured. The amplitude and frequency of the cylinder motions were varied. The study resulted in the determination of the energy transfer between the cylinder and the fluid flow and the amplification of the lift force with frequency of oscillation close to the Strouhal frequency.

2.0474, ESTIMATING SOIL MOISTURE FROM METEOROLOGICAL MEASUREMENTS

D. WIERSMA, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

Objectives: (1) Determine the potential evapotranspiration rate under Indiana conditions. (2) Determine the effect of decreasing soil moisture on the evapotranspiration rate. (3) Develop a method for estimating soil moisture under different vegetative covers, soil types, and various geographic areas of Indiana. (4) Develop a method for estimating the daily, weekly, and seasonal soil moisture conditions for the several geographic areas of Indiana.

From routine meteorological measurements, it is proposed that an estimate of the soil moisture condition at a particular time and at a given location in Indiana be made. The relationship between the atmospheric energy gradient to the potential evapotranspiration rate and in turn this evapotranspiration rate to soil moisture changes makes this possible. The interaction of decreasing soil moisture unsaturated hydraulic conductivity and the atmospheric energy gradient on evapotranspiration will be studied in the laboratory. The effect of kind and amount of vegetative cover and soil types will be studied in the field.

W.H. WISCHMEIER, Purdue University, U.S.D.A Soil & Wat Cons. Lab., Lafayette - West Lafayette, Indiana 47907

Object: To evaluate under field conditions the primary and interaction effects of soil characteristics, rainfall, land slope, vegetative covers, and management practices upon runoff, water erosion and wind erosion.

Plan of Work: Measurements of the effectiveness of cropping systems and management plans and studies of the relationships of runoff and soil loss to length and degree of slope and to physical and chemical properties of the soil will be made under both natural and artificial rainfall. The studies will be designed to provide reliable information on the interaction effects as well as on the primary effects of the different variables which influence field runoff and soil loss. The runoff and erosion control effectiveness of new practices such as interseeding of row crops, plow-plant and mulch tillage will be evaluated under various soil and slope conditions using field plot rainfall simulators. Effects of soil characteristics will also be measured under small laboratory and field plot rainfall applicators. Runoff and soil loss data obtained under natural rainfall will be used as benchmark information to aid in analysis of qualitative data obtained with the simulators.

2.0477, DEVELOPMENT AND REFINEMENT OF METHODS FOR PREDICTING FIELD RUNOFF AND SOIL LOSS

W.H. WISCHMEIER, Purdue University, U.S.D.A Soil & Wat Cons. Lab., Lafayette - West Lafayette, Indiana 47907

Object: To develop tables, equations and graphs for prediction of field runoff and soil losses and to refine the soil loss prediction equation methods for applying conservation practices to farm fields and estimating sediment production rates.

Plan of work: All rainfall, runoff, soil loss and related data secured from small runoff plots of the Division are assembled at Lafayette, Indiana, for graphical analysis and transfer to punch cards for machine correlation and other analysis. Relationships established are immediately available for improving the accuracy of the soil loss prediction method. Selected research workers in major areas of the humid region will have the results of the analysis for study and adaptation to their local conditions. They will work directly with State and regional SCS personnel in the development and refinement of the method for use by SCS farm planners. U. S. Weather Bureau records on rainstorm duration and intensity will be used to supplement location records and extend the area of soil loss application. Periodic review and planning conferences insure achievement of study objectives and use of improved techniques of data handling and presentation of results.

2.0478, GROUND WATER SEEPAGE PATTERNS TO WELLS FOR UNCONFINED FLOW

D. KIRKHAM, Iowa State University, School of Agriculture, Ames, Iowa 50010

To derive exact theories for seepage of water to wells and cavities in semi-confined aquifers, to digitally computerize these

theories, and from the computed values of the potential and stream functions to prepare flow nets, showing, in particular, the location of free surfaces. These exact theories would replace approximate theories obtained by Dupuit-Forchheimer procedures or other approximate methods. The theories will show how accurate electric and other type analogs may be relied on. The theories are needed to understand well dynamics accurately and to furnish coefficients needed to convert accurately measured rates of water rise in piezometer cavities to hydraulic conductivities. The exact theory for the buffered infiltrometer will be worked out. The problems considered here are three-dimensional and therefore not subject to (two-dimensional) conformed transformation procedures.

2.049, SIMULTANEOUS FLOW OF WATER AND HEAT IN WATER-UNSATURATED IOWA SOILS DURING EVAPORATION

D. KIRKHAM, Iowa State University, School of Agriculture, Ames, Iowa 50010

Simultaneous flow of water and heat into one- and two-dimensional homogeneous, and layered soils with and without cracks, will be studied under controlled laboratory conditions. The soils will be packed in plastic containers and saturated with water. Soil temperature will be measured with thermocouples installed at various positions throughout the soil. The soil container will be placed below a bank of heat lamps in a wind tunnel where air velocities will be controlled. Changes in soil moisture content during evaporation will be followed by measuring the soil moisture at a series of times at various positions throughout the soil using the gamma ray-attenuation technique. The gamma ray attenuation technique will be used to measure the bulk density of the soil at various positions in the model. An attempt will be made to solve the differential equations describing the flow of heat and moisture in unsaturated soils either analytically or numerically, and the theoretical results will be compared with the experimental data.

Iowa State University

2.0480, MOVEMENT OF WATER AND GASES IN SOIL

D. KIRKHAM, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

Develop and test mathematical theory and formulae for relating soil water and gas movement to physical properties. Improve the neutron scattering device and attempt to combine with density measurement by gamma ray absorption. Develop theory for using tagged atoms to follow water movement in soil and plants.

DESCRIPTION OF WORK: The theory of ground water movement will be further developed for the saturated and unsaturated state. Emphasis for the saturated state will be on the mathematical solutions of drainage problems, and especially on the problem of the falling water table. Emphasis on the unsaturated state will be on evaporation. The isotopes deuterium and oxygen-18 will be used as tracers for studying problems of water and gas movement through soils and plants. Neutron and gamma ray equipment will be used for soil water and soil density measurements.

2.0481, INTERRELATIONSHIP OF SURFACE AND SUB-SURFACE FLOW IN THE NISHNABOTNA DRAINAGE BASIN

L.V. SENDLEIN, Iowa State University, Graduate School, Ames, Iowa 50010

The Nishnabotna River basin drains a modified glacial terrain with Pleistocene deposits overlying bedrock. The Pleistocene deposits are composed of glacial drift with sand and gravel-filled channels associated with the buried bedrock valleys. The bedrock

2. WATER CYCLE

aquifers subcrop within the basin and where they intersect the modern alluvial or buried sand and gravel systems, they discharge into them. Discharge hydrography can be used to evaluate groundwater discharge at the point of measurement, however the source of the water and the amount moving into or out of the basin cannot be determined by this method. In order to determine the amount discharged to streams, the relationship of the subsurface geology to the modern alluvial system must be known.

This study is composed of two phases: 1. evaluation of subsurface flow into and out of the Nishnabotna Basin, and 2. location and evaluation of discharge from the subsurface to the modern stream system.

2.0482, EFFECTS OF WEATHER ON CROPS

R.H. SHAW, Iowa State University, School of Agriculture, Ames, Iowa 50010

A continuing study to examine meteorological techniques for estimating evapotranspiration and soil moisture and to test techniques for calculating evapotranspiration losses and improve usefulness in determining the available moisture in meadow crops. Test periods are April-June, June-August, and August-November. Estimated soil moisture is compared with measured soil moisture.

Evaluation of the effect of advected energy on the metal evaporation pan directly will be initiated in FY-68.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0483, USE OF INFRARED AND OTHER RADIATION TECHNIQUES TO EVALUATE DROUGHT IN IOWA AND ADJACENT AREAS

R.H. SHAW, Iowa State University, School of Agriculture, Ames, Iowa 50010

A method is proposed to detect the onset and development of drought by the measurement and analysis of the spectral radiation characteristics of plants. Because the various factors producing water stress in plants reduce the quality and quantity of the harvested plants, it is important to detect drought intensity differences under a variety of different management practices.

Radiation theory indicates that the spectral 'signature' of plants could differ because of chemical composition, color, temperature, water content, etc. Experimental evidence has established that a reduction in near infrared reflectance occurs as a result of drought but could not be distinguished from nutritional and disease disorders by infrared photography alone. A spectrophotometric analysis is proposed in the 0.4 to 1 micron wavelength region to investigate the possible separation of the causative factors. Infrared photography will also be used. The results will be correlated with the stress conditions of plants as evaluated by presently available techniques.

2.0484, WEATHER INFORMATION FOR AGRICULTURE

R.H. SHAW, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

Objectives: 1. Iowa weather data will be analyzed and interpreted for problems in agriculture. 2. Iowa weather data analysis will be coordinated with similar information in the North Central Region. 3. Both state (The Climate of Iowa) and regional publications will be published as summaries are completed.

Work proposed - The work proposed involves the analysis of soil moisture - atmospheric stress conditions (stress day concept) for several experimental farms in Iowa. An analysis will be made of the climatology of stress days. The study of weather and oat yields over the region will be continued. Data will be furnished for any regional summaries undertaken by the regional committee.

2.0485, SOIL AND CLIMATE FACTORS AFFECTING THE EFFICIENT USE OF WATER BY CROPS

R.H. SHAW, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

Using soil moisture data collected over Iowa, a method has been developed by which daily soil moisture balances can be predicted. Precipitation and evaporation pan data are the weather data used. Procedures have been developed for corn, meadow and oats.

The climatology of soil moisture under corn at Ames, Iowa was estimated for 30 years, 1933-62 for the different available field capacities and for each 3 different 'starting' soil moisture profiles in the spring. An atmospheric - soil moisture variable was developed and used in the interpretation of the effects of weather, stand and fertilizer treatment on long term experimental plot corn yields. The climatology of water stress conditions for corn was also prepared. The methods are now being expanded to other climatic regimes.

The efficiency of water use with different row spacings of corn has been studied and the relative amounts of water lost by soil evaporation and transpiration evaluated.

SUPPORTED BY Iowa State Government

2.0486, FLOW OF WATER INTO TILE DRAINS ON STRATIFIED SOILS

S. TOKSOZ, Iowa State University, School of Agriculture, Ames, Iowa 50010

A solution for the Laplace's equation will be sought in connection with water flow into tile drains in a stratified soil having different permeabilities and with a curved water table between the drains. It is expected that the resulting solution, containing the drain spacing implicitly, can be transformed into an explicit form to give the drain spacing directly. The drain spacing formula will then be put into a graphical form so that it can be easily used by the designers. The effects of various soil and drainage parameters on drain spacing will be explored from the standpoint of setting up useful design criteria.

2.0487, INJURY AND RESISTANCE IN PLANTS

D.G. WOLLEY, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

The overall objective is to determine how and to what degree the water status of plants is related to growth and development and is influenced by physical factors of the environment.

A number of measurements relating to plant moisture stress will be made. These include relative turgidity, stomatal opening, beta-ray gauging and leaf temperature. The accuracy of each and the relationship between them will be examined. Work will be conducted primarily on soybeans and corn. Plant observations to be related to moisture stress measurements are leaf area and efficiency, growth rate, grain yield and seed quality. The effect of timing of moisture stress will be determined by applying moisture stress at different stages of plant development. The photosynthetic response of varieties will be studied in controlled growth chambers under various moisture stress regimes. Growth chambers will also be used in evaluating the effect of moisture stress on nutrient uptake and translocation. Measurements of plant moisture stress will be related to environmental factors more easily measured (solar radiation, evaporation, soil moisture, etc.) in an attempt to obtain some degree of predictability.

2.0488, WATER AVAILABILITY OF MUSCATINE ISLAND, IOWA

R.E. HANSEN, U.S. Dept. of Interior, Water Resources Division, Iowa City, Iowa

2. WATER CYCLE

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Iowa.

Purpose: To provide guidelines for optimum development and management of the water resources of the area by defining the hydrologic system and analyzing the system's response to present and anticipated development.

Methods: Test holes will be drilled to define the extent, thickness, and physical characteristics of the aquifer. Observation wells will be installed and periodic measurements will be made to determine the water table and the vertical flow component. Aquifer inventory of withdrawals from the aquifer will be made. Water samples from observation wells and existing wells will be collected and analyzed to determine areal distribution and time variation of chemical constituents. An analog model will be constructed and analyzed to predict and define the hydrologic system's response to additional development.

2.0489, LOW-FLOW STUDIES OF IOWA STREAMS

H.H. SCHWOB, U.S. Dept. of Interior, Water Resources Division, Iowa City, Iowa

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Iowa.

Purpose: To evaluate the firm water-supply potential of streams which will assist in the administration of the Iowa water law and in the development, administration and enforcement of water quality criteria applicable to surface waters.

Methods: Approximately 435 low-flow partial-record stations were established where at least one low-flow discharge measurement is made each year. By correlation with complete-record stations, data from the low-flow partial-record stations can be used to estimate low-flow yields in practically every area of the State. A report prepared in 1958, 'Low-flow Characteristics of Iowa Streams,' is currently being updated. The updated report will include duration-of-flow data, low-flow frequency analyses, and methods for predicting the mean flow and possibly on other index of low flow at ungaged sites.

2.0493, DETERMINATION OF EVAPOTRANSPIRATION FOR SHORT INTERVALS ON A BENCHMARK BASIN

D. ROSENZWEIG, Ruppert Inst. of Agriculture, Emek Hefer, Israel

The description of this research project which is funded under the Special Currency Program of the United States is as follows: The benchmark basin is located in the Karst area of the Nahal Oren catchment on Mount Carmel. The purpose of the study is to (a) develop relationships between soil moisture changes (actual evapotranspiration) and various meteorological factors, (b) compare long period evapotranspiration obtained by neutron scattering meter to those obtained by energy budget, (c) study hydrologic balance for the basin.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0494, MOVEMENT OF IONS AND SALTS IN SOILS

R.S. MOKADY, Technion Res. & Develop. Fdn., Haifa, Israel

Object: To study the movement of ions in saturated and unsaturated soils and clays and the effect of soil stratification on this movement.

Plan of work: Theoretical development: Present theories for chromatography, miscible displacement, ion diffusion, and hydrodynamic dispersion will be examined, modified, and consolidated into a unified model applying to the practical problem of salt movement and fertilizer distribution in soils. Simplifying assumptions, when necessary, will be those most compatible with the conditions of the laboratory trials. Laboratory trials: The rate of salt and ion movement during water flow through clays and through real and simulated layers of soil will be measured, as well as the salt distribution pattern through one dimensional and three-dimensional flow. The movement will be monitored both conductimetrically and through the use of radioactive tracers. Radioactive sodium, chlorine, and tritium will be used as much as possible in tracing the relative movement of salt and water through the layers. Variables involved will include soil moisture content, soil profile homogeneity, salt composition and concentration, and temperature. After the preliminary stage, in which many of these variables will be studied independently, the variables will be combined and the interactions examined.

SUPPORTED BY U.S. Dept. of Agriculture

2.0495, DEVELOPMENT OF METHODS FOR MEASURING PARTIAL VAPOR PRESSURE OF SOIL WATER

D. ZASLAVSKY, Technion Res. & Develop. Fdn., Haifa, Israel

Object: To develop (1) a convenient method for measuring the partial vapor pressure of soil water, (2) a method which does not require strict laboratory conditions, and (3) a method usable in the 98 to 100% relative humidity range.

Plan of Work: This project concerns itself with development of instrumentation for measuring the partial vapor pressure of plant and soil water. The first stage of this research would be the development of some improved methods for measuring the partial vapor pressure of soil and plant water. The second stage of the

2. WATER CYCLE

research would be to use the method in some preliminary investigations of water movement in soil. Methods of instrumentation to be investigated and their order of investigation are: (1) measurement of dielectric constant, (2) osmotic pressure, (3) refractive index, and (4) radioactive krypton.

2.0496, PRECIPITATION, STREAMFLOW AND SEDIMENT CONVEYANCE IN A SMALL ARID WATERSHED

D. AMIRAN, Hebrew University, Jerusalem, Israel

This research project which is funded under the Special Currency Program of the United States will investigate precipitation to determine maximum intensities, areal variability, and effects of relief, exposure and wind. Peak flows will be obtained at numerous locations and continuous flow at the mouth. Flash floods will be sampled for sediment concentration, erosion on slopes and in channels, and sediment tracing by isotope or fluorescent dyes. It is hoped that desert flash floods with recurrence interval of 5-10 years will provide conclusions relevant to more infrequent events in humid environments.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0497, THEORETICAL AND EXPERIMENTAL INVESTIGATIONS OF THE MECHANISM OF FLOW OF WATER AND SOLUTES IN PLANT ROOTS

B. BINZBURG, Hebrew University, Jerusalem, Israel

Object: 1. To analyze the steady-state flows of water and solutes across roots; (2) To explain the mechanism and site of separation of solute from the water which occurs in the plant root tissue; (3) To explain the salt tolerance of plants on the basis of both water flow and chemical reaction.

Plan of Work: Theoretical attempts will be made to adapt the thermodynamics of irreversible processes to a study of ultrafiltration. The theory should deal with flows through homogenous membranes as well as those through complex membranes. It should resolve the dependence of ultrafiltration on the composition of solutions and on driving forces as gradients of hydrostatic pressure, osmotic pressure and electrical potential.

SUPPORTED BY U.S. Dept. of Agriculture

2.0498, SOIL WATER EVAPORATION AND MEANS OF MINIMIZING IT

D. HILLEL, Volcani Inst. of Agric Res., Rehovot, Israel

Object: To test recent developments in the theory of unsaturated soil-moisture flow; to determine the extent to which evaporation losses can be minimized by modification of surface conditions; and to develop methods for moisture conservation in bare surface soils.

Plan of work: A rigorous examination and development of theory for various boundary conditions and planning of laboratory and field trials will be conducted. In this stage, it may be necessary to submit problems to solution by electronic computers. All pertinent soil-water and soil-thermal properties will be determined, including diffusivity, conductivity and retention properties. The experiments will include steady-state and transient-state processes, finite and semi-infinite columns; uniform and layered profiles; steady and intermittent evaporation; as well as isothermal and non-isothermal columns. Each variable will be tested separately and later combined and the interactions examined with a view toward finding a feasible combination of profile properties and environmental conditions likely to result in diminution of evaporative losses. The theoretical and experimental results will be tested in the field, to determine their applicability under varying conditions of soil and natural climate. These experiments will include pre-wetting and post-wetting tillage, structural stabilization by chemical means, and the use of materials.

SUPPORTED BY U.S. Dept. of Agriculture

2.0499, SOIL STRUCTURE - TILLAGE INTERACTIONS

D. HILLEL, Volcani Inst. of Agric Res., Rehovot, Israel

Object: To investigate the influences of tillage operations on soil physical conditions related to crop growth.

Plan of Work: Theoretical development: A rigorous examination will be made of the dynamics of soil-water systems, and the application of the theories of elastic, plastic and rheological models to compaction and tillage of unsaturated soils.

Laboratory trials: Measurements will be made of stress - deformation - failure properties of soils for boundary conditions simulating tillage, and tests made of similitude models of simple tillage tools. Field trials: Theoretical and laboratory results will be applied in the field, and field techniques developed for evaluating tillage efficiency. These experiments will measure and analyze soil and tool stresses, power requirements and tractability. In addition to the mechanical factors, soil physical processes will be followed, as well as crop response under various tillage systems. The study thus envisages the cooperative effort of soil physicists, engineers, and agronomists.

SUPPORTED BY U.S. Dept. of Agriculture

2.0500, THE PHYSIOLOGICAL BASIS OF THE TOLERANCE OF HORTICULTURAL CROPS TO COLD, DROUGHT, AND WATER

B. KESSLER, Volcani Inst. of Agric Res., Rehovot, Israel

Object: To determine the basic plant structures which are susceptible and become injured through the effect of cold, drought, and high water stress and to then develop chemicals which may aid the plants in meeting these stress conditions.

Plan of Work: Experiments will be conducted under induced cold and water stress. Initially studies will be done with graminaceous plants such as wheat and barley and research findings adapted to similar studies of various subtropical and temperate zone fruit plants. The correlations between nucleic acid, enzymes, and stress resistance will be determined; and will include RNA - synthesizing polymerase and the elucidation of the metabolic pathways through which water stress influences the synthesis of this enzyme in drought-resistant plants. The nature and distribution of plant lysosomes, the inherent centers of high concentrations of destructive catabolic enzymes, will also be studied. The effect of extreme external conditions of temperature & water upon reticulate and nucleoproteinous fine structures in the cell will be examined as will the stability of catabolic centers associated with these fine structures. Biochemical laboratory assay methods will be developed to determine the relative degree of stress resistance of a given plant or type. Chemical agents which can induce drought and cold hardening processes or otherwise stabilize the fine cellular structures and catabolic enzyme centers under unfavorable conditions will be sought, developed and field tested.

SUPPORTED BY U.S. Dept. of Agriculture

2.0501, INFLUENCE OF PLANT AND ENVIRONMENTAL FACTORS ON PHOTOSYNTHESIS, STOMATAL APERTURE AND TRANSPIRATION

E. SHMUELI, Volcani Inst. of Agric Res., Rehovot, Israel

Object: To (1) study stomatal aperture and gaseous exchange of the plant as influenced by the internal water potential of the plant, and the energy status of water in the rooting medium and in the atmosphere, and (2) basic aspects of diffusion through the stomata and the whole leaf, and (3) to develop field techniques to measure stomatal aperture to gauge irrigation needs.

Plan of Work: Study will be made of the effect of stomatal aperture on gaseous exchange of plants, and an assay developed for stomatal aperture as an indicator of the need for irrigation. Relevant soil, plant, and atmosphere parameters coupled with plant responses will be measured over short periods under semicontrolled conditions. Parameters to be measured or evaluated are for the soil: moisture content, water potential and hydraulic conductivity; for the atmosphere: air temperature, humidity, wind flow and net radiation flux; and for the plant: leaf gaseous diffusion, stomatal aperture, stomatal resistance, transpiration, photosynthesis, respiration, growth, water potential of the plant tissue, and leaf temperature. It will contribute significantly toward understanding the role of the plant in the hydrological cycle and thus increase our potential for water conservation.

2.0505, WATER UTILIZATION ASPECTS OF WEATHER MODIFICATION AS APPLIED TO KANSAS

R.L. SMITH, Univ. of Kansas, School of Engineering, Lawrence, Kansas 66045

The primary objective of this study is to ascertain the relative magnitude of incremental precipitation (weather modification) required to produce significant water management results in Kansas.

A digital model of the hydrologic cycle is being used to study the probable response to augmented precipitation patterns. Four Kansas basins, representing a variety of climatic, geologic, and hydrologic conditions will be studied. A variety of rainfall augmentation patterns will be utilized. These will range from a simple percentage increase in the historic record to the use of random variables and selected operational constraints reflective of the water management and control needs of the area. Comparative analysis of the various model runs is expected to give some insight to the degree of weather modification needed to provide measurable improvement in water supplies for various beneficial uses.

2.0510, THE ECONOMIC EFFECTS OF DROUGHT ON AN AGRICULTURAL ECONOMY

O. BULLER, Kansas State University, Graduate School, Manhattan, Kansas 66504

1. To evaluate the economic effects of drought on farms and to rural communities and, if possible, to improve some existing strategies used by farmers and to derive improved strategies to minimize the effects of drought on farm firm; 2. To derive estimates of the effect of weather as compared with other inputs, in the production of the most important crops grown in the great Plains.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0511, ECONOMICS OF CLIMATE

O. BULLER, Kansas State University, School of Agriculture, Manhattan, Kansas 66504

Analysis of the economic effects of weather variability on Kansas farm income began with the study of the relationship between crop yields and weather variables. Due to climatic differences and form in which data was available, the analyses considered Kansas as nine crop reported districts.

Crops considered in Western Kansas were wheat and grain sorghum; in Central Kansas, wheat, grain sorghum and corn; in Eastern Kansas, wheat grain sorghum, corn and soybeans. A good statistical relationship was for crops and weather variables, but not for livestock production and weather.

Relationship between crop yield and weather were easier to establish in Western Kansas than in Eastern Kansas. Weather variables used in Western Kansas were indexes established by Wayne Palmer and reported in 'Meteorological Drought,' research paper number 45, U.S. Department of Commerce, Weather Bureau. Weather variables in Eastern Kansas were based on a measure of evapotranspiration rate.

The influence of weather on farm income has been relatively favorable in Eastern Kansas but has had an adverse affect in Western Kansas.

2.0513, ECOLOGICAL STUDIES OF GRASSLANDS, ETC.

L.C. HULBERT, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

Description of Work: The major emphasis is on the delineation and description of the plant communities in the true prairie of the Flint Hills of Kansas. Areas are selected possessing different site conditions (ridge tops, rocky slopes, gently sloping deep soil, etc.) and different treatments (ungrazed and grazed, burned and unburned, unmowed and annually mowed). On these areas canopy coverage of each species of vascular plant is measured. From these data the expected composition under different conditions will be compiled, and the effect of different treatments on each species will be interpreted.

Relationships and causes of the relationships among the plants of the communities will be studied more after the communities are known.

2.0514, GROUND WATER RECHARGE THROUGH PITS AND WELLS

H.L. MANGES, Kansas State University, School of Engineering, Manhattan, Kansas 66504

Irrigation development increases the drainage problem in areas with poor natural surface drainage. An alternative to an organized Drainage District is to dispose of excess water by recharge into the underground aquifer. This can be accomplished by pits or wells if suspended material is removed from the surface water.

A series of recharge pits will be dug to the top of the underground aquifer. The pits will be backfilled with a filter material. Various materials, including fiberglass, sands and gravels, will be evaluated in the laboratory before selecting a filter design for field trails.

Underground draitile will be installed to determine if the natural soil profile can be used as an effective filter for removing suspended particles from surface runoff water. Runoff from rainfall and irrigation will be diverted onto the area and the flow rate and amount of suspended sediment determined.

The potential recharge rate of a selected aquifer will be determined. Water will be pumped from an existing irrigation well into a recharge well.

The work will be accomplished at Kansas State University, Manhattan, and the Sandyland Irrigation Field at St. John, Kansas.

2.0515, ZOOPLANKTON NUTRITION IN LARGE RESERVOIRS

G.R. MARZOLF, Kansas State University, Graduate School, Manhattan, Kansas 66504

The utilization of aquatic bacteria as a food source for zooplankton is suspected in reservoirs where low light penetration limits primary production. Study of the nutrition of the exceptionally large zooplankton populations living in these environments will add significant information to the flow of energy thru reservoirs and to role of bacteria generally in surface waters. The approach will be that of measuring the efficacy of bacterial, algal, and detrital feeding by populations of zooplankton in laboratory. This will be estimated by monitoring population attributes (i.e., birth rates, and death rates) rather than dealing with individuals. The experiments will be conducted under controlled temperature conditions, using food sources of known quantity and caloric content.

SUPPORTED BY U.S. National Science Foundation

2.0516, MICROMETEOROLOGICAL INVESTIGATIONS OF THE ENERGY BUDGET - EFFECT OF SUMMER WINDS

E.L. SKIDMORE, Kansas State University, School of Agriculture, Manhattan, Kansas 66504

The influence of summer winds on energy budget in semiarid agricultural regions will be characterized and effectiveness of slat-fence windbreaks in reducing windspeed and evapotranspiration determined. Eight-foot-tall slat fence will be installed perpendicular to direction of prevailing summer wind about midfield. Observations stations will be established at 6H windward and 2, 6, and 12H leeward of the windbreak (H equal height of windbreak). Measurement of temperature, humidity, and windspeed gradients, net radiation, and soil heat flux density will be obtained at each observation station and used to compute energy balance. Observations will be made at various levels of windspeed and soil moisture.

2.0517, IMPACTS OF DROUGHT ON LOCAL ECONOMIES IN KANSAS

M.D. SKOLD, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

Objectives: 1. Identify and measure the occurrence, duration, and intensity of recent historical agricultural droughts in Southwest Kansas. 2. Analyze the direct effects of these droughts on the composition and level of farm output and income. 3. Analyze the indirect effects of these droughts on the levels and flows of income in agriculturally related industries in local economies. 4. Assess the extent to which improved agricultural water management practices might have reduced the direct and indirect economic effects of droughts.

Rather than attempt to establish a new technique for measuring drought, plans are to adopt a technique already developed and test it as to its ability to relate to changes in agriculture that occur as a consequence of drought. These agricultural adjustments will be analyzed as to their effect upon the local economy and perhaps to certain sectors of the local economy.

2.0519, DEVELOPMENT OF A PRACTICAL METHOD OF LOCATING AND TRACING SEEPAGE WATER IN UNSTABLE SLOPES

J.H. HAVENS, State Dept. of Highways, Frankfort, Kentucky

Recurrence of movement in slide areas during wet weather is indicative of troublesome underground seepage which is often associated with stratified shales in side-hill cuts and benched, side-hill embankments. In order to evaluate such situations and to methodically undertake corrective repairs, it is essential that the source of the seepage be located and diverted. A systematic investigation of each slide would thus obviate trial-and-error methods which are often expensive and disheartening. The project is primarily a field study of existing slides. A procedure for determining the source of seepage water associated with unstable slopes is being developed.

Work has been started to develop a technique of using an electrical resistivity method to locate and trace seepage water in a landslide.

Preliminary indications are that four-probe resistivity data may be used to trace water as well as geologic strata with only a minimum of drill-hole data.

Reports Issued: Development of a practical method of locating and tracing seepage water in unstable slopes, R. C. Deen, Status Report of Landslide Area on I-75, Covington, Kentucky, Highway Research Laboratory, Kentucky Dept. of Highways, May 15, 1963.

Development of a practical method of locating and tracing seepage water in unstable slopes, R. C. Deen, Part II, Status Report on Landslide Area on I-75, Covington, Kentucky, Highway Research Laboratory, Kentucky Dept. of Highways, Aug. 1, 1963.

2.0520, STUDY OF RUNOFF FROM SMALL DRAINAGE AREAS

J.H. HAVENS, State Dept. of Highways, Frankfort, Kentucky

Extensive records are available in reference to the rainfall runoff relationships for the larger watersheds throughout the state. However, little data are available in regard to these relationships for the smaller watersheds. The major portion of expenditures for drainage facilities on most highway projects goes toward provision for drainage from the smaller areas. It is thus desirable to obtain reliable rainfall-runoff relationships for the smaller areas and to develop a design criterion on the basis of these relationships. Intensity-duration curves are available for the entire state and, with minor revisions to correct for the greater years of records presently available, they should be incorporated into a criterion developed as mentioned.

Reports Issued: Report No 1 on a study of runoff from small drainage areas and the openings in attendant drainage structures, E.M. West and J.D. Cornell, Highway Res. Lab., Ky. Dept. of highways, April 1952. Report No 2 on a study of runoff from small drainage areas and the openings in attendant drainage structures, E.M. West and W.H. Sammons Highway Res. Lab., Ky. Dept. of Highways, July 1955.

2.0521, PLANT SOIL MOISTURE ENVIRONMENT AND ITS EFFECT ON WATER MOVEMENT INTO PLANT ROOTS

C.T. HAAN, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

Objectives of Research: 1. Develop a means of controlling soil moisture so that plants can be grown at controlled levels of soil moisture stress. 2. Develop a mathematical model of water movement from the soil into the plant root.

Summary: Studies on water stress of plants have been hampered by the lack of an adequate means of controlling the water potential in soils within narrow limits at high values of moisture tension. Part of the work of this project will be devoted to testing several methods of overcoming this obstacle.

The second part of the project will be devoted to a study of moisture movement through the soil into plant roots when the soil moisture is controlled at several levels of moisture potential and the aerial environment of the plant is controlled at one level in a growth chamber. A mathematical model of moisture movement into plant roots under these conditions will be developed and tested.

2.0522, UNSTEADY FLOW TOWARD PARTIALLY PENETRATING ARTESIAN WELLS

Y.H. HUANG, Univ. of Kentucky, Water Resources Institute, Lexington, Kentucky 40506

Current solutions for unsteady flow toward partially penetrating artesian wells are based on many ideal assumptions. Among these assumptions are that (a) the aquifer is elastic, homogeneous, isotropic, horizontal in position, uniform in thickness, and infinite in extent, (b) the well is of a small radius, and (c) the discharge from the well does not vary with time. Since actual field conditions may not fulfill the above assumptions, these solutions may be of limited application.

The objectives of the proposed research are twofold: (a) to develop a numerical procedure using a finite difference method and a high speed computer for the analysis of unsteady flow toward partially penetrating artesian wells so that solutions for uses other than those ideally assumed can be obtained, and (b) to construct a test model having the same dimensions as those assumed in the theoretical analysis and check the validity of the theory.

2.0523, COMPUTER ANALYSIS OF WATERSHED CHARACTERISTICS AFFECTING FLOOD HYDROLOGY

L.D. JAMES, Univ. of Kentucky, School of Engineering, Lexington, Kentucky 40506

A computer program known as the Stanford Watershed Model has been developed for generating long term streamflow values from rainfall records and parameters describing watershed characteristics as determined by a trial and error process of adjustment to match short term streamflow records. The research plan is to 1. Program a computerized procedure for finding the best value for these parameters from the standpoint of flood analysis. 2. Apply the procedure to a number of small watersheds to see how the selected values vary and to develop relationships expressing flood peaks and volumes as functions of these parameters. 3. Apply the results to a computer program previously developed by the principal investigator for determining by economic efficiency criteria the best combination of structural and nonstructural measures for flood control to analyze how this best combination varies with these watershed parameters.

2.0524, CRITERIA FOR EVALUATION AND FUNCTIONAL DESIGN OF IRRIGATION SYSTEMS

J.T. LIGON, Univ. of Kentucky, Agricultural Experiment Sta., Lexington, Kentucky 40506

1. To determine the effects of moisture stress on the rate of growth, development, final yield and quality of certain potentially irrigable crops. 2. To determine the soil moisture withdrawal patterns for certain potentially irrigable crops. 3. To determine the water intake rates of typical Kentucky soils and their relationships to other measurable physical quantities. 4. To determine from climatological data the frequency of occurrence of various levels of soil moisture deficiency during the growing season in Kentucky.

Emphasis will be placed on the acquisition and analysis of basic data pertaining to the interactions between water, soil, climate, and plants as related to supplement irrigation. The overall objective is to develop dependable criteria for the evaluation of irrigation needs and the functional design of irrigation systems.

2.0525, CAPILLARY-DIFFUSION AND SELF-DIFFUSION OF LIQUID WATER IN UNSATURATED SOIL

R.E. PHILLIPS, Univ. of Kentucky, School of Agriculture, Lexington, Kentucky 40506

Objectives of the Project: 1. To evaluate the effect of soil water content, clay type, and clay content upon the capillary-diffusion and self-diffusion of liquid water in unsaturated soil. 2. To attempt to establish a functional relationship between capillary-diffusion and self-diffusion of liquid water in unsaturated soil.

Summary: The movement of liquid water within the unsaturated soil is a key mechanism in the process of evapo-transpiration. Evapo-transpiration, in turn, is an important controlling factor in the hydrologic cycle. At the present time, our knowledge of the mechanics of soil water movement in unsaturated soils and the factors controlling it is of a qualitative nature rather than of a quantitative nature.

In this study the movement of water in unsaturated soils and some of the basic soil properties affecting soil water movement will be studied. The movement of water within the soil mass is the initial step in the process of evapo-transpiration. Both capillary-diffusion coefficients and self-diffusion coefficients will be measured to characterize soil water movement. The measurement and understanding of capillary-diffusion coefficients, especially with reference to the mobility of the water molecule as affected by soil properties. In the past, the interpretation and prediction of soil water movement in unsaturated soil has been based upon capillary-diffusion coefficients.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Kentucky

2.0526, DIFFUSION OF WATER AND IONS IN SOIL

R.E. PHILLIPS, Univ. of Kentucky, Agricultural Experiment Sta., Lexington, Kentucky 40506

1. To determine the effect of physical, mineralogical, and chemical properties of soils on the self diffusion of water and plant nutrient ions in soils. 2. To investigate interactions which are likely to exist between particular physical, mineralogical, and chemical properties of soils when either water or plant nutrient ions are diffusing in soil. 3. To compare the magnitude of molecular-self diffusion coefficients of water in soil to the diffusion coefficients of water defined as the product of capillary conductivity and the rate of change of soil water tension with soil water content.

Diffusion coefficients of water and plant nutrient ions as affected by soil properties will be evaluated. Soil properties to be studied include: soil water content, clay mineralogy, soil texture, soil compaction, soil temperature, organic matter content, and cation population. Interactions existing between these soil properties when either water or ions are diffusing will be evaluated. Both molecular- diffusion coefficients and capillary potential gradient-diffusion coefficients of water in soil will be measured.

2.0527, HYDROLOGY OF BURIED PENNSYLVANIAN CHANNEL SANDSTONE, KENTUCKY

R.W. DAVIS, U.S. Dept. of Interior, Water Resources Division, Louisville, Kentucky

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Kentucky.

Purpose: To obtain adequate information on the geohydrology of the deeply buried basal Pennsylvanian channel sandstones and the relation of deep fresh water to saline water in the Western Coal Field area to guide future development and proper management of water resources.

Method: Detailed information on the geology and hydrology of the channel sandstones will be obtained by inventory of currently available sources, such as existing water and oil wells, coal-test holes, and geologic maps. The trend, distribution, and volume of the channel sandstones will be presented on maps, fence diagrams, and sections. The movement of ground water through the sandstones will be documented by means of water-level information, pumping tests, and streamflow measurements. The relationship of large-yielding wells to the occurrence of the sandstone and channel geometry will be analyzed. Water samples will be collected to delineate the areas of fresh water and periodic sampling will be made near centers of pumping to document effects of pumping on quality.

2.0528, WATER RESOURCES OF THE BOWLING GREEN AREA, KENTUCKY

T.W. LAMBERT, U.S. Dept. of Interior, Water Resources Division, Louisville, Kentucky

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Kentucky.

Purpose: To provide information on the quantity and quality of the water in the Bowling Green area for use in planning additional industrial development.

Methods: Detailed information on ground-water sources will be collected with particular emphasis on delineating the areas of potentially high yield. The investigation will include a study of the underground flow patterns and potential sources of contamination. Information on water quality of streams and aquifers will be collected and changes in water quality monitored. The relation-

2. WATER CYCLE

ship between ground water and water in streams is particularly significant because of large base flows and recurrent flooding of large solution channels by high river stages. Partial-record stations will be operated on tributary streams for correlation of record with the gaging and water-quality station on Barren River at Bowling Green.

2.0529, A DETAILED STUDY OF THE ENERGY FLOW THROUGH THE BIOTA OF DOE RUN, MEADE COUNTY, KENTUCKY

L.A. KRUMHOLZ, Univ. of Louisville, Graduate School, Louisville, Kentucky 40208 (AT(40-1)-3540)

Doe Run, a stream that arises as a torrent spring, has been studied intensively since 1959. Background data indicate that the uptake of fission products from nuclear fallout was quite prompt following the Russian and American tests that began in 1961. That accumulation reached a maximum by 1964 and by the summer of 1966 the amounts in the biota had returned essentially to the 1960 levels. On the basis of these background data it was proposed to try to define the pathways of accumulation of radioisotopes of biologically important fission products and their possible relationships to energy flow through the stream ecosystem.

As a part of this study, Doe Run has been inoculated with cesium 134 three times: 10 mc on 17 December 1966, 25 mc on 17 June 1967, and 25 mc on 16 December 1967. Physical characteristics of the stream were different during each inoculation, and data on stream flow indicate that at low discharge (ca 20 cfs, June 1967) the 'slug' of cesium moved very slowly and became greatly elongated as it passed downstream, whereas at high discharge (ca 85 cfs, December 1967) the slug moved quite rapidly and remained quite compact.

Calorific values of various plants remained constant throughout the year, but there was a gradual marked decline in calorific values of some amphipods. Data on respiration indicate that oxygen consumption by some stream invertebrates fluctuates with no seasonal pattern or relationship to inoculation of the stream. Smaller individuals of each species consume oxygen at relatively higher rates than larger individuals of the same species.

2.0530, GEOCHEMISTRY OF AQUIFERS AS AFFECTED, OR POTENTIALLY AFFECTED BY OFFTAKE OR ARTIFICIAL RECHARGE

G.K. BILLINGS, Louisiana State University, Graduate School, Baton Rouge, Louisiana 70803

It is proposed to determine the chemical parameters significant to such existing problems as: a) salt water encroachment; b) river water encroachment; and c) injection water. Potentiometric and atomic absorption methods will be used to determine the variables. Analyses will be made on samples of precipitation, runoff, and ground water at recharge, discharge, and potential mixing sites. Analyses will be made of experimentally filtered water in contact with proposed storage aquifers and of aquifer solid material. Data will be used in the examination of such problems as watermass mixing, rock-water equilibrium, and potential alteration of water quality by proposed engineering manipulation of the Baton Rouge water system. Information gained is highly extrapolatable to other Gulf Coast areas.

2.0532, EROSION CONTROL STUDY

A.L. COX, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

Present methods are being evaluated to develop new methods and equipment for establishment of a permanent sod cover. Erosion control practices are being developed for existing highway drains and ditches and highway bank stabilization methods that do not require top soil from adjacent agricultural lands. Structures are installed at various locations to incorporate soils, slopes and length of run in order to obtain detail information on the amount of soil lost. To prevent erosion sod drains, slopes and materials such as chemicals and mats are being installed. Soil and water loss are being studied to determine the correct slope and length of ditches for various soils. An attempt is being made to evaluate sodded, asphalt paved, concrete paved and other types of waterway to establish the best type under different conditions. Recommendations will be made to the Louisiana highway department for the revision of erosion control and sod establishment practices.

2.0533, ROW CROP IRRIGATION IN NORTHWEST LOUISIANA - COTTON IRRIGATION

J.W. ROBBINS, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

1. To determine crop response to irrigation in Northwest La.
 2. To determine evapotranspiration rate of the crops irrigated.
- Will continue test plots on irrigated and non-irrigated cotton for yield study and continue study of evapotranspiration of cotton in this area.

SUPPORTED BY Louisiana State Government

2.0534, ROW CROP IRRIGATION IN NORTHEAST LOUISIANA

J.W. ROBBINS, Louisiana State University, Agricultural Experiment Sta., Baton Rouge, Louisiana 70803

To determine the following concerning cotton and corn under irrigation in northeast Louisiana: 1. Economics of row crop irrigation. 2. Evapotranspiration rates. 3. Optimum plant population.

Continue study of yield data of different varieties of cotton in the Macon Ridge area. This includes land forming plots for furrow irrigation study, selection of varieties for testing and continuing study of evapotranspiration in the cotton area. Revise project after this year.

SUPPORTED BY Louisiana State Government

2.0535, BAYOU LAFOURCHE SEDIMENTATION STUDY, LOUISIANA

W.H. BOYLE, U.S. Dept. of Interior, Water Resources Division, Baton Rouge, Louisiana

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Louisiana.

Purpose: To determine the rate of sedimentation and the resulting channel characteristics such as size, shape, and slope.

Methods: A quantitative analysis of data collected by the U. S. Geological Survey and other agencies since 1955 will be initiated so that an estimate of the amount of sediment coming into the bayou can be made. This estimate will be compared to an amount derived by using a gamma probe at 18 cross-sections within the study reach by which the density of the sediment at each cross-section is obtained. Finally a prediction of the stabilized channel will be made for the bayou within the study reach.

2.0536, GEOLOGIC STRUCTURE AND FRESH GROUND WATER IN GULF COASTAL PLAIN

P.H. JONES, U.S. Dept. of Interior, Geological Survey, Baton Rouge, Louisiana

Major elements of structural deformation in the Gulf Coast Plain that have marked effect on deposits of post-Oligocene age will be identified and mapped at a suitable scale, together with the distribution (areally and with depth) of fresh and saline waters in aquifer systems affected by the deformation. The relative importance of individual structural features, together with companion features (e.g. regional normal faults and associated salt domes) will be evaluated using this map, and key structures in the Plain will be selected for intensive study. These type studies will involve all geologic and hydrologic factors for which data can be obtained, and each will be completed with a separate report. Concepts derived and analytical methods developed in the type studies will be employed in a comprehensive analysis of conditions throughout the Plains. The report on this work will include structural maps for entire aquifer systems and flow nets for principal aquifers; it will show the locus and hydraulic controls on salty water in proximity to fresh-water systems, and define, as well as may be possible, the probable consequences of changes in direction of flow and gradient in head in aquifer systems subjected to heavy withdrawal in the future.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0537, FLOODS IN NORTH LOUISIANA - RAINFALL-RUNOFF RELATIONSHIPS

F.N. LEE, U.S. Dept. of Interior, Water Resources Division, Baton Rouge, Louisiana

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Louisiana.

Purpose: To determine the relationship between rainfall and runoff in northern Louisiana as a part of a program to provide statewide coverage.

Methods: Regressions will be made from rainfall-runoff data computed at 34 gaging stations. Approximately 1700 storms will be analyzed, and the regressions regionalized.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0541, FLOOD FREQUENCY OF SMALL STREAMS IN LOUISIANA

UNKNOWN, U.S. Dept. of Interior, Geological Survey, Baton Rouge, Louisiana

This research proposal is to obtain and analyze hydrologic data which can be used in the hydrologic design of highway drainage structures. More specifically, to determine the magnitude and frequency of floods for drainage areas requiring culverts in Louisiana. Project will consist of 75 flood hydrograph recording stations. These gages will be installed within a three year period. The gages will be located throughout the state so that many different parameters will be sampled. In addition to flood hydrographs, information will be obtained on amount and distribution of rainfall, land use, basin slope and stream slope. The gaging equipment will consist of rainfall and stage /RS/ recorders and creststage gages upstream and downstream at each site.

Objectives: 1. Determine the distribution and density of the fauna of the phase area. 2. Determine the hydrography of the phase area. 3. Process the data.

Procedures and Work Schedule: 1. Weekly plankton sampling in the major passes and throughout the system with a 6-foot beam plankton net. 2. Weekly sampling throughout the major nursery areas with a 6-foot 1/4' mesh trawl. 3. Bi-weekly sampling throughout the major nursery and near off-shore areas with trawls. 4. Bi-weekly sampling at selected sites. 5. Monthly benthic sampling at selected sites. 6. Collection of selected hydrographic information at each sample station and continuous hydrographic information at each sample station and continuous recordings of salinity temperature and tidal movements at selected stations. 7. The processing, tabulating and summarizing of collections and raw data which are to be transmitted to the project leader at the marine laboratory for compilations, analysis and interpretation.

2.0548, CHEMICAL AND PHYSICAL ANALYSES OF WATER AND SOILS

K.E. LANTZ, State Wildlife & Fish Comm., New Orleans, Louisiana

Objectives: 1. To determine physical and chemical characteristics of water in the four lakes prior to fluctuation, during the water level changes and following fluctuation when water levels return to normal. 2. To determine chemical conditions of bottom muds in the four lakes prior to water fluctuation and chemical conditions in the soils exposed to aeration during the drawdown period.

Procedure: Water chemistries will include turbidity, dissolved oxygen, free carbon dioxide, pH, alkalinity, hardness, sulfate, iron, copper, manganese, phosphate, ammonium nitrogen, nitrate nitrogen and nitrite nitrogen. These measurements will be made with a Hach Direct Reading Colorimeter. Sampling will be monthly in the spring prior to fluctuation, monthly during the water level changes, and monthly in the winter when water levels return to normal.

Soil samples will be collected at the same time as water samples and dried for measurement for pH, phosphorus, potassium, magnesium, calcium and total soluble salts. Analyses will be conducted by the Soils Testing Laboratory at Louisiana State University. A Coleman Flame photometer, Beckman atomic absorption spectrophotometer, and Bausch and Lomb Spectronic 20 Colorimeter will be used to analyze these bottom muds.

2.0550, MOISTURE RESPONSE OF SOILS

H.K. HUCKABAY, Louisiana Polytechnic Inst., School of Engineering, Ruston, Louisiana 71270

An apparatus is to be developed which will be sufficiently accurate to measure the capillary potential of various representative

2. WATER CYCLE

Louisiana soils but not so fragile or ponderous as to make it impractical for field use. In development of the apparatus, the literature will be searched and various proposed designs considered. These will be modified or discarded in the light of current instrumentation techniques, thermodynamics, and rate process theory. Preliminary designs will be constructed, tested, and discarded or modified. This screening of alternate designs may require the preparation of some type of artificial reference soil. In any case, the criteria of performance will be: (1) Reproducibility of reading, (2) Portability, (3) Durability, (4) Rapidity of reading, and (5) Low cost. It is anticipated that the final design will be the optimum combination of these factors.

2.0552, HYDROLOGIC RELATIONSHIPS IN A CONIFEROUS FOREST

C.E. SCHOMAKER, Univ. of Maine, Graduate School, Orono, Maine 04473

This investigation proposes to study the water budget of a coniferous forest in central Maine, taking particular note of evapotranspiration losses and changes in ground water storage in relation to the quantity of incoming precipitation.

Environmental measuring instruments will be located in a mature conifer stand with normal stocking. Ground water wells will be drilled and soil moisture measurements made throughout the year. Precipitation will be traced from the time of its inception until it appears in the ground water or is lost from the area by evaporation or runoff.

2.0553, EFFECTS OF COARSE SKELETON ON PHYSICAL PROPERTIES OF SOIL

R.A. STRUCHTEMEYER, Univ. of Maine, Agricultural Experiment Sta., Orono, Maine 04473

Description of Work: Runoff plots will be installed on a caribou loam in Aroostook County. All plots have a uniform eight per cent slope.

Soil treatments will consist of leaving the soil in its natural condition, removing rocks over 1 1/2 inches in diameter and removing rocks but then crushing them and returning them to the plots.

Measurements will be made of the amount of runoff and soil removal. Bulk density and penetrometer measurements will also be made throughout the season.

2.0555, STUDIES OF NEAR-SURFACE SEDIMENTS IN LAKES, AND RELATIONSHIPS BETWEEN SURFACE SEDIMENT POLLEN SPECTRA AND VEGETATION

R.B. DAVIS, Colby College, Undergraduate School, Waterville, Maine 04901

From the time of release of pollen from plants to the time the grains become deeply buried in sediments numerous processes occur which determine the 'final' pollen representation in the sediments. Understanding these processes is essential if the capacity of pollen analysis to provide paleoecological information is to be greatly extended.

It is proposed to continue investigation of phenomena taking place in the surface and near-surface sediments of lakes, and to continue work on the relationships between vegetation and pollen spectra, viz: A. Pollen stratigraphy in near-surface sediments, especially vertical displacement of sediments by benthos, laboratory and field experiments; construction of new corer and associated equipment. B. Differential destruction of pollen in sediments, including pollen breakage by various taxa of benthos, laboratory and field experiments; relationship of limnological conditions to pollen destruction. C. Comparisons of surface pollen spectra and vegetation along transects crossing vegetational 'zones,' and within single vegetational types for study of variation in spectra and related pollen dispersal phenomena; New England and Maritime Provinces of Canada.

2.0556, THE BIOLOGY AND CHEMISTRY OF TRACE ELEMENTS IN MARINE AND ESTUARINE WATERS

W.R. TAYLOR, Johns Hopkins University, Graduate School, Annapolis, Maryland (AT(30-1)-3497)

The objective of the project is to clarify the biogeochemical cycles of trace elements through the initial trophic levels of the Chesapeake Bay. Both biological and chemical samples have been collected in the major river entering the upper Chesapeake Bay and a series of stations in the Bay. Chemical analyses are done by atomic absorption spectrophotometry. Both phytoplankton and zooplankton organisms are being surveyed quantitatively for spatial and time distribution patterns.

The chemical sampling program is nearly complete. Analyses for iron, manganese, copper, nickel, zinc and cobalt have been partially completed. The trace metal requirements of representative phytoplankton organisms are being investigated. An iron requirement has been found for five algae. Cladocerans appear to be a major component of the zooplankton.

2.0557, SUSPENDED SEDIMENTS IN THE UPPER CHESAPEAKE BAY - EVALUATION OF METHODS FOR SIZE ANALYSIS OF SUSPENDED MATERIALS

J.H. MANNING, State Dept. of Ches. Bay Affs., Annapolis, Maryland

The objective of this study is to determine the method or combination of methods which provides the most consistent data on the size distribution of the suspended material in the Upper Chesapeake Bay, for use as a routine procedure. Large volume samples from the Upper Bay will be divided into several sub-samples. One sub-sample will be spun down in an ultra-centrifuge, and the sediment homogeneously resuspended in a reduced volume. Size distribution will be determined using the homogeneous technique in the Mine Safety Appliances Company's Particle Size Analyzer. A second sub-sample will be filtered through a 0.2 micron filter, the filter dissolved in acetone, and the sediments resuspended in the acetone. Size distribution of this resuspension will be determined using the layer technique. A third sub-sample will be filtered through a 3 micron membrane filter, and then through an 0.2 micron filter, in order to provide gross size separation. Microphotographs of the large filter, and both microphoto-

2. WATER CYCLE

graphs and electron-micro-photographs of the smaller filter will be made. A Zeiss Particle Size Analyzer will be used to obtain size distribution. Variations of each of the above techniques will be used in which the suspended organic fraction is eliminated from the raw sample by wet incineration. This study will be carried out by J. R. Schubel, Chesapeake Bay Institute, The Johns Hopkins University.

2.0558, FIELD MEASUREMENTS OF THE TEMPORAL AND SPATIAL VARIATIONS IN CONCENTRATION AND PARTICLE SIZE DISTRIBUTION OF SUSPENDED MATERIALS IN THE UPPER

J.H. MANNING, State Dept. of Ches. Bay Affs., Annapolis, Maryland

The objectives of this study are to determine the temporal and spatial variations in (1) the concentration; (2) particle size distribution; (3) percent organic matter; and (4) mineralogical composition of inorganic fraction. Samples will be collected at the surface, mid-depth and near the bottom at each of 31 stations in the Upper Chesapeake Bay from the mouth of the Susquehanna at Havre de Grace to just below Pooles Island, on a monthly basis. Total weight of suspended material per unit volume, and weight of inorganic fraction will be determined. Size distribution of the suspended material will be determined using the methods selected on the basis of the evaluation study conducted under another phase of this project. Work will also be initiated on mineralogical analysis of the inorganic fraction, although the major effort on this part of the program will be undertaken during the second year of the study. Field work will be carried out aboard the research vessels MAURY and LYDIA LOUISEII, of the Chesapeake Bay Institute, The Johns Hopkins University. The study will be conducted by J. R. Schubel, Chesapeake Bay Institute, The Johns Hopkins University.

2.0559, COMPARISON OF OPTICAL PROPERTIES WITH DIRECT MEASUREMENTS OF CONCENTRATION AND SIZE DISTRIBUTION OF SUSPENDED MATERIALS

J.H. MANNING, State Dept. of Ches. Bay Affs., Annapolis, Maryland

The objective of this study is to determine the relationships between various optical properties of the waters of the Upper Chesapeake Bay and the concentration and size distribution of suspended materials in these waters. At each of 31 stations in the Upper Bay samples will be collected at three depths and at monthly intervals for determination of suspended particle concentration and size distribution, as described under another phase of this project. Duplicate samples will also be employed for light transmission and scattering measurements at each of three wave lengths. Scattering measurements will be made at 90° to the light beam path using a Turner filter fluorometer. Beam transmittance measurements will be made using a Beckman DU spectrophotometer with a special narrow beam columnation attachment. In situ measurements of beam transmittance will also be made. These optical measurements will be compared with the determinations of suspended particle concentration and size distribution, with the intent of establishing a relationship between the optical parameters and the suspended particle concentration and size distribution. This study will be conducted by J. Williams, J. R. Schubel, and D. W. Pritchard, Chesapeake Bay Institute, The Johns Hopkins University.

2.0563, PHYSIOGRAPHIC STUDY OF PART OF THE HENRY MOUNTAINS REGION, UTAH

C.B. HUNT, Johns Hopkins University, Graduate School, Baltimore, Maryland 21218

The Principal Investigator plans to complete research, supported under NSF grant GA-454, on the physiography of the Henry Mountains, Utah. Principal objectives of the research are: to determine relationships between the bedrock geology, kinds and rates of weathering and of soil development, kinds and rates of fluvial processes, effects of these on plant distribution, and archeological evidence for dating changes and estimating rates in geomorphic processes. The investigations will center largely on a small part of the Henry Mountain area, especially the north and east sides of Mount Ellen and the pedimented foothills north and east of that mountain.

The high relief of the Henry Mountains provides contrasting climatic zones for comparison of weathering features and development of pediments, terraces and other landform features. In the continuing research emphasis will be placed on understanding geomorphic processes and testing of concepts of landform development, particularly as related to erosion and deposition by streams. It is hoped that datable archeological remains in some deposits will give a basis for determining absolute rates of deposition, and formation of landforms. In addition, it is hoped that information relative to the water budget, distribution of aquifers, and other factors important in potential land-use development will emerge from the research.

SUPPORTED BY U.S. National Science Foundation

2.0564, EVALUATION OF MAGOTHY AQUIFER - ANNAPOLIS AREA

F.K. MACK, Johns Hopkins University, State Geological Survey, Baltimore, Maryland 21218

2. WATER CYCLE

The City of Annapolis, Md. and other users pump from 3 to 5 million gallons of water per day from the Raritan and Magothy Formations in the Annapolis area. Because the demand for water is expected to increase substantially in the next 10 years further information is needed on the quantity of water available, the possibility of salt water contamination, and the optimum development of the supply. To provide this information it is proposed to: 1. Prepare cross-sections showing the geologic framework and local variations in the aquifer. 2. Prepare piezometric maps on a periodic basis. 3. Construct an electric analog model for analyzing the behavior of the hydrologic system. 4. Make studies of geochemical characteristics of the water.

2.0565, TIME OF TRAVEL - PRINCIPAL MARYLAND STREAMS

K.R. TAYLOR, Johns Hopkins University, State Geological Survey, Baltimore, Maryland 21218

The objective of this project is to provide water users with a time-of-travel guide to let them know when possible contaminants will reach their intakes, how long such contaminants will persist and at what levels of concentration if such contaminants are discharged accidentally into a stream. To obtain the time-of-travel data a fluorescent dye is put in selected streams, and the time of arrival measured for the leading edge, the maximum concentration and the time of passage at successive downstream locations. By such determinations at selected rates of discharge a relationship between discharge and time-of-travel is being developed for principal Maryland streams.

2.0567, SOURCES, MOVEMENT, AND DISTRIBUTION OF SEDIMENT IN A SMALL WATERSHED

M.G. WOLMAN, Johns Hopkins University, Graduate School, Baltimore, Maryland 21218

The proposed study will be directed toward an understanding of the system by which sediment is removed from upland surfaces and makes its way downstream and thence out of a drainage basin. The proposed research will test the fundamental working hypothesis in geomorphology which states that under normal circumstances a kind of equilibrium exists in the landforms within an area. This hypothesis further postulates that landforms change only very slowly, and that over relatively short periods of time the forms are so adjusted to the existing processes that material eroded from the landscape is transported throughout the drainage system without producing major changes in the forms of hill slopes, valley bottoms and river channels.

SUPPORTED BY U.S. National Science Foundation

2.0568, SOURCES, MOVEMENT, AND DISTRIBUTION OF SEDIMENT IN A SMALL WATER SHED

M.G. WOLMAN, U.S. Dept. of Interior, Water Resources Division, Baltimore, Maryland 21218

Recent studies of delivery of sediment from watersheds indicate that in many cases the computed quantity of sediment

which leaves the surface of a drainage basin may be considerably more than the amount of sediment delivered to reservoirs at some downstream location, taking into account the trap efficiency of the latter.

This study is directed toward an understanding of the system by which sediment is removed from the upland surfaces and makes its way downstream and thence out of the drainage basin. It has been suggested in the literature that the flood plain acts as a storage site for the intermittent movement of sediment throughout the stream system. Before sediment reaches the stream system from the hill slopes, however, it may pass either from hill slope to stream channel or through an intermediate stage represented by the colluvium at the valley margins. This stage of colluvium and flood-plain storage and migration is perhaps the least well understood portion of the system.

Stream flow and sediment discharge are being measured at two locations, one located directly below a source area of 100 acres of agricultural crop land, the other downstream at one square mile. Most of the intervening area is forested thus providing relatively little additional sediment inflow. Comparisons of particle size and sediment load by individual storms are being made. In addition, measurements of channel cross sections, particle movement, and slope processes are being made. Geomorphic studies including both stratigraphic observations and mapping are being undertaken to establish long term trends and history in the drainage basin as a basis for evaluating and extrapolating relatively short term measurements.

2.0569, EXTENT OF BRACKISH WATER IN TIDAL RIVERS, MARYLAND

S.G. HEIDEL, U.S. Dept. of Interior, Water Resources Division, Baltimore - Towson, Maryland

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Maryland.

Purpose: To delineate the boundary zone between brackish and fresh water and provide information to permit maximum utilization of the water in the tidal portions of Maryland rivers.

Methods: Location of the saline water front in all the inland tidal areas of Maryland at varying conditions of tide and runoff and different seasons of the year will be determined through use of continuous conductivity recorders, periodic spot measurements of chloride concentrations and determination of river profiles of salinities. A comprehensive report will be prepared on the extent and variation of the salt water encroachment in surface waters on the basis of these field observations and available supplementary information.

2.0570, RICE CULTURE

C.R. ADAIR, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To determine the effect of time and method of seeding; time, method, and rate of application and ratio of the various fertilizer elements; and the effect of stage of maturity when harvested and of the temperature during the period of maturation on plant growth, grain yield and on chemical, physical and cooking characteristics of new rice varieties.

Plan of Work: Early, midseason and late maturing advanced breeding lines and standard commercial types of rice will be grown in a quadruplicated split-plot experiment with varieties as the main plots and fertilizer rates as the subplots. These experiments will be conducted in a similar manner at the southern rice stations although the amounts and time of application of the fertilizer and the varieties and selections used may differ slightly. In California, the same general plan will be used except the rice will be sown in water and different varieties used. The response to photo-period and temperatures will be determined by growing the various advanced breeding lines with standard commercial types in replicated plots sown at early, midseason and late dates. Similar experiments will be conducted in regard to seeding rates and methods, and effect of stage of maturity when harvested in quality characteristics.

2. WATER CYCLE

2.0572, PHYSIOLOGICAL STUDIES OF ALFALFA AS RELATED TO COLD AND HEAT TOLERANCE, DROUGHT RESISTANCE, AND FORAGE QUALITY AND YIELD *C.H. HANSON, U.S. Dept. of Agriculture, Beltsville, Maryland*

Object: To determine the effects of temperature, light, moisture stress, and other environmental factors on alfalfa growth and quality, and to study the physiological basis of resistance in alfalfa to drought, heat, cold, disease, and insects.

Plan of Work: Study will be made of (1) the effects of removal of alfalfa seed coats before grinding, length and severity of grinding, and addition of bovine serum albumin on oxidative phosphorylation, with attention to possible beneficial effects of serum albumin resulting from tying up lipid-like material which may inhibit respiration and phosphorylation. Correlations will be made between varietal differences in cold resistance and mitochondrial activity with alfalfa seedlings undergoing hardening. In the initial coumestrol experiment, Ranger alfalfa will be grown in sand nutrient cultures under three temperature regimens (95 degrees, 80 degrees and 65 degrees Fahrenheit during the 16-hour daily illumination period and 80 degrees, 65 degrees and 5-degrees Fahrenheit during the respective 8-hour dark periods. Light intensity will range from 1800 to 2000 foot-candles. A phosphorus level variable will be included. The alfalfa will be harvested at four stages of growth. At each sampling, plants will be divided into growing tips, leaves, stems, and flowers plus flower buds (when present), and coumestrol content determined. Other variables for study will include length of the photoperiod, moisture stress, other nutrients, and Rhizobium symbiosis.

SUPPORTED BY U.S. Dept. of Agriculture

2.0573, LABORATORY TESTING OF HYDRAULIC FORMULATIONS FOR OPEN CHANNEL FLOW *H.N. HOLTAN, U.S. Dept. of Agriculture, Beltsville, Maryland*

Object: To physically test flood routing equations derived from simultaneous solutions of equations for continuity of mass and motion; to relate deviations between observed and predicted flow depths to the second flow pattern developed during transition from channel to out-of-bank flow; and to test a reformulation of Manning's equation for estimating flow velocities.

Plan of Work: Tests will include two types of channel models-- straight rectangular channel in a rectangular flood plain and a meandering rectangular channel in a flood plain. Each channel flood plain geometry will be studied by varying channel width, depth, and roughness coefficient, width and roughness coefficient of the flood plain, and depth of the channel below the flood plain. Each channel geometry combination will be subjected to steady uniform flow, steady, nonuniform flow, and unsteady, nonuniform flow. For each test, the depth of flow, water surface topography, lateral and longitudinal velocity components will be measured and recorded on punch cards or tape for computer analysis.

2.0574, BREEDING AND EVALUATION OF IMPROVED VARIETIES OF PERENNIAL COOL-SEASON GRASSES ADAPTED TO SEMIARID AND ARID REGIONS *A. HOVIN, U.S. Dept. of Agriculture, Beltsville, Maryland*

Object: To select or develop by appropriate breeding methods superior varieties of the wheatgrasses, needlegrasses, and wildryes. Characteristics sought include increased productivi-

ty and persistence, seedling vigor, better seed size, shattering and lodging resistance, adaptation to specific environments, and disease and insect resistance.

Plan of work: Breeding methods which include inbreeding, hybridization, various types of progeny testing, and procedures for evaluating progeny response will be compared. The heritability of quantitative characters will be studied. The physiological response of strains will be studied. Interspecific and intergeneric crosses will be attempted in the search for superior adaptive characteristics and to create new forms for use in range revegetation. Particular emphasis will be devoted to increasing the range of adaptation of these grasses through hybridization and plant introduction. Regional tests will be developed and seed distributed to agencies interested in evaluating new experimental varieties. (1.6 pmy per yr.) Cooperation: Nebr., N. Dak., Okla., and Utah Agr. Expt. Stas; and others.

2.0575, BEHAVIOR AND FOOD PREFERENCES OF INTRODUCED ANNUAL FISHES IN RELATION TO MOSQUITOES *C.H. SCHMIDT, U.S. Dept. of Agriculture, Beltsville, Maryland*

Object: Basic studies are to be conducted at Riverside both in the laboratory and a well-equipped aquatic field-study station on food preferences, survival, habitat adaption, fecundity, prey-seeking ability, and competition with indigenous fishes of introduced annual fishes of the family Cyprinodontidae. Laboratory and field aquaria along with sampling equipment are available for these studies in Riverside. In both laboratory and field environments annual fishes will be studied to determine their feeding habits and their preferences for bottom or top feeding activity and their ability to reduce populations of different types and species of mosquitoes. The effects of temperature, pH, and desiccation on survival, egg hatch, and fecundity of annual fishes under both laboratory and field conditions will be studied. Aestivation and hibernation along with the effect of drying eggs will be studied at varying temperatures and with different soil types. Comparative feeding, behavior, and survival of annual fishes and the mosquito fish, *Gambusia affinis*, will be made in field aquaria.

SUPPORTED BY U.S. Dept. of Agriculture

2.0576, BIOLOGY AND CONTROL OF SALT-MARSH AND RICE-FIELD MOSQUITOES IN GULF COAST AREAS *C.H. SCHMIDT, U.S. Dept. of Agriculture, Beltsville, Maryland*

Object: To study the biology and control of mosquitoes especially in coastal marsh and rice growing areas of Louisiana.

Plan of work: Marsh areas will be classified as to topography, vegetation, soil, etc., and mosquito breeding potential determined. Studies will be made of egg populations and preferred oviposition sites in relation to environment; the physiology and embryonic development of different species of eggs; and effects of single, successive, and continuous floodings on eggs of various ages. The effects on mosquito breeding will be determined under different water management procedures in relation to environmental changes, and under different soil and water management schemes. Adult mosquito abundance and seasonal trends will be measured in relation to breeding conditions. Studies will be made of migration habits of different species, in relation to age and environmental and meteorological conditions; sex attraction in different species and factors affecting adult female attraction to man and animals; isolation and development of sex attractants; parasites, predators, pathogens and other biological agents that attract mosquito larvae and methods for their mass production and distribution; and insecticides, chemosterilants, and other materials for use against mosquitoes.

SUPPORTED BY U.S. Dept. of Agriculture

2.0577, THE EFFECT OF PREDATORS AND PARASITES ON THE BREEDING POTENTIAL OF MOSQUITOES *C.H. SCHMIDT, U.S. Dept. of Agriculture, Beltsville, Maryland*

Object: To determine predators and parasites of mosquito larvae found in coastal-marsh areas of Louisiana and to study in

2. WATER CYCLE

this area their influence on the breeding potential of mosquitoes and factors affecting their role in the control of mosquito larvae.

Plan of work: In salt-, brackish-, and fresh-water areas, ditched, impounded and natural marshes will be selected for studies on predators and parasites of *Aedes sollicitans* and other marsh-breeding species of mosquitoes. The types of predators and parasites, particularly predatory fishes and aquatic insects which thrive under wide ranges of environmental conditions, which are prevalent, will be determined. For each predatory species the relative preference for feeding on mosquito larvae compared with other food items will be studied in laboratory and small-field plot environments. The effect of various factors, such as the species of aquatic plants present and their density and fluctuations in water level and salinity, on the abundance of predators and parasites, and their effectiveness in reducing mosquito populations will be determined. As opportunities present themselves in the course of field work by the contractor, he will collect marsh mosquito larvae which show signs of infection by pathogens and transmit this material to the Insects Affecting Man and Animals Research Laboratory at Lake Charles, Louisiana, for study by specialists in mosquito pathology.

SUPPORTED BY U.S. Dept. of Agriculture

2.0578, DIFFERENTIAL RESPONSE OF SORGHUMS TO DIFFERENCES IN CULTURE AND ENVIRONMENT

G.F. SPRAGUE, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To conduct basic physiological and biochemical investigations on grain sorghum to provide information about the effects of environmental factors, such as temperature, moisture, light and nutritional status on basic mechanisms of plant growth and metabolism, and ultimately, on grain yield and quality, and about other physiological phenomena.

Plan of work: Research will be conducted in the laboratory, greenhouse, growth chamber, and/or field on: (1) drought resistance, including the efficiency of water use at varying levels of moisture availability and nutrients; (2) the efficiency of light utilization at various population densities; (3) relative growth rates of different height and maturity genotypes under varying conditions of moisture stress, population and nutrient levels; and (4) the relationship of content and composition of protein in the grain to date and rate of planting, fertility level, genotypes of plant, and moisture regime.

2.0580, THE DETERMINATION OF ZONES OF INTENSE CONTRIBUTION TO STREAM FLOW AS RELATED TO THE CONCEPT OF PARTIAL AREA CONTRIBUTIONS

R.M. RAGAN, Univ. of Maryland, School of Engineering, College Park, Maryland

The proposal is to develop a simulation model of a watershed that will be capable of isolating components of the runoff cycle of the watershed for intensive investigation. Numerical investigations of data already available from a pair of well-instrumented research watersheds will be made using the IBM 7094 Digital Computer.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Maryland

2.0581, PARTIAL AREA CONTRIBUTION TO STREAM FLOW

R.M. RAGAN, Univ. of Maryland, School of Engineering, College Park, Maryland

The proposal is to develop a simulation model of a watershed that will be capable of isolating components of the runoff cycle of the watershed for intensive investigation. Numerical investigations of data already available from a pair of well-instrumented research watersheds will be made using the IBM 7094 Digital Computer. The study proposed is a continuation of work initiated under project B-003 MD in September 1968.

2.0582, SOIL - PLANT - WATER RELATIONSHIPS

C.W. REYNOLDS, Univ. of Maryland, Agricultural Experiment Sta., College Park, Maryland

Objective: 1. To determine the influence of plant and environmental variables upon water extraction from the soil profile.

Description of Work Proposed: Effects of irrigation treatments, varieties, plant populations, stages of growth, and growth retardants or water extraction patterns of selected vegetable crops will be determined. Extraction from various depths of the profile will be measured with the neutron moisture meter and related to patterns of root development of the crops.

SUPPORTED BY U.S. Dept. of Agriculture
Maryland State Government

2.0583, STUDY OF ROOT DISTRIBUTION AND DENSITY OF VEGETABLE CROPS

C.W. REYNOLDS, Univ. of Maryland, Agricultural Experiment Sta., College Park, Maryland

Objectives: 1) To delineate the pattern of root development of selected vegetable crops through the soil profile in soils of different types. 2) To measure the relationships between the density and distribution of roots of vegetable crops and the losses of water from the soil profile as measured by the neutron meter. 3) To determine the relationships between the density and distribution of roots of vegetable crops and the absorption and utilization of p32 from different zones of the soil profile.

Description of Work: Root distribution of selected vegetable crops (including snap beans, tomatoes, and sweet potatoes) will be estimated at intervals during the growing season by a) obtaining soil cores and extracting roots from the samples obtained at various locations in the soil profile, b) measuring the absorption by plants of p32 emplaced at different locations in the soil profile, and c) by determining losses of water from various layers of the profile with the neutron moisture meter. A limited number of plants will be excavated during the season to determine the extent and distribution of root systems.

Maryland State Government

2.0584, EXPERIMENTAL AND THEORETICAL STUDY OF THE HYDRODYNAMICS OF DISPERSION IN RIVERS AND ESTUARIES

M.P. TULIN, Hydronautics Incorporated, Laurel, Maryland

The general aims of the proposed research are: 1. To improve understanding of river hydraulics inasmuch as it has a bearing on dispersion. 2. To develop methods enabling the calculation of the velocity distribution in streams, which may be used to determine the dispersion coefficient, and to provide systematical experimental assessment of the results. 3. To provide experimentally verified, quantitative results relating to dispersion in channels with varying aspect ratio and boundary roughness distribution. 4. To develop quantitative verified theories relating components of the dispersion tensor to the mean flow characteristics. 5. To provide useful and verified information and procedures relating to the scaling and model testing of dispersion in streams.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

2.0585, THE EFFECT OF OCEAN WATER INTRUSION INTO BACK BAY, VIRGINIA, AND CURRITUCK SOUND, NORTH CAROLINA, ON THE WATERFOWL AND FISH HABITAT

J.L. SINCOCK, U.S. Dept. of Interior, Patuxent Wlfe. Res. Ctr., Laurel, Maryland

The initial investigation into the ecology of Back Bay, Virginia, and Currituck Sound, North Carolina, was terminated on March 7, 1962, when an Atlantic Coastal storm introduced ocean water into the fresh to slightly brackish water of the area. The second phase of the investigation is now in progress and its objectives are to determine the effects of the increased water salinity on the waterfowl and fresh water fish habitat. The methods employed are identical to the first phase of the investigation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

2.0586, MICROBIOLOGY OF MARINE AND ESTUARINE INVERTEBRATES

R.R. COLWELL, U.S. Dept. of Interior, Biological Laboratory, Oxford, Maryland

A study of the natural bacterial flora of oysters and associated invertebrate animals has been initiated. Animals from specified areas of Chesapeake Bay and off the Atlantic Coast are being sampled, using specified aseptic techniques to determine the quantitative and qualitative bacteriological flora of the animals. The normal commensal flora of oysters is being determined by examination of the shell liquor, body flesh, and intestine.

Standard bacteriological procedures are being followed for sampling, testing, and analysis. However, newer techniques of diagnosis and taxonomy will be applied, including the high-speed computer methods and the nucleic acid analyses, techniques developed and/or adapted by the Principal Investigator in previous published research.

Ancillary studies of the environment of the animals, i.e., water and mud samples, are also being undertaken. Unique features of the bacterial populations which are observed will be studied in detail.

The work is being undertaken at Georgetown University with the active collaboration of personnel at the Biological Laboratory, Bureau of Commercial Fisheries, U. S. Fish and Wildlife Service, Oxford, Maryland.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0587, FIRE WEATHER FORECAST TECHNIQUES

R.C. ELVANDER, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

To develop objective Fire Weather forecast techniques in the prediction of temperature, relative humidity, winds, precipitation, and thunderstorms over selected stations throughout the U. S.

Multiple regression and screening of surface and upper air predictors on dependent samples, and application to the National Meteorological Center prognoses in forecast operation. Techniques will be developed for both local and centralized use. An objective system of map typing will be used to stratify the data and a special study will be made of the Santa Ana winds.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0588, NUMERICAL PRECIPITATION MODEL

H.R. GLAHN, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

To develop numerical models which will predict precipitation on a scale of about 50 miles and a time scale of about 3-hours for up to 18-hours projection. Subsynoptic forecasts of this type are required by many special users, as well as general public.

Existing models will be adapted to the smaller scale in a workable manner and present computer programs will be streamlined so that latest possible data can be used.

As of July 1968 the Subsynoptic Advection Model is expected to be fully operational. Extension of the model or the development of a different model to be used in the western U.S.

will probably be desirable. This task is part of a project which will continue until June 1972.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0589, NATIONWIDE PRECIPITATION - NMC FORECAST TECHNIQUES

W.H. KLEIN, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

To improve and automate nationwide forecasts of precipitation probability, timing, and amount for public and hydrologic use.

Conditional probabilities of precipitation are computed for 108 cities. Multiple regression equations are derived for each city by the screening program. The equations are applied to NMC prognoses to forecast precipitation 12-72 hours in advance. Also, forecasts of net vertical displacement and moisture are prepared from 3 dimensional computers trajectories on a current basis and related to clouds and precipitation by synoptic, theoretical, and statistical means.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0590, IMPROVE PRECIPITATION MEASURING EQUIPMENT - PRESSURE TRANSDUCER ANALYSIS

F.V. KOHL, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

Make a study of the availability of a suitable aneroid pressure transducer to replace mercury manometer on telemetering storage precipitation gage. This will make the instrument less bulky, more rugged, and better suited for transportation and operation in remote rugged environments.

Equipment from several manufacturers will be surveyed to find out which is best suited for modification to meet the needed requirements.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0591, IMPROVE PRECIPITATION MEASURING EQUIPMENT - D-III PRECIPITATION EQUIPMENT

F.V. KOHL, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

Make a study of the adequacy of the D111 precipitation gage design and the data supplied by it, and make recommendations for improvements, particularly in the areas of registering and telemetering of data.

An analysis will be made of the users need and the mechanical and electrical characteristics of the equipment. Improvements needed in the equipment to best satisfy the users need will be highlighted.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0592, SUBSYNOPTIC WEATHER SPECIFICATION

D.A. LOWRY, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

To determine statistical relationships between actual weather variables and parameters forecast by numerical models. Requirement is for better forecasts of local weather on subsynoptic scale.

Three-hourly values of observed weather variables, including cooling, total sky cover, weather, dew point, wind, temperature and precipitation amounts, are obtained from Asheville and related to the output of numerical models developed at the National Meteorological Center and the Techniques Development Laboratory. These relationships will be used to produce forecasts for field use. The results of the Numerical Precipitation model (2121 22 216) are necessary for this task.

As of July 1, 1968 data from Asheville (NWRC) will be collected and error checked on a monthly basis and initial results will be incorporated in the operational forecast for surface wind. The task is part of a project which will continue until June 1973.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0593, METEOROLOGICAL DROUGHT

W.C. PALMER, U.S. Dept. of Commerce, Lab. For Environ. Data Res., Silver Spring, Maryland 20910

A continuing study to develop techniques to evaluate drought probabilities, to compare severities, and to develop means of computing current conditions. In the advanced phases of the project, drought criteria for specific purposes will be attempted, for example, with respect to growing plants.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0594, PROBABLE MAXIMUM PRECIPITATION FOR SMALL BASIN IN THE TENNESSEE RIVER DRAINAGE SYSTEM

J.L. PAULHUS, U.S. Dept. of Commerce, Off. of Hydrology, Silver Spring, Maryland 20910

Objectives are to provide generalized estimates of probable maximum precipitation and standard project storm rainfall for basins ranging from 5 to 3000 sq. mi. The estimates are to be presented on maps on which topographic influences will be reflected in much greater detail than in previous work.

SUPPORTED BY U.S. Tennessee Valley Auth.
U.S. Dept. of Commerce - E.S.S.A.

2.0595, TROPICAL STORM RAINFALL AND HURRICANE WIND FIELDS

J.L. PAULHUS, U.S. Dept. of Commerce, Off. of Hydrology, Silver Spring, Maryland 20910

Two separate investigations are included in this research. One study attempts to specify in detail the frequency and spatial distribution of 6- and 12-hour tropical storm rainfall for the period from 24 hours before to 24 hours after landfall for storms entering the United States coastline between Apalachicola, Florida, and Brownsville, Texas. The other investigation aims to define the surface wind field and other parameters of standardized and probable maximum hurricanes for any location along the Gulf or Atlantic Coasts of the United States. The other parameters are: lowest central pressure, maximum wind speed, radius of belt of maximum winds, and rate of storm movement. Investigations were initiated in fiscal year 1967 and will be completed in fiscal year 1969.

SUPPORTED BY U.S. Dept. of Defense - Army
U.S. Dept. of Commerce - E.S.S.A.

2.0596, EXTREME RAINFALL FOR THE MEKONG RIVER BASIN

J.L. PAULHUS, U.S. Dept. of Commerce, Off. of Hydrology, Silver Spring, Maryland 20910

Objectives are to develop precipitation criteria required for comprehensive planning for water management purposes, such as flood control, hydroelectric power, and irrigation. Of primary interest are rainfall data for developing maximum flows on the main stem of the Mekong above three proposed dam sites controlling drainage from areas from 105,000 to 250,000 sq. mi. This involves rainfall for periods up to five months in the monsoon season, May-September. Also required are estimates of probable maximum precipitation for durations up to 72 hours and areas from 2,000 to 10,000 sq. mi. to be used in tributary water management planning and design. Project was begun in fiscal year 1968 and is scheduled for completion in fiscal year 1969.

SUPPORTED BY U.S. Dept. of Defense - Army
U.S. Dept. of Commerce - E.S.S.A.

2.0597, PROBABLE MAXIMUM PRECIPITATION FOR SOUTHWEST STATES

J.L. PAULHUS, U.S. Dept. of Commerce, Off. of Hydrology, Silver Spring, Maryland 20910

Objectives are to provide generalized estimates of probable maximum precipitation for durations up to 72 hours and areas up to 5000 sq. mi. and its seasonal variation from fall through spring

for determining combined rainfall and snowmelt spillway design floods. Generalized estimates of probable maximum summer thunderstorm rainfall will be developed for small areas. The study area includes Nevada, Utah, Arizona, New Mexico and the interior drainage of California. Investigation was begun in fiscal year 1967 and is scheduled for completion in fiscal year 1970.

SUPPORTED BY U.S. Dept. of Defense - Army
U.S. Dept. of Commerce - E.S.S.A.

2.0598, PROBABLE MAXIMUM PRECIPITATION FOR THE LOWER RIO GRANDE

J.L. PAULHUS, U.S. Dept. of Commerce, Off. of Hydrology, Silver Spring, Maryland 20910

Estimates of probable maximum precipitation for durations up to 96 hours are being made for five basins ranging in size from 1,700 to 18,000 sq. mi. Three of the basins are on the Rio San Juan and Rio Alamo, entirely in Mexico. In addition, the 50- and 100-year 1- to 3-day basin rainfalls are being determined. Project was begun in fiscal year 1968 and will be completed early in fiscal year 1969.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0599, MARINE SURFACE FORECASTING TECHNIQUES

N.A. PORE, U.S. Dept. of Commerce, Weather Bureau, Silver Spring, Maryland 20910

To develop objective techniques to improve forecasting of storm surges; i.e., changes in water level due to atmospheric disturbances. The approach is of a physical - statistical nature. The relationship of extratropical storm surges along the East Coast to off-shore wind circulation will be determined. A similar relation will be derived for the wind set-up on Lake Erie.

As of July 1, 1968, data on observed tide, astronomical tide, and storm surge will be compiled for eight (8) stations on the U.S. East Coast, beginning with 1955, and prediction equations for Lake Erie set-up will be tested. This task is part of a project which will continue until June 1973.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0600, HYDROLOGIC MODEL FOR STREAMFLOW FORECASTING

A.K. SHOWALTER, U.S. Dept. of Commerce, Off. of Hydrology, Silver Spring, Maryland 20910

The objective of this research is to develop a conceptual hydrologic model that will provide continuous simulation of the streamflow hydrograph. A successful model would provide increased accuracy in prediction of flood peaks, inflow to water control reservoirs and low flows (for water pollution control). The model is based on an evaluation and individual treatment of the several components of total runoff and provides the synthesis of the continuous streamflow hydrograph directly from precipitation and selected meteorological factors. Several models are being tested, including well known Stanford Watershed Model, on several watersheds in the United States representing a wide variety of hydrologic regimes.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0601, PRECIPITATION

A.K. SHOWALTER, U.S. Dept. of Commerce, Environ. Sci. Serv. Admin., Silver Spring, Maryland 20910

Precipitation studies consist of the following: (1) In cooperation with the Agricultural Research Service at their Sleepers River Research Watershed, sets of 5 recording precipitation gages are being installed at three sites with significantly different exposure characteristics. These installations include a gage installed at ground level to provide 'ground truth' rainfall. At one site, 'ground truth' water equivalent of snowfall will be obtained by a twin-probe snow density gage. Data from these and other locations will be analyzed to test the validity of various techniques for estimating 'ground truth' precipitation from standard observations.

2. WATER CYCLE

(2) Precipitation and selected meteorological data are being collected from a line of stations traversing the Wasatch Front near Salt Lake City, Utah. These data will be used with upper air meteorological information to develop methods for determining the distribution of precipitation in mountainous areas. Such information is needed for short-and long-term streamflow forecasting.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0602, SNOW METAMORPHOSIS AND SNOWMELT
A.K. SHOWALTER, U.S. Dept. of Commerce, Environ. Sci. Serv. Admin., Silver Spring, Maryland 20910

A research project on snow metamorphosis and snowmelt has been established in cooperation with the Agricultural Research Service at their Sleepers River Research Watershed at Danville, Vt. All aspects of snow metamorphosis will be studied to provide the basis for developing improved techniques for estimating rate of snowmelt from meteorological factors. Another objective is to develop better instrumentation for measuring the water equivalent of the snow pack to provide reliable values of daily change. Efforts are also devoted to developing an inexpensive instrument or method for determining the albedo of the snow. More reliable estimates of daily increments of snowmelt would provide improved operational river forecasts prepared and issued by the Weather Bureau.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0603, EVAPORATION
A.K. SHOWALTER, U.S. Dept. of Commerce, Environ. Sci. Serv. Admin., Silver Spring, Maryland 20910

Research continues on development of improved methods for estimating free-water evaporation. Current evaporation studies consist of the following: (1) At the request of the Working Group on Evaporation of the World Meteorological Organization, evaporation comparisons are being made of the Class A and Soviet GGI-3000 pans to assist in the selection of an interim international reference evaporimeter. These comparisons are being made at evaporation installations located at Sterling, Va., Lake Mead, Ariz.-Nev., and Davis, Calif. (2) A new insulated evaporation pan has been developed and is being tested at sites noted above. It is hoped that this pan will prove superior to existing pans. This insulated pan will also provide values of incident minus reflected all-wave radiation. (3) Analysis of evaporation data from a network of 13 Class A stations located in U. S. Forest Service Davis County Experimental Watershed near Farmington, Utah at elevations ranging from 4,000 to 9,000 m.s.l. is underway. The objective is to evaluate the effect of elevation and exposure on rate of evaporation. (4) In cooperation with the Geological Survey, a study is being made at Salton Sea of the effect of lake size on evaporation. (5) Continued efforts are devoted to development of improved techniques for computing free-water evaporation from meteorological factors.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0604, PROBABILITY TABLES FOR PRECIPITATION
H.C. THOM, U.S. Dept. of Commerce, Environ. Data Serv., Silver Spring, Maryland 20910

Probability tables and method for fitting distribution to precipitation. A new method is being developed for inverting the gamma distribution making possible inverse as well as direct tables which are also being computed.

Develop an index of plant-water requirement and its probability of occurrence. Precipitation and soil moisture will be treated jointly.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0605, SCALE OF PRECIPITATION
H.C. THOM, U.S. Dept. of Commerce, Environ. Sci. Serv. Admin., Silver Spring, Maryland 20910

Investigation of the scale property of the precipitation variable in relation to meteorological conditions. This should be useful in the investigation of the artificial augmentation of precipitation.

Precipitation network design improvements are being developed in the light of current studies of the variability of precipitation with time and space.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0606, MISCELLANEOUS FIELD RESEARCH IN CLIMATOLOGY
UNKNOWN, U.S. Dept. of Commerce, Environ. Data Serv., Silver Spring, Maryland 20910

In general, the 48 professional Climatologists located throughout the United States devote about 50% of their time to work which is other than operational--about half of this or 25% can be classed as research. Individual projects vary greatly depending upon local requirements as well as the individual backgrounds and interests of the Climatologists concerned.

Many of them are pursuing projects associated with water availability: Alaska - National associated assessment of Water and Related Land Resources. Illinois - Snow Climatology, Glaze and Ice Storms. Missouri - Weather Modification; evaluation of effects. Wyoming - Precipitation in the Upper North Platte Valley. Oregon - Climatological Handbook, 'Columbia Basin States'. Oklahoma - A comprehensive Plan for Development of Water and Related Land Resources. Washington - Climatological Handbook, Columbia Basin States. Michigan - Precipitation Probabilities and snowfall statistics for Michigan. Southern New England - Topographic precipitation relationships. Northern New England - Study of snowfall and snow cover. New Jersey - Snowfall and snow depth studies. Virginia - Monthly Precipitation Probabilities. Florida - The Climate of the St. Johns River Basin. Maryland - Delaware - Studies of snow frequency, and tropical storms. Kentucky - Precipitation and soil moisture. Louisiana - Tropical storm and hurricane precipitation. Montana - Trends in glacier formation and extension. Ohio - Precipitation probability. Utah - Precipitation altitude relationships. West Virginia - Precipitation probabilities.

2.0607, THE ECOLOGY OF THE YOUNG FISHES OF THE WEWEANTIC RIVER ESTUARY
C.F. COLE, Univ. of Massachusetts, School of Agriculture, Amherst, Massachusetts 01003

The 7.5 km. long Weweantic River estuary (upper Buzzards Bay, Massachusetts) is being sampled weekly at seven stations for surface and bottom plankton as well as salinity and temperature data. Additionally, otter trawling, beach seining and gill and fyke netting are being conducted as necessary. Data for a year's study of the reproductive life history and early growth of the tomcod (*Microgadus tomcod*) have been gathered and are being analyzed by Arnold Howe for his master's thesis. The biology of the American smelt (*Osmerus mordax*) in the Weweantic is also being studied by David Crestin for his master's thesis. Roderick Smith, supported in part by this grant and also by an FWPCA grant is studying the effects of pesticides on winter flounder reproduction in this river. Robert Lebida has completed a thesis on the seasonality of fishes in the Weweantic during 1966. A continuing study on the seasonality of fish eggs and larvae in the Weweantic has been underway since December 1965 and upon termination of this study program in 1969 will have an insight into year-to-year variation in this estuary's fish population and some idea of the effects of the environment on larval fishes. As a phase of this program, we are also attempting to devise a system for estimating mortality rates of larval flounder for comparison between polluted and unpolluted estuaries in Massachusetts.

2.0699, THE ROLE OF AQUATIC VASCULAR PLANTS IN THE EUTROPHICATION OF SELECTED LAKES IN WESTERN MASSACHUSETTS

R.B. LIVINGSTON, Univ. of Massachusetts, Graduate School, Amherst, Massachusetts 01003

The proposed study will utilize SCUBA gear to obtain quantitative measurements on the productivity (standing crop) of the aquatic vascular plants in oligotrophic and eutrophic lakes in western Massachusetts. The field collections will also add to the record of the aquatic flora of western Massachusetts.

The distribution and abundance of these plants will be correlated with the geological and limnological conditions (pH, temperature, dissolved oxygen, total alkalinity, conductivity and light intensity). The sampling will be carried out in four lakes at monthly (hopefully bi-weekly) intervals.

The seasonal growth of the plants and the nutrient content of their tissues (total nitrogen and phosphorus) will be correlated with the limnological data and particularly the nutrient supplies available in the water and the substrate. This should reveal the presence of any accumulators or indicators of trophic conditions.

Laboratory studies are being carried out on the significance of nutrient absorption by the roots in the metabolism of the aquatic vascular plant.

University of Massachusetts

2.0610, DETERMINATION OF THE FEASIBILITY OF REMOVAL OF ALGAL NUTRIENTS IN LAKE WATERS BY ION-EXCHANGE

O.T. ZAJICEK, Univ. of Massachusetts, Graduate School, Amherst, Massachusetts 01003

The objective of this project is to develop a simple and (relatively) inexpensive technique for the 'in situ' removal of phosphate from natural waters by an ion exchange process. To this end, the behavior of various ion exchangers will be studied for exchange characteristics and selectivity for phosphate species as a function of pH, counter ions, temperature, and flow rate. In addition, attempts will be made to prepare phosphate specific ion exchangers. The information acquired will be used to develop a device and optimum conditions for the removal of phosphates from natural waters.

Massachusetts State Government

2.0613, GROUND WATER CONDITIONS OF THE CENTRAL BOSTON AREA, MASSACHUSETTS

J.E. COTTON, U.S. Dept. of Interior, Water Resources Division, Boston, Massachusetts

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Massachusetts.

Purpose: To describe the configuration of the water table, record any fluctuations related to major excavations, and determine the hydrologic character of the unconsolidated deposits.

Methods: Existing and procured water-level and subsurface records will be analyzed. Observation wells will be established. Aquifer materials will be sampled for laboratory analysis to determine the hydrologic character of the materials (permeability, grain size, specific yield, etc.). Maps with the contours illustrating bedrock surface, water table, and saturated thickness will be prepared. A material distribution map will be prepared.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Massachusetts State Government

2.0614, WATER RESOURCES OF BRANCH-BLACKSTONE RIVER BASIN, RHODE ISLAND

J.B. GONTHIER, U.S. Dept. of Interior, Water Resources Division, Boston, Massachusetts

This research is part of the program of water resources investigations conducted by the U.S. Geological Survey in cooperation with the State of Rhode Island.

Purpose: To obtain water resources information which will aid planners of facilities for future water needs of Rhode Island.

Methods: The principal emphasis will be on the evaluation of the practical sustained yield of the subsurface reservoirs in the area.

Data from the 4 existing stream-gaging stations in the basin will be analyzed and additional low-flow measurements will be made in order to evaluate the ground-water runoff in all parts of the basin. Surface-water runoff and recharge will be determined in topographically and geologically dissimilar environments. Aquifer transmissibility will be computed from existing data and from materials analyses from proposed drilling. Sediment and water-quality samples will be collected and evaluated.

2.0615, ANALYSIS AND SYNTHESIS OF HYDROLOGIC SYSTEMS

P.S. EAGLESON, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

Development of improved analytical techniques for the prediction of the time variable in stream flow at some point in a drainage basin due to a given temporal and areal distribution precipitation. Development of the means for synthesizing these predictors in the absence of long term hydrologic records. The laboratory rainmaker is being used in conjunction with a computer simulation of overland flow to study the errors accompanying the unavoidable lack of dynamic similarity in using scale models of surface runoff. The equipment is also being used in the development and evaluation of analytical methods for separating the surface and groundwater components in streamflow.

2.0616, THERMAL STRATIFICATION IN RESERVOIRS

D.R. HARLEMAN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

Determination of analytical methods of predicting the transient temperature distribution in a reservoir having inflow and outflow. Study includes determination of flow through time in reservoir as well as the time variation of the outlet water temperature. The two dimensional heat transfer equation has been simplified by making assumptions regarding internal velocities and temperature gradients. The resulting differential equation in-

2. WATER CYCLE

cludes the temperature variation of the inflowing river, solar radiation input, heat losses from the reservoir surface, and outlet flow rate. The equation is solved by means of an implicit finite difference scheme on a digital computer. Experiments have been conducted on a 40 ft. laboratory reservoir model in which solar radiation is simulated by infra-red heat lamps. Internal temperature distributions and outlet water temperature are compared with predicted values.

2.0617, TECHNIQUES OF MODELING THERMAL STRATIFICATION IN LAKES

D.R. HARLEMAN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

A theory for the vertical temperature distribution has been developed. The theory predicts the development of a surface mixed layer of varying temperature and depth. The results are applicable to deep lakes or shallow ponds in which various bottom thermal boundary conditions may be assumed. Experiments were conducted to verify the theory in a laboratory tank using insolation supplied by mercury vapor and infra-red lamps. The experiments indicate that thermal stratification may be reproduced in the laboratory for the study of wind induced circulation or mechanical de-stratification by pumping. Current investigations are concerned with evaporative heat losses in laboratory tanks.

2.0618, TIDAL, SALINITY AND SEDIMENTATION PROBLEMS IN LAKE MARACAIBO CHANNEL, VENEZUELA

A.T. IPPEN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

Purpose of basic research: Investigation of flow variables and soil properties controlling rates of erosion and deposition of fine cohesive sediment in a flow field. Purpose of field investigation: To determine the sources and motion of sediment and the time and spacial salinity distribution within the Maracaibo estuary in Venezuela, and to utilize this information for designing remedial works in order to reduce shoaling in the Maracaibo Navigable Channel and control salt water intrusion into Lake Maracaibo. Basic research: The special apparatus developed consists of an annular rotating channel and a counterrotating annular ring placed in the channel and in contact with the water surface. The relative motion of channel and ring generates a uniform turbulent flow field. Experiments with kaolinite clay suspensions have revealed two important properties: (1) The existence of a critical flow velocity for clay deposition. (2) For a given flow, the equilibrium concentration is a constant percentage of the initial sediment concentration in the channel. Field investigations: Results point out that most of the sediment comes from the Gulf of Venezuela transported near the bottom by tidal and salinity currents. Also a bottom layer at high salinity has been found to exist all the way to the entrance to the Lake throughout the year.

2.0619, RESEARCH IN OCEANIC PHYSICS

H.M. STOMMEL, Mass. Inst. of Technology, Graduate School, Cambridge, Massachusetts 02139

The program centers about a field study of the small scale structures and mixing processes within the main thermocline of the subtropical Atlantic ocean. Various new forms of instrumentation will be used to measure shear, density stability, and life history of laminae on vertical scales of less than ten meters. The field study is scheduled for the Research Vessel ATLANTIS II on August 28 - September 19, 1968, southeast of Bermuda.

Theoretical study of the Ekman layer in the presence of strong heating and application to the Trade wind region of the ocean is contemplated. Also a laboratory model-study and theoretical study of density tongues in rotating density-stratified

fluids is being pursued: with the hope of eventual application to interpretation of the spreading of water-masses at depth.

During the Spring of 1969 an attempt will be made to locate, identify, and intensively survey a region of active bottom -water formation in the Ligurian Sea. A continuous monitoring of the cold- upwelling region off Somalia, associated with the Monsoon induced Somali Current is also in progress in the hope of providing definite information on the time of response of an ocean current to variable wind-stress. The latter investigations are meant to be part of the U.S.-Italy Cooperative Science Program.

2.0620, THE ECOLOGY OF SELECTED SUBMERSED AQUATIC WEEDS

R.M. DEVLIN, Univ. of Massachusetts, Agricultural Experiment Sta., East Wareham, Massachusetts 02538

1. To study the growth and development of *Myriophyllum*, *Potamogeton*, *Elodea* and *Najas* as affected by: a. Chemical variables - such as nutrients and other dissolved solids, pH, and dissolved gases. b. Physical variables - such as light, temperature, water depth and flow and turbidity. c. Biological variables - including competition, predation and stimulation.

2. To relate the results obtained to the incidence, distribution, management and control of the above-mentioned genera.

The Massachusetts Agricultural Experiment Station will study the physical, chemical, and biological variables affecting the growth and development of *Myriophyllum*, *Potamogeton*, and *Algae*.

2.0621, GEOMORPHOLOGY OF LOW-ORDER STREAMS

J. VILETTO, U.S. Army, Natick Laboratories, Natick, Massachusetts

Technical Objective - To study the geomorphology of low order streams in order to develop terrain design criteria. To test the accuracy and validity of relations between selected stream parameters /numbers, length, density, gradients, confluence angles, channel cross sections and channel bank material/ of low-order drainage systems. Better information on the number and physical characteristics of streams in selected basins will be useful in providing data for terrain design conditions.

Approach - Four low-order basins were selected in a twenty square mile area. By limiting the study to a small area, several factors remain essentially constant, thereby decreasing the complexity of the problem. Field measuring of the parameters and mapping is necessary because published maps, including the 1967 U.S. Geological survey topographic quadrangles of the study area seldom show streams lower than third order.

Progress - /Jul 67 - Aug 68/ - Library research and field work are complete, profiles were measured, and data analyzed from field notes. These data have been found to be directly applicable to the development of terrain design criteria. Data on stream numbers and lengths, and confluence angles have been analyzed and found to differ from theoretical values by twenty to fifty percent in several instances. A modified method for computing the number of streams has decreased the error by about 50 percent. A report summarizing this work has been prepared.

2.0622, ENERGY SOURCES OF HETEROTROPHIC MICROORGANISMS IN AN AQUATIC ENVIRONMENT

R.T. WRIGHT, Gordon College, Undergraduate School, Wenham, Massachusetts 01984

Previous work by the investigator has helped point to methods leading to an understanding of the trophic relationships between the planktonic algae, bacteria and dissolved organic matter. More recent applications of the methods have dealt with glycolic acid and indicate that bacteria in natural waters are using this important algal excretory product for energy. Continued research along these lines may lead to a basic understanding of how most of the planktonic bacteria obtain energy and influence

2. WATER CYCLE

the concentrations and array of organic compounds in aquatic systems. The proposed lines of continuing investigation are: 1. Identification and production rates of the dissolved organic compounds lost by algae during photosynthesis. 2. Measurement of the rates at which certain important dissolved organic compounds lost by algae are assimilated by populations of heterotrophic microorganisms in natural waters. 3. Laboratory and field studies aimed at discovering the roles of different species of microorganisms involved in the uptake and transformation of specific organic compounds under natural conditions.

SUPPORTED BY U.S. National Science Foundation

2.0623, MARINE HYDROLOGY AND GEOCHEMISTRY, ATLANTIC CONTINENTAL SHELF AND SLOPE

R.H. MEADE, U.S. Dept. of Interior, Water Resources Division, Woods Hole, Massachusetts

Objectives: (1) To determine the rates and loci of fresh water (both surface and ground waters) and salt water along the Atlantic Coast, and to understand the influences of different factors on mixing processes. (2) To determine the chemical compositions of surficial sediments and older sedimentary rocks of the Atlantic Continental Shelf and Slope -- including the composition of their interstitial waters - and to understand their areal and stratigraphic variations. (3) To determine the amount of suspended matter and to understand the dispersal of sediments in coastal waters.

Approaches: (1) Information on salinity (the main index of mixing of fresh and salt waters) and its variations in coastal waters is being compiled in atlas form, largely from existing data. (2) Chemical analyses (major and selected minor elements) are being made of surficial bottom sediments from the continental shelf and slope, and of rocks and interstitial waters that lie below the shelf and slope. Concentrations of suspended matter have been measured gravimetrically, and suspended constituents have been identified microscopically.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0624, CIRCULATION ON THE CONTINENTAL SHELF

D.F. BUMPUS, Woods Hole Oceanographic Inst., Woods Hole, Massachusetts 02543

This investigator has endeavored to delineate the horizontal motions in the circulatory system of the continental shelf of the east coast of the United States. With the generalized pattern in hand we are trying to work out the secular changes in the circulation and their causes. We will use a Lagrangian technique with drift bottles at the surface and sea-bed drifters at the bottom and make use of all the physical oceanographic, hydrological, climatic and meteorological data and theory to elucidate these motions.

2.0625, CHEMISTRY OF THE HYPOLIMNION OF LAKE ERIE

H.E. ALLEN, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

During the period of summer stratification much of the hypolimnion in Lake Erie experiences severe oxygen depletion. Concurrent large changes occur in the concentration of nitrate, ammonia, phosphate, iron, manganese, and sulfide. Our objectives include describing the magnitude and rate of these changes, determining the chemical compounds involved and determining the effects of these changes on the ecosystem. Subsequent to fall overturn concentrations of these materials return to those concentrations existing prior to stratification. Field studies are being made to determine the concentrations of these and other substances in the waters. Laboratory studies are being conducted to determine the oxidation-reduction potential at which materials are released from the sediments and to determine the kinetics of their buildup in the water. The chemical composition of materials precipitated upon overturn is being investigated. Various sediments are being investigated to determine the substances responsible for oxygen depletion.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0626, ECOLOGY OF GREAT LAKES ESTUARIES

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

The various bays are among the most productive environments of the Great Lakes and they are also the most vulnerable to human activities. Industrial and domestic wastes impair the fertility of the water as well as the edibility of the fish. The immediate objectives of this project are to determine to what extent oceanographic methods can be applied to studies of these bays. Subsequent work will be concerned with the movements and influence on the biota of waters flowing into these areas. Thermal, light transmission, chemical, surface current, sediment, plankton, and benthos data have been collected from Saginaw Bay, Lake Huron. Flushing-rate estimates, using oceanographic methods, have been made for Saginaw Bay. Drogue studies have been made in northern Green Bay, Lake Michigan.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0627, OXYGEN DEMAND OF LAKE ERIE SEDIMENT

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Quantitative measurements of the oxygen demand of Lake Erie sediment are being made using Warburg respirometers. Studies are being made on the effects of temperature and age of the sediments on the oxygen demand.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0628, QUANTITATIVE AND QUALITATIVE CHARACTERISTICS OF MATERIALS CONTRIBUTING TO SEDIMENTATION IN LAKE ERIE

J.F. CARR, U.S. Dept. of Interior, Biological Laboratory, Ann Arbor, Michigan

Collecting devices are being used to obtain materials as they settle from the water column but before reaching the bottom. Measurements are made of the percentage of the various components (plankton, clay, detritus, etc.) making up the sediments. In addition, measurements are made of sedimentation rate, oxygen demand, percent organic matter, nutrient content, and (hopefully) geographic origin of the material.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.0629, WAVE FORCES ON SUBMERGED STRUCTURES

E.F. BRATER, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

This research will investigate the vertical and horizontal forces on submerged structures resulting from oscillatory waves. Particular attention will be given to conduits located near or on the bottom or in a shallow trench. Analytical treatment of the inertial drag and lift forces will be supplemented by experimental determination of appropriate coefficients. The results of the studies will be applicable to the design of water intakes, sewer outlets, and other off-shore coastal structures.

SUPPORTED BY U.S. National Science Foundation

2.0630, GEOLOGICAL STUDIES IN NORTHERN LAKE MICHIGAN

J.L. HOUGH, Univ. of Michigan, Graduate School, Ann Arbor, Michigan

Northern Lake Michigan is the locale of several unsolved problems pertinent to the bedrock geology of the region and to the postglacial history of the lake. Most of the existing geological knowledge of the area stems from land-based exploration and drilling; most of the critical areas are offshore and, prior to the existence of properly equipped research vessels, could not be examined. Suitable research ships are now available and, aided by underwater photography, television and Scuba diving, offer promise of solution of hitherto insoluble problems.

2. WATER CYCLE

Two aspects of postglacial geology to which this research may make new contributions are (1) the altitudes and areal extent of submerged shorelines of old lake stages, in the area which has undergone postglacial upwarp, and (2) the depth and nature of sedimentary deposits now occupying depressions in the lake basin left at the recession of the last glaciation. Previous work in the southern and central parts of the lake, which have not undergone upwarp indicates that submerged shorelines can be traced and that seismic profiles and long core samples yield useful information of postglacial events.

2.0631, WINTER TEMPERATURE STRUCTURE OF THE GREAT LAKES

V.E. NOBLE, Univ. of Michigan, Institute of Sci. & Technology, Ann Arbor, Michigan

The program outlined in this proposal is a two-year continuation of work began under NSF grant GP-2411. During the period of the original grant, investigation of the winter temperature structure of Lake Michigan revealed strong indications of newly discovered mechanisms involved in the winter circulation patterns of the lake, and of new approaches to the prediction of the annual amount of ice cover based upon the thermal budget of the lake. The present proposal will provide additional statistical data necessary to establish confidence limits for the prediction capabilities developed under the original grant. Because of the slow accumulation of required data, two years are requested for the proposed program.

SUPPORTED BY U.S. National Science Foundation

2.0632, VERTICAL CURRENT STRUCTURE IN THE GREAT LAKES

V.E. NOBLE, Univ. of Michigan, Great Lakes Research Division, Ann Arbor, Michigan

Experimental data from Great Lakes Research Division ship-board measurements and the FWPCA GLIRBP buoy systems are being used to evaluate theoretical models for the prediction of the three-dimensional current structure in the Great Lakes. Particular emphasis is being placed on the interpretation of current meter data in order to study the dynamic interaction between geostrophic and wind-driven currents.

2.0634, TRANSIENT FLOW THROUGH CLOSED CONDUITS

V.L. STREETER, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

This research will be concerned with problems of fluid transients. The studies will provide basic information essential to some of the following problems: 1. Series-pump failures; also transients caused by pump startup. 2. Optimum valving and arrangement of pumping stations for long pipelines (with respect to hydraulic transients). 3. Resonance in systems caused by self excited means, such as leaky seals, fluttering air valves, pump or turbine vanes, governor instability. 4. Resonance in systems caused by external forced excitation, such as reciprocating pumps, arbitrary periodic valve motion, or surface waves on reservoirs; computer analysis of methods for alleviating the resonance. 5. Extension of valve stroking concepts to complex systems. 6. General study of equivalent lengths in water hammer analysis of complex piping systems, taking wave speeds into account. 7. Study of interpolation errors in characteristic method. 8. Study of gas coming out of solution during the water hammer cycle; its damping effect on pressure. 9. Study of wave speed from the characteristic equations and comparison with impedance methods. 10. Design construction and test of a valve that will produce a predetermined rate of closure; by cam drive, profiled seat, or other method.

SUPPORTED BY U.S. National Science Foundation

2.0635, PREDICTION OF THE MAGNITUDES AND FREQUENCIES OF FLOODS IN MICHIGAN

UNKNOWN, Univ. of Michigan, Graduate School, Ann Arbor, Michigan

Objective: Determination of the influence of various rainfall and drainage basin characteristics on the volume and distribution of flood runoff. The specific practical result will be the development of more accurate methods of predicting floods of various frequencies for watersheds of all sizes for selected regions in Michigan.

2.0636, GREAT LAKES RESEARCH - RIVER ICE JAMS

S.J. BOLSENGA, U.S. Army, Lake Survey, Detroit, Michigan 48226

The causes of ice jams in rivers and methods of possible elimination of destructive jams or reduction of their power are being studied.

In the first step of the study pertinent manuscripts from all areas of the world have been collected, examined, and summarized. Foreign language manuscripts account for a significant portion of the items and were translated as required. Report acquisition was through standard library sources, translation agencies, and by direct contact with investigators in the field.

The final results of the survey will be a narrative summary and selected bibliography prepared from the reports. Completion will be in June 1968.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0637, GREAT LAKES RESEARCH - LAKE EVAPORATION

J.A. DERECKI, U.S. Army, Lake Survey, Detroit, Michigan 48226

Objective is to determine the evaporation from the Great Lakes and the factors causing variation in evaporation rates. Two thirds of water supplied by precipitation over lake and land areas is being lost by evaporation; this has large effect on the availability of water in lakes, water quality and on heat budget of the lakes.

A research station located on South Manitou Island in Lake Michigan is operated to provide continuous recording of wind speed direction, precipitation, air and water temperature, humidity, barometric pressure, incoming and outgoing radiation, cloud cover, evaporation (pan), lake level, and ice cover. Field operations started December 1963 and are scheduled for completion October 1968. Data reduction is in progress.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0638, GREAT LAKES RESEARCH - LAKE PRECIPITATION

J.A. DERECKI, U.S. Army, Lake Survey, Detroit, Michigan 48226

Purpose is to determine the precipitation over the large water areas of the Great Lakes and to derive methods to calculate the overwater precipitation from the overland records.

In cooperation with U. S. Weather Bureau, the lake precipitation is being recorded on selected small islands. In Lake Michigan precipitation recording started October 1963 on South Manitou, North Manitou, South Fox, Beaver and Ile aux Gallets Islands. In Lake Erie precipitation recorders were placed on West Sister and East Sister islands during May 1964. Field program will continue through October 1968. Hourly precipitation data are available in tables and on punch cards.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Defense - Army

2.0639, GREAT LAKES RESEARCH - ENERGY TRANSFER AT THE AIR-WATER INTERFACE

J.G. HOUSLEY, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

The direct contact between water and air at their interface produces an exchange of energy and mass. Analysis of the interface activity will establish the mechanism by which energy and mass transfers, both air to water and water to air, are accomplished. These transfers are in the form of heat energy, such as radiation, conduction, convection, condensation, and evaporation; kinetic energy as in wind tides and waves; mass as in absorption of gases and solids by water; and electric charge transfer. Results will lead to improved methods of predicting waves, currents, wind tides, water supply, and modification of regional climate by the lakes.

Under contract with the University of Michigan, data are being obtained at an instrumented tower about one mile offshore, near Muskegon in Lake Michigan. The tower was in operation for the seasons 1963, 1964, and 1965, and 1967. Reduction and analysis of the data will continue in FY 69; the instrumented tower was reestablished in May 1968. Development of equipment for wind-stress measurements on a continuous basis is underway.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0640, GREAT LAKES RESEARCH - WATER-LEVEL DISTURBANCES

J.G. HOUSLEY, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

Water-level disturbances are caused by various forces, including astronomical tides, wind tides, surges, and seiches. Research investigates the formation of these water-level disturbances, their patterns and distribution over the lakes, and their effects on water levels in harbors and in rivers. The derived mathematical models of water motion and its relationship with causative forces are used to develop methods of forecasting dangerous long-period waves and currents, and changes in depths and quantities of water.

A set of 16 water-level recorders was in operation on Lake Michigan in 1964. The data have been reduced, and spectral analysis is in progress. Data from 22 water-level gages in Lake Erie will be used to investigate three-dimensional oscillations of Lake Erie in FY 69.

A contract for theoretical investigation of three-dimensional seiches in Lake Erie is in progress.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0641, GREAT LAKES RESEARCH - LAKE WAVES

J.G. HOUSLEY, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

The generation, propagation, and decay of waves in the Great Lakes are being investigated and correlated with wind speed and resulting wind stress, wind direction, and lake geometry. The characteristics of waves, including the expected maximum height given locations, will be established; wave climate charts will be prepared; and wave hindcasting methods developed.

Deep-water wave characteristics are being measured at five locations: Eagle Harbor and Whitefish Point on Lake Superior, Point Betsie and Muskegon on Lake Michigan, and Dunkirk on Lake Erie. This program was started in 1964 and will continue through 1971, with subsequent analysis of data.

In FY 69, shallow-water wave characteristics will also be measured at Knife River Harbor, Lake Superior, and Lorain, Lake Erie.

Techniques for wave hindcasting are being developed under contract with the University of Michigan. A report 'Wave Hindcasts vs Recorded Waves' by S. J. Jacobs was published in June 1965; 'Wave Hindcasts vs Recorded Waves Supplement No. 1' by A. L. Cole was published in May 1967. A second contract to

apply the developed techniques to the hindcast of waves for Lakes Superior and Huron is in progress.

A contract to develop a sonic wave sensor will be undertaken.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0642, GREAT LAKES RESEARCH - HARBOR CURRENTS

J.G. HOUSLEY, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

Objective is to acquire data on winds, currents, waves, water-level fluctuations, atmospheric pressure variations, and lake currents in the vicinity of harbors in order to determine their effect on currents in harbors, and pollution hazards engendered by the lack of currents. Mathematical equations or models will be derived relating currents in harbors with their causative forces and harbor geometry. Flushing rates will be established. The results are applicable to the design or redesign of new and existing harbors, including approach channels.

Currents were measured: 1964 in Calumet, Racine, Muskegon, and Sturgeon Bay harbors; 1965 in Little Lake, Fairport, and Buffalo harbors; and 1966 in Harbor Beach and Toledo harbors. Data and analysis of currents and associated variables in Little Lake Harbor, Lake Superior, was published in 1966. During FY 69 analysis of the data will be continued, and preparation of reports for the various harbors will be continued.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0643, GREAT LAKES RESEARCH - GREAT LAKES DE-ICING

E.W. MARSHALL, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

This investigation will prepare three reports (1) Annotated bibliography based on the world's literature on the natural conditions of the formation and decay of fresh-water ice on lakes, harbors, rivers and locks as well as scientific and engineering information on techniques used to aid the delay of ice formation and to accelerate the ice both in fresh and marine environments. (2) A summary of the pertinent papers identified in the above and (3) a summary of information developed by the in-house projects of the Research Center on Great Lakes ice characteristics and areal distribution.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0644, GREAT LAKES RESEARCH - ICE CHARACTERISTICS

E.W. MARSHALL, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

The investigation seeks to determine the physical characteristics of ice cover in the Great Lakes by field measurements and laboratory analysis of samples from representative localities.

Field investigations are conducted during the 1965-66 and 66-67 winters in the Whitefish Bay area of Lake Superior. Among the factors investigated were: ice thickness, structure, crystal size and orientation, floe characteristics, pressure ridge configuration and ice foot formation. Aerial photomapping provided control for selection of ice samples and a permanent record for additional investigations. Micrometeorological measurements were taken at Whitefish Point during the 1966-67 season with particular emphasis on global radiation in four spectral bands. Petrographic studies of the ice samples collected in the field are conducted in the cold laboratory.

During the 1967-68 winter season studies will be continued in Whitefish Bay and extended to other areas on and near Lake Superior.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0645, GREAT LAKES RESEARCH - ICE COVER DISTRIBUTION

E.W. MARSHALL, U.S. Army, Lake Survey, *Detroit, Michigan*
48226

2. WATER CYCLE

This investigation seeks to determine the changes that take place in the areal distribution, structure, and imagery of the Great Lakes ice cover throughout the winter.

Currently three methods and levels are employed: low level visual reconnaissance, up to 8,000 feet, medium altitude aerial photography, 23,000 feet, and high level satellite imagery, 400 to 800 nautical miles.

The visual aerial reconnaissance program provides the extent and relative concentration of ice. These observations are coordinated with those of the Canadian Department of Transportation which covers the Canadian portions of the Great Lakes. These observations provide a general synoptic view of ice conditions at 10-15 day intervals.

Aerial photomapping of the ice cover at the scale of 1:46,000 is carried out over eleven areas critical to Great Lakes shipping. Weather satellite imagery is monitored to aid in determining ice distribution and program planning.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0646, GREAT LAKES RESEARCH - GREAT LAKES DE-ICING

E.W. MARSHALL, U.S. Army, Lake Survey, Detroit, Michigan 48226

This investigation will prepare three reports (1) Annotated bibliography based on the world's literature on the natural conditions of the formation and decay of freshwater ice on lakes, harbors, rivers and locks as well as scientific and engineering information on techniques used to aid the delay of ice formation and to accelerate the ice in both fresh and marine environments. (2) A summary of the pertinent papers identified in the above and (3) A summary of information developed by the in-house projects of the Research Center on Great Lakes ice characteristics and areal distribution.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0647, GREAT LAKES RESEARCH - MONITORING OF WATER CHARACTERISTICS

A.P. PINSACK, U.S. Army, Lake Survey, Detroit, Michigan 48226

A system of permanent automatic monitor stations will be developed to continuously measure and record geophysical processes that affect or are influenced by the Great Lakes and their environment and to program observations for timely use in forecasts and control. As a first phase in this program continuous automatic water temperature recorders have been installed at 10 sites along the periphery of the U. S. portion of the Great Lakes. These stations will be removed as the comprehensive monitoring program develops.

Hourly water temperatures, daily and monthly mean temperatures at each of the ten sites are published regularly.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0648, GREAT LAKES RESEARCH - CHARACTERISTICS OF LAKE WATER

A.P. PINSACK, U.S. Army, Lake Survey, Detroit, Michigan 48226

The research involves collection, analysis, and interpretation of data pertaining or related to physical and chemical characteristics of the fresh water in the Great Lakes, including radiological contamination and sound propagation; definition of those water properties which may be utilized as indices of water characteristics and quality; and installation of permanent automatic monitor stations. The broad objectives are to investigate short term variations in water quality and properties, including the factors causing these variations, and to determine and monitor the long term trends. Energy budgets and chemical budgets will be developed to explain evaporation, lake currents and other physical variables.

Systematic collection of data on physical and chemical water characteristics, bottom sediments, meteorological parameters, and wave observations was performed during summer and fall 1965 in Lake Erie and in Lake Huron during the open water season 1966. A similar program will be carried out in the eastern basin of Lake Superior during the 1968 open water season.

Reduction, analysis and publication of data from Lakes Erie and Huron is in progress.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0649, GREAT LAKES RESEARCH - MONITORING OF WATER CHARACTERISTICS

A.P. PINSACK, U.S. Army, Lake Survey, Detroit, Michigan 48226

As a first phase in this program continuous automatic water temperature recorders have been installed at 10 sites along the periphery of the U. S. portion of the Great Lakes. These stations will be removed as the comprehensive monitoring program develops.

Hourly water temperatures, daily and monthly mean temperatures at each of the ten sites are published regularly.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0650, GREAT LAKES RESEARCH - EFFECTS OF STRUCTURES ON COASTAL SEDIMENTATION

J.H. SAYLOR, U.S. Army, Lake Survey, Detroit, Michigan 48226

Effects of man-made structures on environmental energy-sediment relationships, and the resulting effects on the beach and nearshore areas of the Great Lakes will be studied. Results are needed for the planning and design of shoreline structures, for methods to predict the changes in shoreline caused by such structures, and for assessing the efficiency of various structure designs.

Data on stream velocity, suspended sediment, and bedload sediment in the headwaters of the St. Clair River were collected under varying energy conditions extant in Lower Lake Huron during spring and fall of 1965. The site will be resampled at a later date down the St. Clair River and the sediment deposition pattern. A report on the amount and distribution of sediment in the river has been published.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0651, GREAT LAKES RESEARCH - COASTAL AREA SEDIMENTATION

J.H. SAYLOR, U.S. Army, Lake Survey, Detroit, Michigan 48226

Data on energy sources (waves, winds, currents) impinging on selected coastal reaches along the Great Lakes will be collected and studied to learn how environmental energy affects sediment movement, characteristics, and distribution in beach and nearshore areas. Results will be used to derive relationships and/or mathematical models. Investigations will devise methods of establishing rates of coastline change and how to forecast the future behavior of the coastline. Information is needed for the design and location of harbors, marinas, industrial plants, and recreational areas.

Data collection at Little Lake Harbor on Lake Superior was completed in 1964, and a report was presented at the Tenth Conference on Coastal Engineering held in Tokyo, Japan.

Data collection on Lower Lake Huron in the vicinity of Port Huron, Michigan and Sarnia, Ontario, was completed during 1965. Analysis of the data is in progress.

Preliminary investigations were conducted at Pentwater, Mich on the eastern shore of Lake Michigan during 1967. An intensive field program is planned at Pentwater during the spring and fall of 1969.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0652, EFFECTS OF WATER APPLICATION ON CROP PLANTS

R.L. CAROLUS, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Objectives: 1) To determine the minimum quantity of evaporating water required under varying levels of atmospheric stress parameters to assure optimum plant growth, development, and quality with a minimum application of water.

2. WATER CYCLE

Work Proposed: Soil surface, ambient air and plant temperatures (soil moisture, air humidity, and air movement) will be regulated and varied by water application, infra-red radiation and other procedures. The effects of the resultant variations in the plant micro-climate on transpiration levels, seedling emergence and plant growth, development and chemical and physical qualities will be evaluated for various horticultural crops. The optimum internal plant water balance for maximum net photosynthetic activity and crop productivity and quality will be delineated. The resulting data will be used to increase the efficiency of water utilization and for reducing the water requirement of crops.

2.0653, THE EFFECTS OF LIMNOLOGICAL FACTORS ON THE UPTAKE OF CS137 BY FISH N.R. KEVERN, Michigan State University, School of Agriculture, East Lansing, Michigan 48824

Cesium - 137, one of the potentially hazardous components of radioactive fallout, is accumulated by plants and animals, eventually reaching man through the food chain. Information about the behavior and fate of cesium in our environments would have predictive value should the levels of fallout increase. It has been shown that fish from different limnological lake types accumulate ¹³⁷Cs in widely different concentrations. This study is designed to investigate the relationships between pertinent limnological factors and the accumulation of ¹³⁷Cs by fish and as such broadly involves the fate of cesium in aquatic environments and biogeochemical processes in lakes.

A series of lakes near Gull Lake, Michigan and representing a range of factors was selected. Measurements are being made of alkalinity, specific conductivity, pH and temperature. Both fish and water are being made of alkalinity, specific conductivity, pH and temperature. Both fish and water are being analyzed for ¹³⁷Cs, stable Cs, K, and Na. Largemouth bass, common to all of the lakes, is the fish being studied. Stable Cs is being analyzed by the method of Feldman and Rains (Anal. Chem., 36:405, 1964) with an atomic absorption/emission spectrometer. The study was initiated in FY-1967 and will probably be completed in FY-1969.

2.0654, WATER REQUIREMENTS OF CROPS R.Z. WHEATON, Michigan State University, Agricultural Experiment Sta., East Lansing, Michigan 48824

Determine the use of water by crops, as influenced by climate, soils, and farming practices; basic relationships between soil moisture and crop production; optimum growth conditions for crops under various irrigation, fertilizer and management practices; and proper irrigation equipment design principles and operational practices as affected by peak moisture use, crop rooting habits, fertilizer practices, and other design factors.

Description of work: Eight plots are automatically covered by roofs whenever it rains. Four water regimes are maintained on these paired plots during the crop growing season by irrigation. The soil moisture level can be determined daily by an automatically operated recorder. When the moisture level in the surface 18 inches of a plot reaches a prescribed minimum level, it is irrigated with enough water to restore it to field capacity. Weather data including solar energy and pan evaporation are collected. Crop yield data are taken.

2.0655, METAMORPHOSIS OF SNOWPACK PROFILES AND CHANGES IN WATER STORAGE FOLLOWING STRIP CUTTING IN PINE FORESTS IN MICHIGAN D.P. WHITE, Michigan State University, School of Agriculture, East Lansing, Michigan 48824

To define in situ, using gamma ray attenuation techniques, the metamorphosis of snowpack profiles and changes in the water equivalent after strip cutting a jack pine forest in Michigan.

The increasing significance of groundwater as a source for municipal and industrial water supplies has prompted interest in the groundwater recharge of watersheds. In northern regions groundwater is recharged almost entirely from snow melt. On the Manistee National Forest, Michigan, this recharge was shown to be significantly less under pine populations than under hardwood forests. Interception and subsequent evaporation of snow from conifer crowns appears to be the major cause of the difference. Decreasing the crown density by strip cutting should allow a greater snowpack to accumulate on the ground thereby increasing the groundwater yield of pine forests.

A 'two-probe density gauge' employing the principle of gamma ray attenuation will be used for the first time in the Lake States to intensively measure, in situ, weekly changes in the internal hydrologic characteristics of the snowpack resulting from strip cutting practices. Strip cut and uncut areas in a 34-year-old jack pine plantation on the Manistee National Forest, Michigan will be used for the project. Six-foot access tubes for the 'two-probe density gauge' will be installed two feet into the soil. Measurements of snow density, snow water content, and soil moisture can be measured in successive one-half inch increments. A pyrheliometer and a hygrothermograph will be placed in the study area to measure solar radiation, humidity, and temperature. Data from these measurements will be analyzed for correlations to the snowpack behavior.

2.0656, INTERRELATIONS OF SEVERAL ABIOTIC FACTORS AND THE HIGHER AQUATIC PLANTS OF A STREAM ECOSYSTEM

R.G. KULLBERG, Michigan State University, W.K. Kellogg G. Lk. Biol. Sta., Hickory Corners, Michigan 49060

The project will be concerned with the effect of several abiotic factors on the higher aquatic plants of a stream as well as the reciprocal effect of the higher aquatic plants on part of the environment. The water passes from a trout stream, past a paper mill, and then into a larger stream. An attempt will be made to correlate several abiotic factors of the stream with the kinds of species, their numbers, and their volumes at measured intervals.

2.0657, DESIGN TO CONTROL EROSION IN ROADSIDE DRAINAGE CHANNELS

A.G. ANDERSON, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

The highway drainage engineer is required to provide designs to control erosion in roadside drainage channels over a wide range of conditions. Criteria are being established and existing procedures extended for conditions where easily established grass cover will suffice and for conditions where paved linings are required. The major emphasis of the research is on the development of a procedure for design of armored channels, with investigations into the critical tractive force of gravel and crushed stone and the mechanism of leaching of finer soils and sediments through the stabilizing layers. A literature review of items pertaining to the design of armored channels has been completed and design criteria developed utilizing information obtained from the literature. The criteria will contain two different applications. One will be for stream relocations and other channels that, from a design standpoint, are treated as individual problems. The second application will be a simplified procedure, using charts and curves, for designing aggregate linings for standard sizes and shapes of roadside ditches. The latter should be particularly applicable in more arid areas where establishment of turf is difficult.

2.0658, FREE-STREAMLINE FLOW OVER DISCONTINUITIES IN A BOUNDARY LAYER

A.G. ANDERSON, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

2. WATER CYCLE

Discontinuities on the solid boundaries guiding a high speed flow may produce a cavitating or supercavitating flow. A theoretical and experimental study of free-streamline flow over discontinuities and slender bodies in a fully developed boundary layer will be undertaken. In the theory steady two-dimensional, rotational flow with negligible viscosity will be considered. Perturbation potentials to represent the boundary discontinuities and velocity potentials that satisfy a Poisson type equation for the particular boundary conditions involved will be introduced. The solution will be obtained numerically and results will be presented in graphical form. The experimental program will provide information concerning the physical aspects of supercavitating rotational flow in a boundary layer and such characteristics as drag and cavity lengths associated with various types of bodies under these flow conditions will be measured. The experimental apparatus, with only minor modifications, is now available. The work will be performed at the St. Anthony Falls Hydraulic Laboratory.

SUPPORTED BY U.S. National Science Foundation

2.0659, EVALUATION OF SELECTED COMPUTER PROGRAMS IN HYDROLOGY

C.E. BOWERS, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

The research will evaluate some existing computer programs and mathematical models relating to the analysis of storm runoff and flood routing. Selected new mathematical models and computer programs will be investigated and compared with established methods to determine the magnitude and nature of differences between new and established methods. Programs that appear to have special merit relative to hydrologic analysis for determination of design floods and for design of spillways and related structures will be selected. Possible factors of safety or other criterion that should be used by practicing engineers will be developed. The research should assist hydrologists in determining peak rates of runoff and flood routing, and in making frequency analysis of hydrologic data by use of new and established computer techniques.

2.0660, CHEMICAL STUDIES ON THE WATERS AND SOILS OF LAKES AND WETLANDS, WITH SPECIAL REFERENCE TO MINOR ELEMENTS

E. GORHAM, Univ. of Minnesota, Graduate School, Minneapolis, Minnesota 55455

As may be seen from G. E. Hutchinson's Treatise on Limnology (1957) very little is known of the distribution of minor elements in the waters and sediments of lakes, and even less is known of their distribution in wetland ecosystems. The influences of geological, climatic, topographic and especially biological factors upon their cycles have scarcely been investigated, and their changes in concentration during lake or wetland evolution, as recorded in sediment cores, have only been examined in a cursory way in a very few cases. It therefore appears desirable to undertake intensive studies of minor elements in relation to the 'metabolism' and regional typology of lakes and wetlands. The diversity of lakes in Minnesota -- from acid and dilute waters on the northeastern Laurentian Shield to saline and alkaline potholes in the southwest -- makes the state a most suitable area for regional studies in chemical limnology. Moreover, because of the hundreds of square miles of peatland on the old glacial lake Agassiz basin of northern Minnesota, and the very numerous peat-filled kettle-holes of the southern part of the state, Minnesota is also an excellent area in which to study chemical aspects of wetland ecology.

2.0661, COUPLING OF FLOWS AROUND AND THROUGH POROUS MEDIA

D.D. JOSEPH, Univ. of Minnesota, School of Engineering, Minneapolis, Minnesota 55455

This grant will provide continued support for experimental research on coupling conditions for fluid motions in the neighborhood of the boundaries of permeable materials. Coupling conditions are considered as those conditions satisfied at the boundary of a permeable material by a fluid which flows around and through this material. In particular, an examination of these flows for effects of boundary layers within the permeable material will be made.

The research is presently in a data-producing phase. There is one operating experiment and a number of preliminary results. It is expected that within the next two years there will be sufficient reliable experimental data to infer physically valid boundary conditions for the coupled motion.

SUPPORTED BY U.S. National Science Foundation

2.0662, THE IMPROVEMENT OF SOILS DEVELOPED UNDER FOREST VEGETATION

A.F. ARNEMAN, Univ. of Minnesota, Agricultural Experiment Station, Saint Paul, Minnesota

The objectives of the study are: a) to characterize soil morphologic features in soils developed under forest vegetation. b) to define chemical, mineralogical, and physical properties of the profile which affect root development. c) to design and test chemical and physical practices which will improve these soils.

The work proposed, initially, is a study of an area of about 20 acres on typical drumlin topography of north central Minnesota (Wadena Co). In this area a detailed morphologic investigation of the soil profile occurring over the total topography will be made. Thin-section morphologic study will be employed. Hydrologic investigations using applied water will include description of the table as it occurs naturally or in the 'perched' condition. Root distributions will be investigated.

2.0663, WATER ADSORPTION AND ITS INTERACTIONS WITH CLAY AND QUARTZ

G.R. BLAKE, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

Reactions of water with clays and quartz in soils govern to a large extent the behavior, storage and flow of water into, through and within the soil moisture reservoir. Furthermore the water-clay matrix changes with time and with the formation and deterioration of aggregate-dependent structure.

It is proposed to study water-clay interaction in soil samples and in pure clay-quartz mixtures. Time dependent changes in water adjustment and in clay-quartz bond strengths will be investigated. Backswelling of equilibrium dried aggregations will be investigated as affected by formation and storage conditions of the prepared samples. Development of improved techniques for equilibrating soil water at known free energy levels, for measuring interparticle bond strengths, and for measuring swelling will be attempted.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

2.0664, CHARACTERISTICS OF THE SOIL MATRIX THAT AFFECT WATER STORAGE AND MOVEMENT

G.R. BLAKE, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

Objectives of the research proposed in this project are to investigate: A. Water storage and release from the soil as related to the matrix characteristics. B. Reactions occurring between water, clay and quartz during initiation, growth and stabilization of domains in the soil matrix that affect the storage and movement of water.

2.0665, STUDY OF FACTORS AFFECTING THE CHANNEL PHASE OF RUNOFF FROM SMALL WATERSHEDS BY MATHEMATICAL MODELING

C.L. LARSON, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

The lead phase determines the volume of runoff and the channel phase its time distribution and depends on the physical characteristics of the channel system. A new time parameter, time to virtual equilibrium, appears to be very useful, but its relationship to channel characteristics has not been determined. A detailed mathematical model of a watershed channel system will be developed, including tributary channels. The length, cross section, slope and roughness of each segment of channel will be varied independently. The input to the system will be overland flow of various durations and rates. The flows will then be routed through the various channel segments by the use of the basic equations of fluid mechanics governing non-steady flow in open channels, using finite difference solutions and a CDC 1604 digital computer. The results will be used to develop, if possible, a general relationship between channel characteristics and the time parameter. The model will also be used to check the tentative relationship of the time parameter to runoff time distribution for a variety of watershed sizes and slopes. The data obtained in a laboratory study will be used to develop a mathematical model of unsteady flow at a junction that will accurately describe the effect of a branch channel on the flow in the main channel both above and below the junction.

2.0666, EFFECTS OF AREAL AND TIME DISTRIBUTION OF RUNOFF SUPPLY ON WATERSHED HYDROGRAPHS

C.L. LARSON, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

A mathematical model watershed recently developed will be modified for use in this study. In the model, the physical characteristics of all channels of a fourth-order, 21.35 sq. mi., idealized but representative watershed are specified. Runoff supply excess rainfall is routed through the channel system by means of the differential equations governing unsteady flow, in finite difference form for numerical solution. The model will be modified to permit variations in areal distribution of runoff supply over the watershed. Experiments will be made with spatially varied input to the model, and the results will be used to determine what degree of (storm) coverage causes maximum outflow. The shape of the watershed will then be varied systematically to determine the effects of typical shape types and various length width ratios on peak discharge.

For another series of experiments, an overland flow model which will accommodate variable and intermittent supply will be incorporated into the model. Experiments will then be conducted with various time patterns of runoff supply that can be expected on natural watersheds to determine the magnitude of these watershed effects. In all of the tests, results will be related to runoff processes and watershed characteristics to facilitate application.

2.0667, THE EFFECT OF THE NATURAL SEALING OF POTHoles UPON WATER MOVEMENT AND GROUND-WATER RESOURCES

P.W. MANSON, Univ. of Minnesota, School of Agriculture, Saint Paul, Minnesota

The research is aimed at determining the effect of the natural sealing of potholes upon water movement into the underlying subsoil and the effect of this water movement upon groundwater resources. Four typical potholes will be selected from each of four geological environments in Minnesota. The potholes will be instrumented to measure all water inflow and all water outflow. The

sediments beneath and surrounding these four potholes will be sampled and carefully studied for permeability and sealing characteristics. Soil borings will be made to determine the water table position and the soil water movement patterns beneath and around the potholes. Vertical and horizontal borings will be made underneath and around the potholes into which instruments will be placed to observe and study the 'unsaturated flow'.

2.0669, ANALYSIS OF PUBLIC INVESTMENTS IN NATURAL RESOURCES WITHIN MINNESOTA

R.D. VLASIN, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

The overall objective is to improve investments in natural resources in Minnesota for such purposes as parks, recreation and wildlife, water developments, land improvements, drainage, flood control, waste disposal, and forestry. The project will (1) develop a framework showing investments by various governmental units; (2) determine organizational and operational features of various resource districts; (3) compare existing special districts with existing and proposed multi-county districts; and (4) develop suggestions for alternative organizational and operational arrangements to improve investment decisions.

Description of Work: The first part will involve an inventory and categorization of natural resource expenditures by various resource districts and other governmental units from secondary sources. The second part of the project will involve an evaluation of organizational and operational characteristics of selected existing and proposed districts for the development and management of natural resources. The third part, building upon the earlier phases, will develop suggestions for decision making by districts. Attention also will be given the economic and related consequences of vesting investment decisions in other governmental units.

2.0670, COOPERATIVE GULF OF MEXICO INVENTORY AND STUDY - II HYDROLOGY

J.Y. CHRISTMAS, State Marine Conserv. Comm., Biloxi, Mississippi

During 1966, basic information will be gathered on the time and duration of the run of each species of Alosa (with the exception of Alosa sapidissima) which enters the Connecticut River. Physical data will be gathered and temperature will be constantly monitored near the mouth of the river. The entering adults will be sampled with gill nets and lengths, weights and sex will be recorded. Scale samples will be taken for age determination. This sampling will continue periodically during the entire run. The techniques worked out and the basic data gathered at this time will be used to plan a more intensive study to be conducted in 1967 and 1968.

A survey will be made to ascertain the major spawning areas of each species. This area will be sampled with gill nets, seines and plankton nets to determine the species present and if spawning

2. WATER CYCLE

has occurred. Physical and chemical data will also be collected at this time.

This preliminary survey augmented by information gathered on the other sub-projects shown enable us to design an intensive survey which will be carried out in 1967 and 1969.

The laboratory facilities of the University of Connecticut, Marine Research Laboratory will be utilized for this sub-project.

2.0671, COOPERATIVE GULF OF MEXICO INVENTORY AND STUDY - III SEDIMENTOLOGY

J.Y. CHRISTMAS, State Marine Conserv. Comm., Biloxi, Mississippi

Objectives: (1) To determine the sediment forms of Mississippi estuaries as an index of their respective conditions. (2) To establish a base line for the evaluation of expected changes in sediment distribution and its effect on the biota. (3) To develop an atlas of the sediments of Mississippi estuaries. (4) To make the state atlas available, in cooperation with the other Gulf States and the Bureau of Commercial Fisheries, for inclusion in an atlas of Gulf of Mexico estuaries.

Procedures: (1) Locate and complete existing data for textural analysis (sand, silt and clay) and carbonate, carbon, and nitrogen content in the study area. (2) As time permits, collect and analyze additional samples in a pattern arranged to complete a description of the sediment distribution pattern in the study area. (3) Collect, analyze and prepare data in a state atlas in a form which will be available for incorporation as a section in an atlas of the estuaries of the Gulf States in cooperation with members of the Gulf States Marine Fisheries Commission and the Bureau of Commercial Fisheries. (4) Prepare and publish additional notes and papers as necessary.

2.0672, COOPERATIVE GULF OF MEXICO INVENTORY AND STUDY - IV BIOLOGY

J.Y. CHRISTMAS, State Marine Conserv. Comm., Biloxi, Mississippi

Objectives: (1) To determine the major commercial species of aquatic fauna and their respective nursery areas, seasonal distribution and utilization. (2) To determine or estimate, from the best available information, the value of harvested species in or resulting from Mississippi estuaries. (3) To determine the correlation between hydrological characteristics and relative abundance of selected organisms. (4) To determine the type and distribution of aquatic vegetation. (5) To make the Mississippi atlas available, in cooperation with other Gulf States and the Bureau of Commercial Fisheries, for inclusion in an atlas of Gulf of Mexico estuaries.

Procedures: (1) Sample benthic, planktonic and pelagic vertebrate and invertebrate forms to indicate quality and relative abundance of these groups. (2) Collect hydrographic samples in conjunction with biological samples. (3) Determine relationship of relative abundance of selected organisms to existing environmental conditions. (4) Type map aquatic vegetation and record associated dominant emergent vegetation as time permits. (5) Collect, analyze and prepare data in a state atlas in a form which will be available for incorporation as a section in an atlas of the estuaries of the Gulf States in cooperation with members of the Gulf States Marine Fisheries Commission and the Bureau of Commercial Fisheries. (6) Prepare and publish additional notes and papers as necessary.

2.0673, IRRIGATION

J.A. CAMPBELL, Mississippi St. University, Agricultural Experiment Sta., Crystal Springs, Mississippi

a. To determine the response of various vegetable crops to irrigation during periods of drought as measured in yield, quality and profit. b. To determine the interaction effect of irrigation

with various fertilizer treatments and varieties on yield and quality. c. To study methods of management and the economics of maintaining and operating irrigation systems for both the sprinkler and furrow flood methods for a 30 to 40 acre truck farm.

Description of work - During periods of drought irrigation studies will be set up on field experiments already in progress that are adapted to a modified split plot arrangement which will be used. Records on man hour requirements, fuel consumption and depreciation will be kept in order to determine cost of operation. Mechanical improvisations will be made and tested for the purpose of reducing cost and facilitate handling of equipment.

2.0674, DEVELOPMENT OF SPECIAL REHABILITATION TECHNIQUES AND FOREST MANAGEMENT PRACTICES FOR USE ON SEVERELY ERODED OR HIGHLY ERODIVE WATERSHEDS

D.C. MCCLURKIN, U.S. Dept. of Agriculture, Oxford, Mississippi

Object: To develop improved methods of establishing and maintaining vegetation and litter on eroded sites throughout the South for the reduction of storm runoff, erosion and sedimentation; and to develop and test, on a pilot scale, timber management techniques that will permit economic utilization of forests from rehabilitated and erosive watersheds without inducing a new cycle of erosion.

Plan of work: The project staff is engaged in (1) development of methods for establishing protective covers more promptly, especially on the more difficult sites; and (2) prevention of excessive runoff and erosion in connection with the conduct of silvicultural operations on erosive sites of the South.

Cooperation: University of Mississippi; ARS Sedimentation Laboratory; Soil Conservation Service; TVA.

SUPPORTED BY U.S. Dept. of Agriculture

2.0675, SEDIMENT YIELD IN RELATION TO CLIMATIC AND WATERSHED CHARACTERISTICS IN THE SOUTHERN BRANCH

D.A. PARSONS, U.S. Dept. of Agriculture, Oxford, Mississippi

Object: To develop procedures and criteria for predicting the sources, amounts, and characteristics of sediment yield from agricultural watersheds of varying size in the principal physiographic and climatic regions of the Southern States.

Plan of work: Information on quantities of sediment carried by streams is obtained by means of reservoir sedimentation surveys and through suspended load sampling on selected watersheds. Records of precipitation, runoff, topography, channel characteristics, soils and geology, land use, conservation practices, and watershed treatment measures are compiled for the areas for which sediment yield records are available. Studies are made to determine and evaluate the processes and rates of erosion on land surfaces including gullies, roadbanks, and stream channels. Radio-active elements and other tracers are used in studying the movement of sediment from erosional sources to points of deposition. Required instrumentation is developed. Data on sediment yield rates and associated causal factors are analyzed and interpreted to derive improved techniques and equations for estimating sediment yield and sources in ungaged watersheds. The physical, chemical and biological attributes of the transported sediments are of concern and measured.

SUPPORTED BY U.S. Dept. of Agriculture

2.0676, THE NATURE AND PROCESSES OF RESERVOIR SEDIMENTATION IN THE SOUTHERN BRANCH AND AT THE USDA SEDIMENTATION LABORATORY

D.A. PARSONS, U.S. Dept. of Agriculture, Oxford, Mississippi

Object: To develop procedures and criteria for predicting the distribution of reservoir sediment; sediment densities; trap-efficiency; delta developments and the characteristic rates of storage depletion by sedimentation for reservoirs and ponds affected by agricultural watersheds in the Southern States.

2. WATER CYCLE

Plan of Work: The program includes reservoir sedimentation surveys; topographic mapping of reservoir basins; measurement of both water and sediment inflow and outflow; tracing of water and sediment movement, including study of density currents in reservoir basins; characterization of basins as to topographic forms, shapes, and capacity -- watershed and capacity-inflow ratios; measurement and study of variations in the density and texture of deposited sediment, and study of the processes of delta formations within basins and their extension upstream beyond the backwater of the reservoir. Particular attention is devoted to development of new and improved instrumentation and sampling techniques, such as radioisotope probes, for measuring the density of deposited sediment and for making reservoir sedimentation surveys. Records are compiled to relate the rates and processes of reservoir silting to sediment yield from agricultural watersheds and to fluctuating levels of water storage.

SUPPORTED BY U.S. Dept. of Agriculture

2.0677, MECHANICS OF SEDIMENT ENTRAINMENT, TRANSPORTATION AND DEPOSITION IN CHANNELS OF THE SOUTHERN BRANCH AND AT THE USDA SEDIMENTATION LABORATORY

D.A. PARSONS, U.S. Dept. of Agriculture, Oxford, Mississippi

Object: To advance existing knowledge and to develop new and improved equations and formulae for calculating sediment movement and deposition in natural and artificial stream channels in agricultural watersheds.

Plan of Work: Sediment transport is studied in natural and artificial streams and in hydraulic laboratory flumes. Field measurements include rate and depth of flow, rate and volume of transport of bed and suspended load, geology and vegetation at the site and other factors. Flume studies are made to provide a means of controlling variables and of clarifying relationships. Related phenomena such as dune and anti-dune bed configuration, surface waves, and the hydraulic roughness are observed. Instruments and techniques needed to measure and/or compute rates of flow, sediment content and channel dimensions during the flow are devised and tested.

SUPPORTED BY U.S. Dept. of Agriculture

2.0678, INVESTIGATIONS OF STREAM CHANNEL MORPHOLOGY IN THE SOUTHERN BRANCH AND AT THE USDA SEDIMENTATION LABORATORY

D.A. PARSONS, U.S. Dept. of Agriculture, Oxford, Mississippi

Object: To establish the regime behavior of natural and artificial channels as influenced by hydraulics of flow, changes in flow pattern, sediment and channel alluvium characteristics and channel roughness; and to determine for channel reaches and bends the relationship between shear stresses and boundary velocities and the scour resistance properties of cohesive and non-cohesive channel periphery materials.

Plan of Work: The field program includes selected channel reaches where flow regime, physical and chemical properties of channel materials such as percent clay, permeability, plasticity indices, dispersion ratios, and shear strength, and shear stresses such as tractive force and shear velocity, are determined. Laboratory experiments are carried out in models and flumes to isolate individual variables and establish fundamental relationships between measured shear forces and known characteristics of soil horizons for a range in both hydraulics of flow and the composition of channel periphery material. Undisturbed samples of known characteristics from field locations are tested under laboratory conditions. Channel meander patterns such as meander belt width, degree of sinuosity, and radius of curvature, and channel geometry factors such as width-depth ratios, width-area ratios, and thalweg gradients, will be determined for correlation with the type of alluviums in the stream channels. Close coordination is maintained between field and laboratory investigations.

SUPPORTED BY U.S. Dept. of Agriculture

2.0679, THE EFFECT OF TEMPERATURE ON WATER FLOW IN SOILS

R.D. JENSEN, Mississippi St. University, Agricultural Experiment Sta., State College, Mississippi 39762

Theoretical aspects of the effect of temperature on water flow in soils have developed more rapidly than the experimental phases. This project is a basic experimental study on the effect of temperature on water flow in soils. The principal objectives are: (1) To determine the type of flux equation which adequately describes the flow of water in soils under non-isothermal conditions. (2) To study the temperature dependence of the conductivity function in unsaturated soil (3) To study the effect of temperature on the pressure head of soil water. (4) To determine the magnitude of the thermal water diffusivity coefficient. (5) To determine, if possible, the nature of the mechanism(s) involved in the transport of water in soils subjected to a temperature gradient.

The soil will be enclosed in specially constructed columns which permit the application of a temperature gradient across the sample and the simultaneous measurement of temperature, pressure head and water content at various positions in the soil sample. The temperature will be measured with thermistors, the pressure head with strain gauge transducer type tensiometers and the water content with gamma absorption apparatus.

2.0680, EFFECT OF SOIL DISTURBANCE ON THE PRESSURE HEAD OF SOIL WATER

R.D. JENSEN, Mississippi St. University, Agricultural Experiment Sta., State College, Mississippi 39762

Objectives: 1. To determine the effect of mechanical disturbance of the soil on the pressure head of soil water. 2. To determine the magnitude and practical importance of changes in pressure head, due to mechanical disturbance of the soil, in different textured soils as a function of the water content. 3. To determine if possible, the nature of the phenomena responsible for altering the pressure head when the soil is mechanically disturbed.

Work Proposed: Pressure head measurements will be made on selected soils with a wide range of soil textures at different water contents before and after disturbance of the soil. Mechanical-type disturbances, due to such procedures as mixing, stirring, sieving, packing, etc., which cause a rearrangement of the soil particles, will be the kind of disturbance which will be investigated. The soil will be disturbed in such a manner that the water content of the soil does not change.

2.0683, INTERRELATION OF MOISTURE REGIME & NUTRIENT LEVELS OF SELECTED MISSISSIPPI SOILS & THEIR RELATION TO THE SITE INDEX OF LOBLOLLY PINE

W.F. MILLER, Mississippi St. University, Agricultural Experiment Sta., State College, Mississippi 39762

The objective of the study are to establish a valid expression of moisture regime for the various site situations encountered in forest-tree productivity studies, to evaluate the interrelation of moisture regime and nutrient levels and to establish a relationship between moisture regime, nutrient level and site index of loblolly pine.

The study is designed to evaluate the factors of site that are most prominent in the determination of moisture regime. Loblolly pine is used as the indicator species and the soil variables are limited by sampling only on members of the Ruston and Norfolk catenas throughout their range of occurrence in Mississippi. Both bulk soil samples and undisturbed samples are collected from horizons in the profile of each plot. Major emphasis is placed on the differentiation of physical soil properties by means of comparisons of desorption curves constructed for each plot from the undisturbed soil samples. Tension measurements are made at 60 cm. 1/10, 1/3, 2/3, 1/4, and 15 atmospheres. Also to be evaluated are climatic and topographic variables. Foliar nutrient studies will be made as soon as a supplementary study clearly indicates the proper time of year for sampling.

SUPPORTED BY Mississippi State Government

2.0684, FACTORS INFLUENCING PLANT TRANSPIRATION IN THE SOUTH

D.L. MYHRE, Mississippi St. University, Agricultural Experiment Sta., State College, Mississippi 39762

Object: To determine (1) the effects of quantity and quality of radiant energy, humidity, ambient temperature, and CO₂ concentration on transpiration, stomatal behavior growth and apparent photosynthesis, (2) possible pathways of starch and sugar synthesis in guard cells and the effect on transpiration, (3) the soil moisture extraction pattern and use rate of crops in the field.

Plan of Work: Research will be conducted in the growth room where close controls of ambient temperature, humidity, CO₂, soil moisture tension and light intensity are possible. Radiant energy equivalent to full sunlight can be attained. The relation of these factors to plant transpiration will be studied. Physiological studies of starch and sugar accumulation in guard cells will be stressed. Parallel studies will be made of the moisture extraction patterns and use rates of a number of crops under varying soil management systems.

2.0685, CHANGES IN NATURAL CHANNELS RESULTING FROM CONTROL DEVICES IN THE UPPER REACHES OF THE BASINS

A. SHINDALA, Mississippi St. University, School of Engineering, State College, Mississippi 39762

The intensity of man's activities in altering the character of small drainage basins may have serious and unforeseen effects upon the main stream. Such activities as the construction of retention reservoirs and channel changes must certainly affect the flow and the channel of the main stream. In striving for benefits in the upstream regions, the possibility of undesirable effects on the main stream may have been overlooked.

This study is designed to provide information on the effects of rather intense activities aimed at control of flow and sediment in some of the streams which flow from the escarpment into the

Delta region of Mississippi. However, the results of the study will be of general value.

2.0686, COMMITTEE ON CHANNEL STABILIZATION

J.H. DOUMA, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi

The objectives of the Committee, with respect to channel stabilization of alluvial rivers, are: (a) to review and evaluate pertinent information and disseminate the results thereof; (b) to determine the need for, recommend, and have advisory technical review responsibility for research; (c) to determine basic principles and design criteria; (d) to provide, at the request of field offices, advice on design and operational problems. Three meetings of the Committee on Channel Stabilization will be held during the year. At each meeting, one or more channel stabilization problems of major concern to the Corps of Engineers will be considered by the Committee. In addition, the Committee will exercise technical supervision over ES 841, Water Temperature Effects on Bed Forms; and will develop and recommend additional research needed in connection with alluvial river channel stabilization. The Committee will render such consultation and advice as may be requested on specific problems referred to it by offices of the Corps of Engineers. Data and information obtained or developed by the Committee which are considered pertinent to problems in alluvial river channel stabilization will be distributed to all interested agencies through Committee reports and technical papers.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0687, SALINITY INTRUSION AND RELATED PHENOMENA

H.B. SIMMONS, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi

The objective of this project is to determine, for conditions of open channels subject to salt-water intrusion and tidal oscillations from the sea, the factors which control the extent of salinity intrusion, the degree of vertical mixing of salt and fresh water, the magnitudes and durations of current velocities at all depths, and the movement and deposition of sediments as influenced by density effects.

2.0688, TIDAL FLOWS IN RIVERS AND HARBORS

J.B. TIFFANY, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi
SCHULTZ

The committee known as the Committee on Tidal Hydraulic has been established consisting of civilian employees in various Corps of Engineers Division Offices, District offices, and laboratories who are familiar with tidal theories and tidal problems. The objectives of the Committee are to recommend programs of study, investigation, and research designed to provide the knowledge necessary to arrive at adequate solutions for the engineering problems associated with tidal phenomena, and to render such consultations and advice on specific problems in tidal waterways as may be requested by various offices of the Corps of Engineers.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0689, GENERAL COASTAL INLET STUDIES

J.B. TIFFANY, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi

The objective of this research project is to develop means for computing discharge and velocity distribution through tidal inlets leading to determination of tidal prisms and water surface elevations in inner bay systems; and to determine the factors involved in both inner and outer bar formation, the shoaling of inlet channels, and the stability of inlet shape and location. The following four facilities are being used to conduct necessary investigations: 1. Facility A. This is a facility in which inlets of various shapes can

2. WATER CYCLE

be modeled to a relatively large scale, and tests conducted therein under varying tidal conditions to establish discharge coefficients, flow patterns, and other factors required to compute discharges over the range of head differentials. 2. Facility B. This facility consists of an 'ocean' in which tides of various amplitudes and periods could be generated, a lagoon which could be varied in areas and shapes, and a connecting section between the two in which inlets of various shape could be modeled to a small scale by standard fixed-bed model techniques. 3. Facility C. This facility consists of a movable-bed model ocean, equipped with appurtenances for reproducing tides, waves, littoral currents, and other significant forces; a fixed-bed lagoon which could be varied in area and shape; and provisions for connecting the two by means of a movable-bed inlet section in which inlets of various shape could be modeled by movable-bed model techniques. 4. Facility D. An existing 350-ft by 175-ft basin now in existence at the Coastal Engineering Research Center will be used to develop information on the distribution and quantity of along-shore littoral drift, as a function of wave height, wave length, and other significant factors.

2.0690, SHOALING PROCESSES

J.B. TIFFANY, U.S. Army, Waterways Experiment Sta., Vicksburg, Mississippi
SCHULTZ

The scope and objectives of this engineering study are as follows: (a) To determine the basic laws involved in the movement and disposition of muddy sediments; (b) to determine the effects of repetitive scour and deposition on sedimentation; (c) to develop techniques for radioisotope tracing of sediment movement and deposition; (d) to develop an in-place turbidity meter; (e) to determine the effects of stabilization of deposits on shoaling; (f) to determine the effects of flocculation on shoaling; (g) correlation of prototype data to determine the similarity, or lack thereof, of shoaling processes among estuaries or groups of estuaries; (h) classification of sediments which form shoals in estuaries or other tidal waterways improved for navigation; (i) to determine the facts which affect hydraulic and shoaling conditions in navigation slips and tributary channels which are improved for navigation; (j) to standardize sediment and soil sampling techniques in tidal waterways and to determine suitable methods for the packaging and transportation of samples; (k) to develop reliable methods for the predicting tides and currents in tidal waterways. Field investigations and laboratory studies are presently being conducted under the auspices of the Committee on Tidal Hydraulics to accomplish many of the objectives listed above. The lack of adequate space on this form prohibits discussion of each individual investigation under this project.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0691, ENERGY AND WATER BALANCE

G.S. COX, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

Objectives - A. To determine energy and water fluxes through soil plant interfaces of certain forest and range sites. B. To utilize the heat balance of the plant community to determine rates of evapotranspiration from growing canopies of forest and adjacent grass openings, and to compare this with the evapotranspiration determined by the water balance method.

Description of Work - Plots will be established in a well-stocked hardwood forest stand and an adjacent grass opening. Radiation will be measured by net radiometers. Energy transfer to and from the soil will be determined by thermopiles. Total air movement will be measured. Soil moisture measurements will be taken with a neutron meter.

The evapotranspiration from each area will be determined from the meteorological data and by the water balance method.

SUPPORTED BY U.S. Dept. of Agriculture

2.0692, RATE OF EVAPOTRANSPIRATION

W.L. DECKER, Univ. of Missouri, School of Agriculture, Columbia, Missouri 65202

Investigations into the manner in which meteorological elements control agricultural drought by the movement of water from the earth to the atmosphere under various conditions. Specifically, the objective is to conduct studies on the energy budget of crops under Missouri's environmental conditions. This includes the measurement of factors such as net radiation, air temperature, atmospheric humidity, air movement and precipitation, the correlation of these observations with the response of crops insofar as yield and water use are concerned; and the study of the effect of environment on the radiation balance between the atmosphere and cropped surfaces.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.0693, INFLUENCE OF ENERGY BUDGET ON AGRICULTURAL PRODUCTION

W.L. DECKER, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

Objective: To measure the water used by agricultural crops and to relate the energy budget of the surface to water use by plants.

Procedure: Measurements of the evapotranspiration for agricultural crops in Missouri will be made. These measurements will be related to concurrent environmental factors including radiational exchanges, evaporative demands of the air mass and soil heat flux. Attempts will be made to modify the environmental conditions for the reduction of evapotranspiration.

SUPPORTED BY U.S. Dept. of Agriculture
Missouri State Government

2.0694, RAINFALL OVER MISSOURI

W.L. DECKER, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

Objectives: A. To obtain precipitation observations from established stations and reduce the data. B. To correlate the rainfall occurrences with natural geographic features. C. To supply required data for the analysis of the cloud seeding experiment of Project Whitetop.

Rainfall data will be taken from recording rain gages in areas over Missouri. The intensity and amount of precipitation will be correlated with geographic features of the area.

Missouri State Government

2.0695, THE USE OF WATER IN THE PRODUCTION OF HORTICULTURE CROPS

A.D. HIBBARD, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

Objectives: 1. Utilization of the reserve moisture supply. 2. Cumulative effect of recurring moisture deficiency. 3. Effect of moisture stress on product quality. 4. Soil management and moisture supply.

The available moisture conditions throughout the rooting zone of selected horticulture crops will be continuously monitored with suitably placed moisture sensing units. Controlled conditions will be obtained through irrigation to maintain the desired level of available moisture. Stress conditions will be imposed by the protection of the soil area above the root zone from precipitation. Rate, zone and extent of soil moisture depletion will be measured and the apparent consumptive use rate established. The competition for moisture between plants of the same crop and associated plants will be determined. The effects of moisture stress with reference to time of season and duration on plant response and product quality factors will be measured.

Missouri State Government

2.0696, NON-EQUILIBRIUM TRANSPORT OF SUSPENDED SEDIMENT

C.W. LENAU, Univ. of Missouri, School of Engineering, Columbia, Missouri 65202

It is proposed to investigate the non-equilibrium transport of suspended sediment in natural channels. The major intent is to

2. WATER CYCLE

determine the distribution of suspended sediment downstream from a section where the water is initially free of sediment.

The approach will be to view the movement of the suspended sediment as a concentration-diffusion process and to solve the conservation of mass equation with the appropriate boundary conditions. No experimental verification is proposed.

The solution will be useful to determine the channel length required to establish equilibrium in the bed load for laboratory experiments which use movable-bed flumes.

University of Missouri

2.0697, STAND TREATMENT

J.M. NICHOLS, Univ. of Missouri, Agricultural Experiment Sta.,
Columbia, Missouri 65202

Determine the effect of cutting methods (as they influence stand stocking and structure) and semi-controlled periodic flooding on the seed production and regeneration of bottomland hardwood species.

DESCRIPTION OF WORK - The study will consist of 36 one-half-acre plots. Of these, 18 will be on flooded areas and 18 on areas not flooded. Three degrees of stocking (low, medium, heavy) will be tested, plus two types of stand structure (small and large trees). Periodic fall collections will be made from 900 seed traps. Data analysis will include effects of the variables of water table manipulation on mast production.

2.0698, THE RELATIONSHIP BETWEEN ADSORPTION AND PERMEABILITY

R.A. PRIMROSE, Univ. of Missouri, School of Engineering,
Columbia, Missouri 65202

This investigation proposes to study the inter-relationship between permeability and adsorption by making plugs formed by compressing powdered barrier material such as silica, polystyrene, cellulose acetate, and silicone rubber, and measuring the amount of permeation and the amount of adsorption of these plugs toward various gaseous materials. The initial mixture is planned to be carbon dioxide and propene because of their equal molecular weight, thus any observed differences in behavior will be caused by some difference in attraction. Other barrier materials and other gaseous systems will undoubtedly be investigated in an effort to define the inter-relationship between adsorption and permeability.

SUPPORTED BY U.S. National Science Foundation

2.0699, THICKNESS OF SOIL SOLUM AS A PARAMETER OF PLANT-AVAILABLE WATER STORAGE CAPACITY IN SOILS UNDERLAIN BY CARBONATE ROCKS

C.L. SCRIVNER, Univ. of Missouri, School of Agriculture,
Columbia, Missouri 65202

This investigation will develop techniques for use of the seismograph in limestone-derived soil areas. The soils have variable contents of chert and the soil depth to carbonate rock is variable over short horizontal distances. The seismic determination of depth to carbonate rock may be complex because of the stated variations. However, the measurement is needed for determination of the volume of soil that can perform the functions of intercepting rainfall, retaining that water and then subsequently releasing it to growing plant canopies. The volume of soil will be used to calculate volumes of plant-available water storage.

2.0700, SEASONAL SHALLOW STORAGE AND DEEP SEEPAGE COMPONENTS FOR THE HYDROLOGIC BUDGET OF A SMALL FORESTED OZARK WATERSHED

C.D. SETTERGREN, Univ. of Missouri, Graduate School, Columbia, Missouri 65202

The proposed research is directed at ascertaining the magnitude and direction of water movement and fluctuations in storage in the soil and unconsolidated geologic residuum above bedrock in response to seasonal differences in precipitation supply and evapotranspiration demand on a small forested watershed in the Ozarks.

The following investigations will be carried out on a gaged, fully-instrumented watershed: 1. An initial geophysical inventory will be made with portable seismological equipment to determine the total residuum storage characteristics. 2. A network of neutron soil moisture and density sampling tubes will be installed to inventory periodic fluctuations in water movement in the soil and residuum. 3. Seasonal changes in moisture at varying depths will be correlated with precipitation, runoff, and estimated evapotranspiration.

2.0701, MISSOURI SPRINGFLOW CHARACTERISTICS

A. HOMYK, U.S. Dept. of Interior, Geological Survey, Rolla, Missouri

This research is part of the program of water resources investigations conducted by the U.S. Geol. Survey in cooperation with the State of Missouri.

Purpose - To determine hydrologic characteristics of principal springs in Missouri, their water-supply potential and relations to streamflow and aquifer systems.

Methods - Continuous records will be collected at selected springs that are representative of various geologic and hydrologic environments. Periodic measurements will be made of additional springs and correlations will be made with continuous record network for determination of long-term spring behavior. Relationships between spring discharge and aquifers will be studied, as will relationships between spring discharge and streamflow. Changes in chemical quality of spring water and geology of spring areas will be studied and correlation of spring discharge with topography and sink hole and cave development will be made.

2.0702, HYDROLOGIC AND PHOTOGEOLOGIC DETERMINATION OF RAINFALL, RUNOFF, AND GROUNDWATER RELATIONSHIPS IN A DOLOMITE AREA

V.A. GEVECKER, Univ. of Missouri, Water Resources Research Ctr., Rolla, Missouri 65401

The objective of this interdisciplinary investigation is to develop procedures for quantitative evaluation of relationships between rainfall, runoff, and groundwater in a dolomite area. The study is to be conducted on an 18 square mile area which has a 12-gage raingage network and adequate stream gaging facilities. Two or more years of records are available. Collection of data will be continued during the period of investigation.

The planned objectives are: (a) to analyze existing daily rainfall records to determine intensity, duration, and distribution of individual storms and total amounts of precipitation; (b) to determine effects of local physiography on distribution of rainfall and compare magnitude and frequency of storms to those reported by U.S. Weather Bureau network; (c) to determine the amount and predictability of evaporation from the project area; (d) to analyze existing streamflow records and compare these with various estimation methods; (e) to apply aerial photo interpretation methods to identify characteristics which affect runoff and groundwater; (f) to measure infiltration capacities of area dominant soils; and (g) to evaluate the magnitude of evaporation and other losses from the area.

2.0703, SPATIAL BEHAVIOR OF ROUGHNESS IN LABORATORY WATERSHED, PHASE II

T.E. HARBAUGH, Univ. of Missouri, Water Resources Research Ctr., Rolla, Missouri 65401

2. WATER CYCLE

A study is proposed to investigate the variations in flow resistance, i.e., roughness, resulting from differing raindrop size and raindrop impact velocities, of the flow surface of a laboratory test surface.

It is the purpose of this project to (a) vary raindrop impact velocities from 0 to 20 feet per second, and (b) use three different size simulated raindrops in various simulated rainfall intensity experiments conducted on a 2' by 10' adjustable slope testing surface. It is anticipated that results from this investigation will present a basic understanding of the role which roughness plays in watershed and overland flow modeling attempts.

Application of modeling techniques to watershed studies, is an essential supporting study to applied problems in Water Resources. Use of a physical laboratory watershed model would be a more versatile approach if the response of the model could be changed in a predictable manner. It is anticipated that this study, Phase II, will aid materially in an improved understanding of the behavior of flow resistance in watershed models subjected to simulated rainfall.

2.0704, DRILLED WELL INVESTIGATION OF DOLOMITE AQUIFER CHARACTERISTICS **J.C. MAXWELL**, Univ. of Missouri, Water Resources Research Ctr., Rolla, Missouri 65401

Aquifers of cherty dolomite and limestone, of Paleozoic age, are the principal source of groundwater throughout at least 30 percent of the area of the central and mid-western United States. Although approximate depth to water and present yield are known for many individual wells, there is no quantitative information available for estimating transmissibility, storage capacity, or potential reservoir capability of the dolomite rocks.

This investigation consists of drilling three sets each of three to five test and observation wells. The wells will be drilled to the first waterbearing zone. Then measurements will be made of piezometric levels, aquifer transmissibility, storage capacity, undisturbed gradient, and flow rates. Upon completion of each set of tests, and within budgetary and time limits, the wells will be drilled to successively deeper waterbearing zones and retested. The area of investigation is Crawford, Dent and Phelps Counties, Missouri, or roughly a southeast quadrant from the City of Rolla.

2.0705, HYDROLOGY OF HUNGRY HORSE RESERVOIR, MONTANA **M.I. RORABAUGH**, U.S. Dept. of Interior, Water Resources Division, Saint Louis, Missouri

Hungry Horse Reservoir, one of the major Federal multipurpose components of the water development program for the Columbia River, is used primarily for at site and downstream power generation and flood control. Since its completion in 1951, operation has revealed the need for determining more accurately the volume of water, including bank storage, available for power production and for developing an operational forecasting procedure for the lowflow season.

Objectives are to define hydrologic parameters related to reservoir management and power production; to more accurately determine volume of water available at Hungry Horse Reservoir; and to improve forecasting procedures.

It is proposed to collect additional data on surface inflow and outflow, subsurface inflow and evaporation from reservoir surface. This would include the establishment of: a permanent inflow station on South Fork Flathead River just above reservoir flow line; reestablishing temporary gages on two tributaries, establishing temporary gages on four additional tributaries; making miscellaneous measurements at about 20 additional locations; and additional measurements on the main outflow gage below the dam. Evaporation from the reservoir surface would be determined by an energy budget procedure.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0706, SOLUTE AND WATER TRANSPORT ACROSS BIOLOGIC MEMBRANES **N.S. BRICKER**, Washington University, School of Medicine, Saint Louis, Missouri 63130

We propose to continue studies relating to the nature of salt and water movements across membranes of living cells. Specific interest will be directed towards the biophysical mechanisms and the energetics of active transport across polar epithelial cells that are specialized in transcellular salt (and water) movements. Studies also will be performed on transport by red blood cells of the squalus acanthias (dogfish shark). The internal ionic environment of cells of this marine species is unique to elasmobranchs and special problems in maintaining intracellular composition are of considerable interest.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

2.0707, COMPUTER SIMULATION OF THE HYDROLOGIC SYSTEM OF A MOUNTAIN WATERSHED **D.E. DUNN**, Montana State University, Graduate School, Bozeman, Montana 59715

The proposed work is an attempt to simulate the hydrologic system of a small mountain watershed using digital computer techniques. Both surface and subsurface portions of the system will be included in the synthesis. Parameters in the model will be related to physical characteristics of the system. Initial estimates of the parameters will be based on field observation, and then the parameter values will be improved by trial and error matching of computer and prototype stream-flow rate outputs.

Montana State University

2.0708, INFLUENCE OF SPECIFIC IONS ON GROWTH PATTERN OF PLANTS **E.O. SKOGLEY**, Montana State University, Agricultural Experiment Sta., Bozeman, Montana 59715

1. To study the influence of nutrient or salt ions on moisture efficiency.

2. To investigate the relative influence of specific ions on the growth pattern and water utilization characteristics of plants.

3. To determine the influence of nutrient or salt ions on physiological and/or anatomical responses related to growth and transpiration.

Description of Work: Selected crop plants will be grown in synthetic ion-exchange media prepared to support plant growth. A specific ion can be varied in amount in this medium without the concurrent variation of other ions in the system. Growth and development of the plants will be measured and the water use by transpiration under various conditions will be monitored. The relative turgidity of the plant leaf tissue will be used as an index to the water condition within the plant. Plant composition data will be gathered as required. Root permeability measurements and physiological studies may be used to help elucidate the mechanisms involved.

Montana State Government

2.0709, MOUNTAIN PRECIPITATION AND DISTRIBUTION **A. SUPER**, Montana State University, Graduate School, Bozeman, Montana 59715

This research project has as its major objective the acquisition of a continuum of information about Montana alpine snowpacks from autumn origin through winter accumulation to spring wastage. The snowpack is of basic importance in all considerations of water supply. There is also a growing importance in relation to recreational use and safety.

Instrumentation has been installed in the Bridger Research Area. Part of this instrumentation is included in an automated

2. WATER CYCLE

data collection system from which data are transmitted by telemetry to the Computer Center on the Montana State University campus. The resistograph, invented by Dr. Charles C. Bradley of Montana State University, is an important scientific instrument in this research.

Investigations of the accumulation, metamorphism, and wastage of mountain snowpacks will be continued and expanded. Particular attention is being given to the climate near the ground as determined by such descriptive parameters of terrain as slope inclination, elevation and slope orientation. The transfers of radiation and latent and sensible heat through the snow-air interface and the factors contributing to snow settlement and snow creep are also being studied.

Montana State University

2.0710, DRAINAGE CORRELATION RESEARCH PROJECT

T.T. WILLIAMS, Montana State University, School of Engineering, Bozeman, Montana 59715

There is a shortage of a reliable information regarding flood flow frequencies and magnitudes from small (1 to 100 sq miles) drainage areas in Montana. This study is intended to augment the 'Small-Area Peak-Flow Program' being conducted in Montana by the U. S. Geological Survey, under which peak flow data are being collected by crest-stage gages at over 200 watersheds.

The present study is two-phase: A. Precipitation and other climatological data are being analyzed to determine whether a correlation exists between these data and the crest-stage peak flow data being gathered by the USGS. B. An intensive field study of four watersheds is in progress, with data being collected for a six-year period, on a continuous basis. Precipitation and other climatological data, together with stream flow data, are being obtained and will be analyzed by a variety of hydrologic techniques, including the unit hydrograph method.

2.0713, GRAVITY INVESTIGATION OF WATER-BEARING STRATA IN SWAN VALLEY, MONTANA

G.W. CROSBY, Univ. of Montana, Graduate School, Missoula, Montana 59801

Purposes of the gravity investigation in the Swan Valley, northwestern Montana, are to determine the thickness and configuration of Tertiary and Quaternary water-bearing strata, and to infer their approximate water-bearing capacity, i.e., porosity, from gravitational measurements of bulk density.

Swan Valley is one of many intermontane valleys in western Montana created by Tertiary block faulting. Displacement on the faults, and thickness of valley fill, is generally measured in thousands of feet. Previous gravity investigations in the Basin and Range Province indicate density of the valley fill is about 2.2 grams per cubic centimeter. This density value is in contrast to a value of approximately 2.67 for the Belt rocks exposed in the Swan and Mission Ranges bounding the valley on the east and west sides respectively. Variation in gravity as a result of this large density contrast should readily express position of boundary faults and permit a model computation of the configuration of the valley sediments. Gravity base stations, looped with the absolute gravity base at Missoula airport, have already been established in the valley. Samples of Belt rocks have been collected for laboratory density measurements. Approximately 400 gravity stations will be occupied in the Swan Valley and tied to the base stations, mostly during the 1967 field season. Field data will be processed by computer and mathematical models computed to determine best fit with observed gravity. Results are to be published in a professional journal.

Ground water resources in the Swan Valley will be utilized by industrial, agricultural and recreational facilities in the valley, and, as the need arises, water may be diverted to the more industrialized Flathead and Missoula Valleys which have natural drainages from Swan Valley.

2.0716, THE DETERMINATION OF PLANT ROOTING AND WATER ABSORPTION PATTERNS WITH RADIOIODINE

T.J. NIMLOS, Univ. of Montana, Graduate School, Missoula, Montana 59801

Rooting patterns and water absorption by understory plants common to the forests of the Northern Rocky Mountains will be determined by injecting radioactive iodine (I-131) into the soil at various depths and measuring the presence of the isotope in the above ground portion of the plant. This study is a continuation of work already in progress and will be conducted on sites at which other environmental and biotic data are being collected. The site to be investigated in the first year is stone-free, which will permit perfecting the techniques used in 1965. The techniques developed at this site will be applied to a stony soil during the second year of the investigation.

These data will be related to soil moisture depletion curves as determined by gravimetric analysis. Rooting patterns have been studied at one site and the patterns obtained on other sites will be compared to the data from the first site.

2.0721, ENERGY SOURCES FOR EVAPOTRANSPIRATION IN THE PLAINS REGION

N.J. ROSENBERG, State Water Resour. Res. Inst., Lincoln, Nebraska

Two weighing lysimeters of the type described by Van Bavel and Myers (Agr. Eng. 43:580-583, 586-588, 1962) will be constructed and filled with soil to a normal bulk density. The lysimeters will be placed within a field uniformly leveled for frequent and precise application of irrigation water. The field will be large enough to insure adequate fetch for representative aerodynamic conditions in the area of the lysimeters.

Meteorological parameters as wind movement, total hemispherical and net radiation, soil thermal flux, air and soil temperatures and atmospheric humidity will be monitored during periods of evaporative and transpiration loss of water from the lysimeters. The relative contribution of radiative and advected energy to the evapotranspirational demand created will be studied. Relationships to predict evaporation and transpiration from well watered soil based upon meteorological conditions will be developed.

Means of modifying evapotranspirational flux will be tested. These will include wind shelter, anti-transpirant and evaporation suppressant chemicals and plastic and vegetative mulches.

The work will be performed at the University of Nebraska Field Laboratory at Mead, Nebraska.

The project was first funded in Fiscal 1965. Equipment will be operational by the end of Fiscal 1966. It is anticipated that the first studies described above will be completed by the end of Fiscal 1969 but that the facilities established will continue in use beyond that time.

2.0722, INTERNAL WATER STATUS OF PLANTS

E.J. KINBACHER, Univ. of Nebraska, School of Agriculture, Lincoln, Nebraska 68508

Instrumentation available to monitor the status of internal plant water leaves much to be desired. Improved instrumentation is of interest in order that the influence of various degrees of moisture stress on rate levels of key physiologic processes might be studied more adequately. Currently a project is underway to adapt microwave refractometry to the measurement of internal plant water status. Water vapor pressure in air equilibrated with internal plant water is of interest. Dielectric constant measurements of air in equilibration chambers are being attempted. As instrument construction is completed this project will involve a comparison of the new method with other methods for characterizing internal plant water status such as the Beta gauging, relative turgidity procedures, electrical conductivity, and some of the old and new diffusion pressure deficit procedures.

2.0723, DETACHABILITY OF SOIL PARTICLES

A.P. MAZURAK, Univ. of Nebraska, Agricultural Experiment Sta., Lincoln, Nebraska 68508

Objectives: 1. To determine the effect of raindrops on the detachability of soil particles in the principal soil groups in Nebraska. 2. To determine the physical and chemical properties

2. WATER CYCLE

of soil associated with detachability of soil particles. 3. To evaluate the effects of soil and land use management practices on detachability of soil particles.

Principal bench-mark soils in Nebraska will be studied. The range of soils selected for the study will be determined from the K-values (0.49 to 0.10) in the universal erosion equation. Soil surfaces will be exposed to simulated uniform raindrops in a 3-story rainshaft. The amount of soil detached in a 30-minute storm will be measured. Chemical and physical properties of soil associated with the detachment of soil particles will be measured and related to the K-values in the erosion equation.

Field studies will be related to the laboratory study. Five sampling periods of the field conditions during the year will be taken. Soil samples will represent disturbed and non-disturbed conditions. Effect of mulches and vegetative canopy on detachability of soil particles will be determined.

2.0724, AGROCLIMATIC PARAMETERS

R.E. NEILD, Univ. of Nebraska, Agricultural Experiment Sta., Lincoln, Nebraska 68508

Objectives: (1) To determine climatic adaptability and length of growing and harvest season for a series of vegetable crops in Nebraska. (2) To evaluate the effects of climatic events on yield and quality of vegetables within their respective growing seasons. (3) To define and apply probability estimates to the climate of Nebraska in terms of its current and future effects on agricultural operations.

Procedure: (1) Most favorable dates for planting and harvest will be determined by comparative climatology for those crops found to be adaptable to the region. (2) Yield, quality and phenological measurements of selected vegetables at different locations will be analyzed in relation to climate and season. (3) Climatological data will be processed electronically with particular attention to agroclimatic parameters and the growth season.

2.0726, A LEGAL-ECONOMIC ANALYSIS OF ADMINISTRATIVE AND MARKET PROCEDURES USED IN THE TRANSFER OF WATER RIGHTS

C. YEUTTER, Univ. of Nebraska, School of Agriculture, Lincoln, Nebraska 68508

This study will analyze and evaluate, both from a legal and from an economic standpoint, the varying means by which water is now being allocated in the United States. Specific objectives include: 1) Determining the degree to which efficiency criteria are being applied by both courts and administrative agencies. 2) Determining the extent to which market forces are permitted and encouraged to function and the extent to which equi-marginal principles are evident in such markets. 3) Determining whether state statutes are impeding water development because of rigidities and inflexibility.

The investigation will: (a) Appraise the allocation of water in Nebraska in terms of conformance with an economic model to be devised. (b) Determine the effectiveness of water law administration in Nebraska and other selected states with dissimilar legal systems. (c) Develop methods and techniques for electronic retrieval of water law, state and federal.

2.0727, MAXIMUM PRODUCTION OF CROPS UNDER IRRIGATION IN WESTERN NEBRASKA

L. HARRIS, Univ. of Nebraska, Agricultural Experiment Sta., Mitchell, Nebraska

Objectives: A study to determine maximum production of crops under irrigation in Western Nebraska.

Description: The maximum production and best judgement rotations were established on the level basins in Field K. Bulk soil samples were taken for chemical and other analyses. Undisturbed soil cores were taken for moisture release and determinations. Differential fertilizer and irrigation practices were initiated. Yields of crops were excellent except in some areas where soil compaction by construction machinery appears to have impeded root penetration. Installation of the underground irrigation pipeline was completed on July 10.

SUPPORTED BY Nebraska State Government

2.0728, WATER REQUIREMENTS OF MAJOR CROPS IN SOUTHERN NEVADA

R.K. PETERSEN, Univ. of Nevada, Agricultural Experiment Sta., Logandale, Nevada

Objectives: 1. To determine peak and seasonal water use by the more important crops grown in Southern Nevada. These requirements will be obtained for crops grown during the cool season as well as for those grown in the hot season. 2. To compare above results with various empirical relationships between climate and water use (Thornthwaite, Penman, Blaney-Criddle, etc.). 3. To determine leaching requirements for keeping salt out of the root zone.

Description of work proposed: Plots containing some of the more important crops to Southern Nevada will be established and maintained under optimum soil moisture conditions, as well as under irrigation practices common to the area. Different methods will be used to obtain periodic soil moisture readings to determine peak and seasonal water use. Soil samples will also be taken periodically to determine any possible build-up in salts. If need arises, leaching requirements will be studied under different irrigation practices.

Nevada State Government

2.0729, MOVEMENT OF WATER AND AIR TO AND INTO PLANT ROOTS IN SOILS OF THE GREAT BASIN

W.F. SPENCER, U.S. Dept. of Agriculture, Reno, Nevada

Objective: To measure the oxygen diffusion rate and other physical and chemical properties of problem soils of the Great Basin and relate these factors to crop response. To devise physical and/or chemical treatments to improve soil physical condition, soil water movement, and crop yield.

Plan of Work: Continue development and testing of instrumentation for measuring oxygen diffusion rate in soils in the laboratory under a variety of moisture contents, salinity levels, and other variables, such as soil texture, and volume weight. Measure oxygen diffusion rate, soil water movement, and related physical and chemical properties in laboratory soil samples and field plots. Correlate results with crop response.

Cooperation: Agricultural Experiment Stations, SCS, U. S. Bureau of Reclamation, State Engineers, State Water Resources Agencies, and other irrigation, water management, or soil conservation district agencies.

2.0731, NORTH SIERRA OROGRAPHIC, CONVECTIVE CLOUD STUDY - ATMOSPHERIC WATER RESOURCES PROGRAM

W.A. MORDY, Univ. of Nevada, Desert Research Institute, Reno, Nevada 89507

To make a study of the physics and dynamics of orographic and convective cloud systems of the Humboldt River and Lake Tahoe drainage basins of Nevada. Also, lee wave lenticular clouds of supercooled droplets are being studied. Precipitation from these clouds frequently does not occur naturally due, in part, to short transit time through the clouds. Using instrumented aircraft and radar, nuclei and drop spectors will be studied with and without seeding to test the modification of the precipitation processes.

Theoretical studies of cloud physics to actual weather modification research, and the development of instrumentation and data acquisition systems will be made. Special emphasis will be given to the development of a data acquisition system which will coordinate radars, instrumented aircraft, balloon probes and telemetered ground networks to provide real-time display of meteorological and hydrological data. Applied Research 100 percent.

2.0733, EFFICIENT ESTABLISHMENT AND PRODUCTION OF FORAGE CROPS ON IRRIGATED LANDS

J. OLDHAM, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

Objectives: 1, to determine the effects of row spacing of legume-grass mixtures and fertility levels on ease of establishment, yield; botanical and chemical compositions of forages; 2, to compare methods of irrigation during establishment in relation to soil properties; 3, to evaluate methods of establishing winter annuals in Bermudagrass sod and achieving maximum yearly production of forage.

Procedure: Grasses and legumes will be seeded in a mixture, in alternate rows and with two rows of grass and one of legume. Fertilizer involving variables in P, K and N will be evaluated. Forage yield and botanical composition of all treatments will be determined. Consumptive use of water will be calculated from neutron probe and water application data.

A number of forage species seeded in a saline-sodic soil will be irrigated by flood and sprinkler irrigation during establishment. Records of amounts and dates of water application will be kept. Number of plants established and forage yields will be determined. Winter annual legumes and grasses will be seeded at different dates in Bermudagrass sod that has been mowed, mowed plus scarification, or mowed plus paraquat. Fertilizer variable will be included, yield and composition of the forage will be determined.

2.0734, DISSOLVED CONSTITUENTS OF NATURAL WATERS - CONTRIBUTIONS FROM MINERALIZED AREAS

J.V. SHARP, Univ. of Nevada, Water Resources Research Ctr., Reno, Nevada 89507

Geologic terranes where ore metals and substances occur in abundance relative to usual occurrence are possible sources of unusually high concentrations of trace constituents and certain gross constituents in natural waters. These constituents may be harmful for human consumption or for agricultural or industrial use. Ground and surface waters will be sampled from selected mineralized areas and analyzed for gross and trace constituents. Spatial and temporal occurrence of dissolved constituents will be related to sources in mineralized rock, thermal waters, and mine and mill disposals. Transport of constituents will be interpreted in light of hydrodynamic and geochemical characteristics of flow systems. Results will be related to water uses in the areas investigated, particularly situations where deleterious constituents may be a limiting factor on water use. Information and generalizations will be extended to other mineralized localities in the western United States.

2.0737, THE WATER RELATIONS OF DESERT PLANTS

N.M. STARK, Univ. of Nevada, Desert Research Institute, Reno, Nevada 89507

The proposed research plan will complete work on the water relations of desert plants which is already in progress. The study is investigating the sources of water available to desert plants including soil moisture, and soil and atmospheric humidity. The influence of water available in the field is followed by comparing the changes in osmotic pressure, percent moisture, and relative turgidity of plant parts. Fluorescent dyes and tritiated water are being used to determine if water from various sources is able to

2. WATER CYCLE

enter the plant tissues. Water up-take is compared to water loss from transpiration which is correlated with seasonal changes in soil and air moisture, soil and air temperatures, and phenology. The study is projected to continue with monthly sampling for another year to develop a clearer understanding of plant responses at different times of the year. Three common warm desert species are being studied intensively.

2.0740, AN ANALYSIS OF THE VEGETATION AND SOIL CHARACTERISTICS OF RANGE WATERSHEDS IN NEVADA *P.T. TUELLER, Univ. of Nevada, School of Agriculture, Reno, Nevada 89507*

Reconnaissance descriptions of the native plant communities have been completed on 12 range watersheds in Nevada. As part of an ecological resource inventory detailed vegetation descriptions have been completed on 4 of the 12 areas. Soil profile descriptions have also been completed at the vegetation plot locations. An additional 4 areas will be studied in the summer and fall of 1965. Vegetation data has been summarized and analyzed for 3 of the areas. Correlations of vegetative and cover characteristics of native plant communities will be made with important soil characteristics. These data will then be available for correlating with infiltration and runoff data as it is accumulated. Infiltration rates will be determined for the principle soil types starting in the fall of 1965. Work on 12 range watersheds in Nevada is to be completed by the fall of 1968. Runoff water production and precipitation data are being collected as parts of other cooperative studies and by technicians of the Bureau of Land Management.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

2.0741, CLIMATOLOGICAL MEASUREMENTS RELATED TO AGRICULTURE *G.L. BYERS, Univ. of New Hampshire, Agricultural Experiment Sta., Durham, New Hampshire 03824*

OBJECTIVES: (1) To keep reliable records of temperature and precipitation and to forward these regularly to the U. S. Weather Bureau Office. (2) To keep other environmental records as deemed necessary for research projects that are being conducted on the campus and to make these records available to all parties interested in using the data.

DESCRIPTION OF WORK: Readings will be taken daily between the hours of 5:00 p.m. and 6:00 p.m. of maximum and minimum temperature for the previous 24 hours; temperature at

the time of observation and total precipitation (in inches of water) for the previous 24 hours. Particular weather phenomena such as fog, mist, thunderstorms, etc., will be recorded. Daily continuous records of solar radiation - temperature, and atmospheric pressure will be kept. All records will be made available to interested persons.

SUPPORTED BY New Hampshire State Government

2.0742, BASE FLOW ANALYSIS OF SELECTED DRAINAGE BASINS.

F.R. HALL, Univ. of New Hampshire, Agricultural Experiment Sta., Durham, New Hampshire 03824

Objectives: 1. To investigate base flow from a few drainage basins in New Hampshire selected to cover a range in area and geographic location. 2. To derive and test equations that describe the base flow with reasonable accuracy and to assess the physical significance of the terms in the equations.

Description: Drought conditions in New Hampshire have shown the

need for a better knowledge of stream flow during the summer

months. This flow is commonly called base flow and comes mainly

from ground water. One way to investigate the problem is to study

the stream-flow records from selected small drainage basins. The

records will be analyzed by graphical and other techniques, and

equations will be derived to describe the amount and distribution

with time of the base flow from the basins.

SUPPORTED BY U.S. Dept. of Agriculture
New Hampshire State Government

2.0743, CHEMICAL CHARACTER OF GROUND AND SURFACE WATERS IN RELATION TO SOIL WEATHERING PROCESSES

F.R. HALL, Univ. of New Hampshire, Agricultural Experiment Sta., Durham, New Hampshire 03824

Objectives: 1. To determine the chemical character of ground and surface waters with particular attention given to pH, iron, and silica. 2. To investigate the relationship of weathering processes in the soil including mineral cycling by the vegetation and transport of iron, organic matter and silica to the composition of the ground and surface waters.

Under objective 1, samples of water will be collected from the several parts of the system under study including segments of the soil profile, ground water, and surface water. These samples will be characterized chemically with particular attention being given to iron and silica.

Under objective 2, an attempt will be made to identify those organic compounds in the soil and in water which are most closely associated with the movement and deposition of iron. After such compounds have been identified, their mode of action in connection with the weathering of iron-bearing minerals and the movement of iron and silica to surface and ground waters will be studied in both the field and laboratory.

SUPPORTED BY New Hampshire State Government

2.0744, OCCURRENCE AND CHARACTERISTICS OF FRACTURES IN CRYSTALLINE ROCKS OF SOUTHEASTERN NEW HAMPSHIRE AND THEIR RELATIONSHIP TO THE YIELD OF DRILL

G.W. STEWART, Univ. of New Hampshire, Graduate School, Durham, New Hampshire 03824

The goal of this research is to map the fracture systems in the crystalline (igneous and metamorphic) rocks of southeastern New Hampshire and attempt to ascertain how the yield of the drilled water wells and the fracture systems are related.

2. WATER CYCLE

The field work will consist of an examination of the available outcrops. A record of the fracture systems will be prepared as well as other related structural features in the outcrops. The field data will be plotted on base maps and local and regional syntheses will be made to aid in an evaluation of potential water supplies.

Southeastern New Hampshire is growing very rapidly and the domestic use of ground water has increased because the cities and towns have not been able to expand their water systems to all areas of development. Any techniques developed by this investigation might be useful not only to this area but to other parts of New Hampshire underlain by crystalline rocks.

University of New Hampshire

2.0745, HYDROLOGIC-MINERAL CYCLE INTERACTION IN SMALL UNDISTURBED AND MAN-MANIPULATED ECO-SYSTEMS

G. LIKENS, Dartmouth College, Graduate School, Hanover, New Hampshire 03755

This is a renewal of GB-4169 for continued work in the Hubbard Brook Experimental Forest in New Hampshire. The investigators have been successful in developing an input-output-budget approach to the hydrologic cycle and to the movement of several elements through a watershed. The influence of vegetation cover on both runoff and cycles of elements has been strikingly demonstrated. The investigators now are expanding the work to include consideration of more aspects of the system through the enlistment of the cooperation of seven additional scientists. Continuing work includes studies of both undisturbed watersheds and others that have been modified by cutting, herbicides, and pesticides.

SUPPORTED BY U.S. National Science Foundation

2.0746, DETERMINATION OF THE STAGES OF EUTROPHICATION OF SOME OF NEW HAMPSHIRE'S LARGE LAKES PHASE II

P.J. SAWYER, Dartmouth College, Graduate School, Hanover, New Hampshire 03755

The determination of the stages of eutrophication has been carried out on only one of New Hampshire's lakes, it is proposed to extend this knowledge. Five lakes will be investigated, one of them in two different places. Attempts will be made to gather information on the chemical, physical, and biological characteristics of the lake. The chemical characteristics to be determined will be oxygen, carbon dioxide, alkalinity, phosphates, nitrates, and possibly some ionic determination by atomic spectroscopy. Physical characteristics to be identified will be pH, light penetration, temperature stratification, and conductivity. Finally, primary productivity will be measured by the carbon-14 technique, and the zooplankton and phytoplankton components will be identified. Additional work will be done on the impact of copper sulfate on lake communities.

2.0747, SNOW AND ICE COVER INVESTIGATIONS

M.A. BILELLO, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

Regional variations of snow cover properties; the formation, growth and decay of lake, rivers, and sea ice and the rate of thaw of seasonal frost in the Arctic and Subarctic are being studied. Seasonal and areal distribution of these conditions to develop forecast schemes for prediction of the time of occurrence are being studied also. Data are acquired through a cooperative program between USA TSC and the following agencies: Weather Bureau, U.S. Soil Conservation Service, U.S. Geological Survey, U.S. Air Force, and Canadian Department of Transport.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0748, FROZEN GROUND INVESTIGATIONS, BARROW, ALASKA

J. BROWN, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

An integrated program combining soils, surficial geology, and stratigraphy, vegetation and hydrology was initiated in 1962 to characteristic soil and near-surface processes operating in a coastal arctic environment (71 degree 19'N, 156 degree 35'W). Related hydrologic research includes: (1) A continuing hydrology study on a small watershed in which rainfall, runoff, evaporation, and various chemical and soil parameters are determined (data period summers 1963- 1966); (2) Depth of seasonal soil thaw (1962-1966); (3) Ice content of perennially frozen ground including massive ice wedge ice. Findings are related to present and past climates. Chemical gradients in soils and near-surface sediments are determined in order to approximate formational processes.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0749, HYDROLOGIC STUDY OF A SMALL ALASKAN WATERSHED

S.L. DINGMAN, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

A forested watershed of Glenn Creek, 8 miles north of Fairbanks, Alaska, is being studied. The vegetation and topography are typical of the Yukon-Tanana Uplands. Runoff through a V-notch weir, precipitation, air and water temperatures, humidity and incoming solar radiation will be recorded from break-up to freeze-up. Periodic water samples for dissolved and suspended solids are taken. A snow survey course provides snowpack information.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0750, CONTROL AND PREVENTION OF CULVERT AND ROAD ICINGS

R.W. HUCK, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

The purpose of this cooperative study, begun in FY 1967, is to develop new and improved existing methods for the prevention and control of culvert and road icings, with the initial effort focused on the problem of culvert icings. The scope of this study includes: (1) a literature survey; (2) field reconnaissance of icing problem areas; (3) investigation of several typical icing problem areas, considering topography, surficial geology, hydrology, and meteorology; and (4) field testing new techniques for icing control and prevention.

A literature survey has been completed, resulting in an annotated bibliography. Icing problems have been studied along 800 miles of Alaska's highways. Analysis of meteorological and culvert temperature data from three instrumented icing sites near Fairbanks has been performed, covering the 1966-67 and 1967-68 winters. Hydrologic data acquisition has added to the field program at these sites for the 1967-68 winter. At one site, controlled testing of electrical heating techniques was performed during the 1967-68 winter.

Three full-scale field tests will be conducted during the 1968-69 winter. These include channel covers to reduce radiative and connective heat losses, electric heating cables to keep the channel open and a channel improvement to carry potential icing down stream of a bridge.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0751, FROST SUSCEPTIBILITY CRITERIA

C.W. KAPLAR, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

The purpose of this investigation is (1) to further study and evaluate those factors that cause a soil to be frost susceptible and (2) to develop rapid and more precise frost susceptibility criteria and indicators. The study will be performed principally in the laboratory.

2. WATER CYCLE

Review and analysis of available literature will be made to take advantage of any new research or demonstrable theories on frost action phenomenon in soils. Previously collected in-house data will be reviewed in the light of newer knowledge and information.

Laboratory effort initially will be concentrated on developing a simpler and more rapid freezing test. The simpler, more rapid freezing technique, if developed and proved effective, will be used as a principal tool in the ensuing studies in this project. Efforts will then proceed to formulation and investigation of hypotheses as indicated under paragraph 2, 'Procedure,' of the basic Instructions and Outline

SUPPORTED BY U.S. Dept. of Defense - Army

2.0752, GROUND WATER PREDICTION STUDIES

C.W. KAPLAR, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

The purpose of this project will be to study methods of predicting or estimating ground-water conditions in the upper soil strata and availability of moisture for ice segregation during freezing.

Field observations of climatic, meteorological and ground moisture conditions will be made at 2 or 3 sites in the northern United States over a period of a few years to study methods of predicting soil moisture conditions and probable ice segregation and heaving. Methods of evaluating climatic and other factors for estimating probable field moisture conditions will be studied. Field moisture conditions just prior to and during freezing will be correlated with heave characteristics of various soils. Simplified method(s) will be developed for predicting or estimating soil moisture and possible ice segregation in soils, for use as a design tool.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0753, MOUNTAIN RESEARCH

C.C. LANGWAY, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

TECHNICAL OBJECTIVE - To study the environment of a high mountain with particular reference the distribution and properties of snow. Emphasis is placed on snow as frozen precipitation which accounts for large changes in storage in these glacierized drainage basins.

APPROACH - Measure the distribution of precipitation with elevation on a large, high mountain by sampling through the previous year's snow accumulation. Measure as many of the related climatological parameters as possible.

PROGRESS - A traverse from 3300 to 5500 meters was made on Mt. Logan, Yukon Territory, Canada. Mean annual accumulation was measured at 300 meter vertical intervals. Mean annual temperatures were estimated from the 10 meter deep snow temperatures. Two automatic recording weather stations were set up to measure winter temperatures and air pressures in order to correlate with upper air soundings from Yakutat, Alaska and Whitehorse, Canada.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0754, DEEP ICE CORE STUDIES AND ANALYSES FROM GREENLAND AND ANTARCTICA

C.C. LANGWAY, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

For the FY 68 period, plans are to study the ionic stable and radioactive isotope concentrations and their variations, and also the variations in composition of the atmospheric precipitation and gases contained in the occluded air bubbles. A study will be made of microscopic dust looking for historically datable horizons such as the 1883 Krakatoa and the 1912 Mt. Katmai eruptions and will provide data on such things as the transporting power of stratospheric and tropospheric winds. Additional studies will be conducted on the extraterrestrial constituents of glaciers. This project was started in 1957. It has branched into more geochemical analyses as indicated.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0755, TEST OF EFFECTIVE SOILS PROPERTIES IN THE ANNUAL FROST ZONE

E.F. LOBACZ, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

The purpose of this investigation is to develop a basic mathematical theory relative to the thaw-consolidation problems in soils and to determine effective values of, and relationships between, permeability, thermal conductivity, percentage of freezable soil moisture, etc., undisturbed soil subject to freeze-thaw cycles.

These studies will include a review and analysis of available literature and data, laboratory cold room studies, hydraulic and of electronic computer investigations, and field studies as necessary to verify theoretical concepts.

This project was to be initiated in FY 69 with a scheduled completion date of 30 June 1972. However, unavailability of funds has resulted in postponement of the project start to a future date.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0756, UTILITIES IN PERMAFROST AREAS

S.C. REED, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

It is the purpose of this study to develop design and construction criteria for utility systems in cold regions to satisfy requirements for water conservation and pollution control. The study includes water supply, waste water treatment and fluid transmission systems. Work in progress includes: (1) Intensive performance study of utility pipe system and prototype extended aeration waste water treatment plant installed at the USA CRREL Alaska Field Station in Fairbanks, Alaska. This work is a cooperative effort with the State of Alaska Department of Health and Welfare. (2) A study to develop design and operational criteria for water supply and waste water disposal facilities for permanent and semi-permanent stations on the ice caps of Greenland and Antarctica. Future work will include: Observation of community utility systems in permafrost areas, and an extension of present programs with increasing emphasis on water supply problems.

2.0757, COLD REGIONS PHYSICAL SCIENCE

Y.C. YEN, U.S. Army, Terrestrial Sciences Center, Hanover, New Hampshire 03755

TECHNICAL OBJECTIVE: To obtain information on particle physics, wave propagation and lower atmospheric conditions.

APPROACH: Research is being conducted at the desk, in the controlled conditions of the laboratory and in the field.

PROGRESS: Electron microscopy work on snow, ice crystals and ice fog crystals as well as fog dispersal studies, effects of thermal instability on ice melting, propagation of radiation in visible and IR ranges in Arctic fogs. Reports include: Improving Visibility Near Airports During Periods of Fog, USA CRREL Tech. Report 0181 - Fog Dispersal Experiments Using Propane at Walla Walla, Wash., USA CRREL Tech. Report 0198 - Fog Modification Studies on the Greenland Ice Cap, Proceedings of the First National Conference on Weather Modification, pp. 414-422, 1968 - Hexagonal and Cubic Ice at Low Temperature, J. Glaciology, Vol. 7, No. 49, pp. 95-108, 1968 - Microspherules in Snow and Ice-Fog Crystals, J. Geophysical Research, Vol. 71, pp. 3397-3404, 1966 - Electron Microscope Study of Ice-Fog and Ice Crystal Nuclei in Alaska, J. Meteor. Soc. Japan, Ser. II, Vol. 44, pp. 185-194, 1966.

2.0758, SOIL-PLANT-WATER RELATIONSHIPS

R.B. ALDERFER, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

1) To study the energy status and dynamics of water in soils and plants. 2) To determine the influence of plant and environ-

2. WATER CYCLE

mental variables upon water extraction from the soil profile. 3) To relate physiological conditions in plants to water stress.

The New Jersey Station will measure the water use rates of plants and the possible contribution of lateral and upward movement of water to the supply of available water in the root zone of the soil. Plastic barriers will be placed on the soil surface to control evaporation losses and additions of water from rainfall. Plastic barriers will also be installed around and/or below 6x3 1/2x 10 foot blocks of soil to control water movement into or out of the block, and confine root development of the crop plants grown in this volume of soil.

New Jersey will study the effects of various combinations of stress on the growth of plants. Yield and quality of harvested plant parts and depletion of available water from the soil occupied by different parts of the root system will be measured in field and greenhouse experiments.

2.0759, USE OF WATER BY LOWLAND VEGETATION IN NEW JERSEY COASTAL PINE REGION

M.F. BUELL, Rutgers The State University, Graduate School, New Brunswick, New Jersey 08903

The proposed research involves the measurement of evapotranspiration by units of lowland vegetation. The units of vegetation (1) shrubs, (2) small breadloaf trees, (3) small cedar trees, are placed in tanks in sites and prevailing normal water level maintained. Rainfall records kept at site. Record of pumping necessary to maintain the level in tanks used as record of evapotranspiration. What is relative use of water by these three types of widespread lowland vegetation and may the results suggest desirability of management of lowland vegetation for increased water yield?

2.0760, INFLUENCE OF SOIL MOISTURE AND SOIL FERTILITY LEVELS ON ASPARAGUS YIELD AND QUALITY

R.L. FLANNERY, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

(1) To determine the influence of three soil moisture and three soil fertility levels and their interactions on yield and quality of asparagus grown on Coastal Plain soils.

Moisture levels to be studied: Low, medium and high moisture levels to be maintained by differential irrigation during: (a) cutting season only, (b) brush growing season only, and (c) during both cutting and brush growing season. Soil fertility levels to be studied: Use of one-half of N-P2O5-K2O per acre recommended according to soil tests; use of normal N-P2O5-K2O per acre recommended according to soil tests; and use of two times the N-P2O5-K2O per acre recommended according to soil tests.

2.0762, APPLICATION OF CLIMATOLOGY TO NEW JERSEY AGRICULTURE

A.V. HAVENS, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

Objectives: To assemble and analyze the climatological data of the Northeast that apply to agriculture; to determine, using phenological measurements, the response of selected plant species to environment; to conclude the present studies of the influence of climatic variables on plant response. Description: An important part of Objective I is the continued analysis of weather records and publication of regional bulletins. The Technical Committee plans continued publication of regional bulletins under the series, The Climate of the Northeast. The committee also encourages the individual cooperators to publish additional results separately. Studies currently in progress will be completed under the revised project. The daily weather data now on cards for the 1926-1956 period will be put on magnetic tape, according to procedures agreed upon by the Technical Committee. Stable, long-record weather stations are particularly important for studying climatic trends and extrapolating the data of short-record station. Long record stations have been designated for 60 percent of the Region. Similar stations will be selected in the remainder of the region with the assistance of the Weather Bureau State Climatologist involved. The selections are made on the basis of the period of record and the completeness of the daily weather data. These data will also be put on magnetic tape. Post-1956 data for the regular network stations are being added to the present record. For a complete analysis and coverage of the climate of the northeast, it is necessary that the weather network be complete and include each state in the region.

2.0763, DROUGHT FREQUENCY, INTENSITY & DURATION - ITS CORRELATION TO STREAMFLOW AND ITS IMPACT UPON SYNTHETIC HYDROLOGY

A.V. HAVENS, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

Objectives: To carry out computation of the Palmer Drought Index for long record weather stations in selected watersheds to obtain more complete and reliable data on drought frequency, intensity and duration; to correlate the information obtained from this with streamflow data from selected gaging stations in a chosen watershed. Assuming that sufficiently high correlations between drought index and streamflow will be obtained, it should then be possible to extrapolate our streamflow records backward in time to provide a much longer period of record of information of this kind.

Description of Work Proposed: The data from long record New Jersey climatological stations from selected New Jersey watersheds will be placed on punched-cards. A hydrologic accounting will be computed for entire period of record of these stations and summarized to obtain coefficients of evapotranspiration, recharge, runoff, and loss. From these coefficients, data on the moisture departures, moisture anomaly indices and finally the drought severity index will be computed. The data obtained will be used to compute the frequency of occurrence of droughts of various severities and durations. The same data will be useful for determining the probability of occurrence of the beginning or ending of periods of drought and periods of abnormal wetness. The final drought severity index, (and perhaps some of the intermediate parameters mentioned previously) will be correlated with the streamflow data from the chosen watershed. If the correlations obtained are sufficiently high, regression equations will be computed to predict streamflow. These will be used to extrapolate backward streamflow for period prior to start of flow measurements.

SUPPORTED BY New Jersey State Government

2.0764, THE ECOLOGY OF SELECTED SUBMERSED AQUATIC WEEDS

D.N. RIEMER, Rutgers The State University, Agricultural Experiment Sta., New Brunswick, New Jersey 08903

1) To study the growth and development of Myriophyllum, Potamogeton, and Elodea as affected by (a) chemical, (b) physical, and (c) biological variables. 2) To relate the results obtained to the incidence, distribution, management and control of the above mentioned genera.

2. WATER CYCLE

Myriophyllum, Potamogeton and Elodea will be grown in the laboratory under different levels of water hardness to determine its effect on the growth and development of the plants. Nutrition studies will be initiated in the field in one-tenth acre ponds, where special attention will be given to the effects of sudden large changes in nutrient supply as compared to relatively constant nutrient availability. Laboratory studies will be initiated to determine the effects of photoperiod on germination, shoot growth and development, and flower -ing. Also, laboratory studies will be conducted on the environmental factors, such as temperature, on the germination of seeds.

2.0765, DYNAMIC GROUND-WATER STORAGE

R.J. DEWIEST, Princeton University, School of Engineering, Princeton, New Jersey 08540

This research in unsteady state ground water flow will have the following objectives: a. To investigate analytically the dynamic storage and recovery of underground water. The mathematical tool proposed to investigate time dependent flow in aquifers is Dirac's delta function which is represented in its series of eigenfunctions by integrating the Green's function of the problem in the complex plane. When aquifers are finite, as they are all in nature, the proposed technique offers great advantages over the method of images used by Hantush and Jacob. Moreover, when the aquifer is wedge shaped, the angle of the converging boundaries may assume arbitrary values, unlike those required for the application of the method of images. In particular, the response of the system to sudden changes in required yield will be examined. b. To construct electric R-C analog models: To test the analytical work and to expand the results where analysis becomes unwieldy. c. Field work: A hydrogeologic map will be prepared and aquifer pumping tests made in the field. Part (c), which is an important part of the work, will be supported from state funds and not from NSF funds.

2.0766, FLUVIAL SEDIMENTATION IN STONY BROOK WATERSHED

P.W. ANDERSON, U.S. Dept. of Interior, Water Resources Division, Trenton, New Jersey

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of New Jersey.

The objective is to develop improved technology for measurement of peak runoff from small acres. Peak runoff rates of small watersheds are difficult and often impossible to measure by conventional methods. Use of a pond or small lake to capture and temporarily store most or all of such runoff from a given storm offers a direct volumetric solution. This solution requires that the capacity of the pond at different levels and the outflow, if any, be accurately known. It also requires that the change in level of the pond be observed or recorded frequently during the period of maximum runoff.

A digital-recording water level gage is being evaluated for this purpose. The research includes required frequency of data recording, required accuracy in recording of water levels, a program for processing data through a digital computer and final presentation of results, and a study of the various sources and degrees of error.

2.0767, HYDROLOGY OF CONSOLIDATED ROCK AQUIFERS NEAR PENNINGTON, NEW JERSEY

L.D. CARSWELL, U.S. Dept. of Interior, Water Resources Division, Trenton, New Jersey

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of New Jersey.

Purpose: To determine the effects of small stream impoundments on ground-water recharge; to define the thickness of the zone of fresh- water circulation, and lateral changes in porosity, permeability, and gradients within this zone; and to determine chemical changes in the water as it moves through the zone of fresh-water circulation. To evaluate well-development techniques in wells tapping water filled joints and fractures in consolidated rock.

Methods: Aquifer characteristics are to be determined by a series of pumping tests made before and after filling an impoundment. The local geohydrologic system is to be defined by head measurements of individual aquifers using an inflatable packer. Variations in yield are to be determined throughout the zone of fresh-water circulation by borehole geophysical techniques. Response of the basin to natural- and man-induced changes or events is to be monitored by a gaging station below the impoundment, water-level measurements in wells, and meteorological observations.

2.0768, GEOHYDROLOGY OF THE POTOMAC-RARITAN-MAGOTHY AQUIFER SYSTEM

H.E. GILL, U.S. Dept. of Interior, Water Resources Division, Trenton, New Jersey

This research is part of the program of water resources investigations conducted by the U.S. Geol. Survey in cooperation with the state of New Jersey. The purpose of this project is to aid in our understanding of the geologic, geochemical, and hydrologic controls on ground water in the various aquifers within the Magothy-Raritan Potomac sediments of New Jersey and Pennsylvania. The primary purpose is to determine the mineralogic controls on the chemistry of ground water by evaluating such factors as the clay mineralogy, the gross mineralogy, and flow patterns in order to determine the departure from equilibrium of the water with respect to selected minerals in the aquifer, primarily siderite. In addition to determining the distribution of selected constituents within the natural system, a laboratory study is being made to re-evaluate the stability of natural and synthetic siderite through solubility measurements at 25-30 degrees C.

2.0769, TIDAL DISCHARGE RESEARCH, NEW JERSEY

A.C. LENDO, U.S. Dept. of Interior, Water Resources Division, Trenton, New Jersey

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of New Jersey, the Corps of Engineers, and the Federal Water Pollution Control Administration.

Purpose: To develop and improve techniques for the collection of tidal stage, discharge, quality of water, and sediment data.

Methods: Synchronous records of tidal stage have been collected by digital recorders at estuary stations, computer programs are used to compile these records. Discharge equations have also been programmed and calibration has been based on observed discharge by diagraphs and other parameters by field measurement. Suspended-sediment, particle- size, and other water-quality information is collected during discharge calibration measurements to define changes during tidal cycles.

2.0771, FLOW AND SEDIMENT TRANSPORT, RIO GRANDE CONVEYANCE CHANNEL

J.K. CULBERTSON, U.S. Dept. of Interior, Geological Survey, Albuquerque, New Mexico

The objective of this project is to utilize known techniques and to develop new techniques to obtain field measurements of hydraulic and sediment variables in a natural alluvial channel, and the analysis of the data relative to all aspects of flow in alluvial channels. The study reach is in the area of a control structure that has been constructed on the Rio Grande Conveyance Channel near Bernardo, New Mexico.

The project is designed to obtain accurate and complete field data for the entire range of bed configurations and flow regimes found in a sand-bed channel for a range of discharges, depths, and concentrations not heretofore available. The results of this investigation will supplement previous and current studies of hydraulics and sediment transport in sand-bed streams, and will be useful in extrapolating the results of flume studies.

2.0773, IRRIGABILITY CLASSIFICATION OF NEW MEXICO SOILS AS A GUIDE FOR WATER IMPORTATION

J.U. ANDERSON, New Mexico State University, School of Agriculture, Las Cruces - University Park, New Mexico 88001

The objectives of this study are to classify the soils of Eastern New Mexico according to irrigability classification based on basic soil surveys, and to identify distribution of the irrigable lands and those having limitations for irrigation.

The Pacific Southwest Inter-Agency organized a committee which met in July, 1967, and drew up and recommended the following classifications: Class 1 - None to slight soil limitations for sustained use under irrigation. Class 2 - Moderate soil limitations for sustained use under irrigation. Class 3 - Severe soil limitations for sustained use under irrigation. Class 4 - Very severe soil limitations for sustained use under irrigation.

Published and unpublished soil survey information from the Soil Conservation Service and the Agricultural Experiment Station, plus field observations and aerial photo interpretations will be used in this research project.

2.0774, A HISTORY OF WATER UTILIZATION IN THE SOUTHWEST, WITH PARTICULAR REFERENCE TO NEW MEXICO

I.G. CLARK, New Mexico State University, Graduate School, Las Cruces - University Park, New Mexico 88001

Effective utilization of its meager water resources has been a dominant problem in the Southwest from the time of its earliest known inhabitants. The present project is directed towards tracing historically the approaches to this problem, with emphasis on the period since its acquisition by the United States. Essentially it will be a history of the way in which water has been utilized in New Mexico. The project will deal with as many facets as possible, including the search for and husbanding of water, customs and laws controlling water rights, technical advances, divergent views regarding the most economic use to which water should be put, and conflicting opinions respecting the implementation of policies. Inescapably it will touch on such related themes as the administration of the public domain and conservation in general, but will not depart from the central theme of water use.

The method will be primarily one of examining documentary evidence: extracts from accounts of travelers, scientists, army officers and others who observed the country at various periods; Congressional hearings, documents, and debates; reports of Federal and State agencies charged with water administration; judicial decisions; records of private agencies; and the writings of authorities on the subject.

2.0775, FARM IRRIGATION EFFICIENCY AS INFLUENCED BY DESIGN, CONSTRUCTION, AND OPERATION OF IRRIGATION SYSTEMS IN SOUTHWESTERN NEW MEXICO

E.G. HANSON, New Mexico State University, Agricultural Experiment Sta., Las Cruces - University Park, New Mexico 88001

Objective: 1. To determine how efficiently water is being used on New Mexico farms under different a) designs of irrigation systems; b) operation practices; c) stages of plant or root growth; d) conditions or degrees of land preparation. 2. To determine relationships among the variables involved and to develop design and operation procedures by which these variables may be adjusted or combined to improve present irrigation practices and future irrigation systems.

Description of Work Proposed: On selected farms determinations will be made of the total quantity of water diverted, the source and magnitude of losses, and percentage of irrigation water delivered and effectively stored in the soil as available moisture. Soil moisture will be determined under cropped land before and after irrigation mainly by equipment using the neutron scattering method. Hydraulic characteristics of conveyance structure will be measured and physical features of the land and irrigation layout drawn on appropriate plans and profiles. Relationships between size of stream, time rate of advance, and uniformity of distribution in the root zone will be plotted with respect to the length of irrigation runs. These data will be evaluated to determine recommended adjustments in operation practices and desirable design features which will increase farm irrigation efficiency.

2.0776, USE OF RADAR FOR HYDROLOGICAL STUDIES

M. BROOK, New Mexico Inst. Min. & Tech., Graduate School, Socorro, New Mexico 87801

A comprehensive interdisciplinary water program of rain-drop growth, storm trajectories, precipitation patterns, run-off, evaporation, and underground water migration will be undertaken, incorporating the radars now being used in the cloud physics research program.

Two complete 3-cm radars are now in operation by New Mexico Institute of Mining and Technology personnel; one

2. WATER CYCLE

located about 1 mile west of the campus, the other at the Langmuir Laboratory on Mount Baldy Ridge, 16 miles west-southwest of Socorro. Both radars are capable of surveillance of rainfall over an area of approximately 20,000 square miles. A 10-cm radar capable of 30,000 square mile rainfall surveillance is on hand and will be used in the projected program.

A small suitable area of hydrologic interest, such as the Snake Ranch Flats area near the Institute facility, will be selected as a test area for an intensive study of the hydrologic parameters, involving atmospheric, surface, and underground phenomena.

The atmospheric physics group at the Institute is now actively engaged in complementary studies of natural rain formation and methods of induced precipitation growth and rainfall. For example, the role of electric forces in hindering and accelerating precipitation growth has been under intensive study for the past five years.

New York State Government

2.0778, LAKE EFFECT STORM STUDY

V.J. SCHAEFFER, State University of New York, Graduate School, Albany, New York 12203

Abnormal snowfalls occurring to the lee of Lakes Erie and Ontario produce a classical 'lake effect' similar to the local heavy snowfall that occurs independently of cyclones or fronts over the coast of the Japan Sea. These storms cannot be explained by usual meteorological means. ASRC has constructed a dynamic laboratory model, which includes the various parameters of the lake effect storm including warm water, cold air, a land barrier and means for controlling each separately. The Japanese have done the same.

During the winter of 1967-1968 a group of Japanese scientists will come to the U.S. to make cooperative simultaneous observations of the Great Lake Storms and during the winter of 1968-1969 U.S. scientists will visit Japan to observe the storms over the Japan Sea. The investigation of the mechanisms of 'lake effect' storms should contribute to more exact forecasting methods and a meteorological (as opposed to geophysical) study in this field.

SUPPORTED BY U.S. National Science Foundation

2.0779, THE ROLE OF LANGMUIR CIRCULATIONS IN MIXING OF LAKE GEORGE

J.T. SCOTT, State University of New York, Graduate School, Albany, New York 12203

An investigation of the role of Langmuir circulations in mixing of epilimnion water is proposed. The experiments are also designed to determine the specific mechanism which generates this organized type of circulation, and to test methods of observing these circulations. The field program will be closely allied with the development of workable theoretical models which are intended to apply in general to this circulation type.

The field program will include the following studies: 1. A correlation of foam line spacing with meteorologic parameters. 2. A refinement of methods of observing Langmuir circulations. 3. Measurement of currents within Langmuir circulations.

These field observations will be tied to an investigation of the heat transport caused by Langmuir circulations.

The results of this investigation will be applied directly to water resource problems. If Langmuir circulations produce a significant mixing in the epilimnion and the generation mechanism is well known, then steps may be taken to alter the heat balance of reservoirs or lakes and thereby influence evaporation from their surface.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res.
State University of New York

2.0780, THE ROLE OF LANGMUIR CIRCULATIONS IN MIXING OF LAKE GEORGE

J.T. SCOTT, State University of New York, Graduate School, Albany, New York 12203

Results from two years of study indicated that Langmuir circulations may be the most important cause of mixing in epilimnion water because they are able to transport heat to much deeper levels than ordinary turbulence.

The specific aims of the proposed second phase of this project are: (1) measurement of the current field in Langmuir circulations, (2) wave-interaction as a possible mechanism of Langmuir circulations, (3) thermal structure, spectra, and heat transport of Langmuir circulations, (4) laboratory experiments on the properties of air over surface films and, (5) field studies of the mechanism of Langmuir circulations.

These field experiments have direct application to water resource problems. If the mechanism of Langmuir circulations and the amount mixing they produce are known, steps may be taken to modify the effect they exert upon epilimnion properties such as temperature and concentration of gases, pollutants or other constituents. For example, by modifying the epilimnion circulation one modifies the heat balance and therefore also evaporation.

2.0781, FLOW AND SALINITY IN THE HUDSON ESTUARY, NEW YORK

M.W. BUSBY, U.S. Dept. of Interior, Water Resources Division, Albany, New York 12201

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of New York.

Purpose: To define the physical and chemical characteristics of the water in the estuary in order to provide a basis for management of this resource.

Method: River stage at each end of a reach (Poughkeepsie to Clinton) is continuously recorded. These time-synchronized stages are used with the power series method developed by Baltzer and Lai to compute tidal volumes. Water conductivity and temperature are continuously recorded at Poughkeepsie, Beacon, Peekskill and Peirmont. The conductivity data (a measure of salinity) will be related to tidal volume and movement and to fresh-water inflow as measured by several gaging stations on tributaries to the estuary.

2.0782, FORM, PROCESSES AND DEPOSITS OF THE KNIK RIVER, ALASKA

R.K. FAHNESTOCK, State University of New York, Graduate School, Fredonia, New York 14063

The Knik River of Alaska is a braided glacial stream which in most years experiences a catastrophic flood when Lake George bursts through its ice-dam. We propose to study the changing behavior and deposits of this gravel bearing river before, during, and after the flood. An understanding of the Knik will contribute to an understanding of the flood processes of 'normal' rivers which experience a catastrophic flood only occasionally, and to the interpretation of ancient fluvial deposits. This proposal covers the second year of a two year grant, NSF GA 696, originally made to the University of Texas.

2. WATER CYCLE

A considerable amount of data was collected during the summer, in spite of the failure of Lake George to fill and break out, and difficulties with equipment. To establish a reference for comparison before and after the flood, a variety of plane table maps of bars and bar features, and water surface and bottom profiles were made. Bar materials were painted. Surveys to establish a water surface profile based on Corps of Engineer temporary bench marks have largely been completed. Significant differences from the profile that could be developed from topographic maps of the area have been determined.

A large number of determinations of pebble size, shape and lithology have been taken in order to develop an understanding of the sorting and alteration of valley train gravel by the flood transport. Grain size tends to decrease in a down valley direction, although this trend is also influenced by local source rocks. Shape-studies suggest that shape-sorting may be important. A second summer of observations will furnish details in sediment-transport picture.

Several different bar types occur in the Knik Valley. Although their distribution is not clearly understood at this point, it appears to be systematic. Further observations are planned for the second field season.

2.0783, LAKE ERIE ENVIRONMENTAL STUDIES PROGRAM

J.A. JONES, State University of New York, Lake Erie Environ. Stud. Prog., Fredonia, New York 14063

The Lake Erie Environmental Studies program has been established to support and coordinate environmental research focused on the lake at Fredonia. A lakeside laboratory is available for use by investigators from Fredonia and other interested institutions. A program of continuous environmental data monitoring has been initiated to provide support for investigations. Data gathered include meteorological, physical, chemical, biological, and geological. These data will be compared with conditions in the eastern basin of Lake Erie.

In addition to standard environmental data monitoring, several pilot studies are to be conducted annually to provide basic information necessary for requesting outside support. This year such programs include delta sedimentation from a lake shore stream, distribution of aquatic insects along the New York shoreline, fish mortality cycles, algal metabolism, utilization of products of eutrophication, and a survey of near-shore aquatic organisms.

SUPPORTED BY State University of New York

2.0784, STUDY OF SNOW CRYSTAL TYPES IN GREAT LAKES SNOWSTORMS

R.G. LAYTON, State University of New York, Graduate School, Fredonia, New York 14063

For the past two winter seasons some small efforts have been made at Fredonia to look at the snow crystal types in lake effect storms. In the coming winter we hope to expand this effort and attempt to take systematic replications in a variety of storms, both of the lake effect and the non-lake effect types. In addition we propose to do some exploratory work in evaluating the iodine content of the snow using neutron activation analysis.

To accomplish this we propose to set up three permanent stations and instruct an observer at each in the proper observational techniques and in rough preparation of the data. These same observers will also take snow samples for analysis. By utilizing people who live at the observation site, it is hoped to obtain a high degree of reliability in the observations, and we expect to recover a good percentage of the possible data. The location of the proposed stations is shown on the map. At each station we propose to put a continuous replicator and such other equipment as finances allow.

2.0785, HETEROGENEOUS NUCLEATION OF ICE

R.G. LAYTON, State University of New York, Graduate School, Fredonia, New York 14063

In the past decade there has been rapid progress in our understanding of the heterogeneous nucleation of ice (Fletcher, 1962; Mason, 1957). There is still, however, a gap between theory, laboratory experiments, and field experiments. Part of the problem has been that the experimental conditions are in many cases not well known. Studies of nucleation and growth of ice under more carefully defined conditions of the surfaces of single crystals should provide information which will help close these gaps in our knowledge. The goal of the proposed research is to provide experimental facts which will increase our fundamental understanding of the heterogeneous nucleation of ice. The research will be directed toward the study of the effects of radiation of various wavelengths together with the effects of addition of various impurities on the nucleation of ice by silver and lead iodide.

The photolytic decay of silver iodide and its effect on ice nucleation have been the object of several recent studies, several of which indicated an increase in nucleating ability of silver iodide upon first being exposed to light. This effect was predicted by Papee (1962) on the assumption that the increase in dislocation density caused by the decomposition would result in an initial enhancement of the ice forming capacity of the salt. Further study of the details of the effect of this on ice nucleation is needed.

Observations of this kind can be carried out very effectively by observing the temperature and vapor pressure at which ice grows on the faces of a single crystal as it is exposed to light of different wavelengths and intensities for different times.

A cold chamber will be constructed and so designed to give good control of the temperature and the vapor pressure at which the crystals of ice are to be grown. The growth will be observed by means of a microscope.

2.0786, AQUATIC BIOLOGY INVESTIGATIONS

M.M. ALEXANDER, New York State Agric. Sta., Geneva, New York 14456

Objective: To study various physical and biotic problems in lakes and streams as related to fish, waterfowl and furbearers.

Progress: 1) A comparative field study of the ecology of the three forest ponds on the Tully Forest was conducted. 2) Planning was carried out for an ecological study relating aquatic invertebrates to aquatic vegetation. This is an important basic study in waterfowl management. 3) A study was completed on the ecology and movements of muskrats on marginal habitat of the Adirondacks. A paper was given at the Northeast Wildlife Conference. 4) A study of the trout and their movements in the tributaries of Wolf Lake on the Huntington Forest was conducted this year, and will be continued through next year. 5) Brook trout in Tully Forest ponds are growing very rapidly and a plan to open some of these ponds for fishing under a permit system has been completed in cooperation with Mr. Engleken. A new supply of brook trout has been ordered. Rainbow trout are present, but not doing very well. Bass, sunfish and bullheads are doing very well in the headquarters pond.

Plans: To complete sub-projects 1 and 3 above in 1965, and continue 2, 4 and 5. Also to institute one new project.

SUPPORTED BY New York State Government

2.0787, A STUDY OF SNOW INTERCEPTED BY CONIFEROUS TREE CROWNS AND ITS DISPOSITION UNDER THE CLIMATIC CONDITIONS OF CENTRAL NEW YORK

A.R. ESCHNER, New York State Agric. Sta., Geneva, New York 14456

Objective: Exploratory study of quantity of snow intercepted by coniferous tree crowns of commonly planted species.

Progress: Devising methods of supporting and weighing small conifers; developing equipment to measure snow in crowns.

2. WATER CYCLE

SUPPORTED BY New York State Government

2.0788, TREE NUTRITION AND FOREST FERTILIZATION

A.L. LEAF, New York State Agric. Sta., Geneva, New York 14456

Objective: Determine moisture and/or nutrient element effects on soil fertility as expressed by growth and development of, and nutrient element uptake and distribution in trees. Work confined to Pack Forest plain.

Progress: Initiation of irrigation system for moisture-nutrient interaction study. Detailed investigation of site variability, a confounding factor in interpreting responses to fertilizer additions.

Plans: Further work on irrigation - fertilization study, determining effect of fertilizers and/or water treatments on tree growth and development.

SUPPORTED BY New York State Government

2.0789, SOIL MOISTURE AND FRUIT GROWTH IN RELATION TO WEATHER CHECKING OF MCINTOSH APPLES

E.F. TASCHENBERG, New York State Agric. Sta., Geneva, New York 14456

Fruit growth, soil moisture, and the incidence and severity of weather checking are compared under four treatments designed to alter the normal seasonal patterns of available soil moisture in an effort to determine the role of fluctuations in soil moisture in the development of weather checking.

SUPPORTED BY New York State Government

2.0790, SOIL-PLANT-WATER RELATIONSHIPS

M.T. VITTUM, New York State Agric. Sta., Geneva, New York 14456

Objective: To determine the influence of plant and environmental variables upon water extraction from the soil profile.

Work Proposed: The main and interactive effects of irrigation, variety, spacing and other variables upon extraction of water from the soil profile will be measured on a number of crops, including tomatoes, snap beans, lima beans, cabbage, broccoli and peas. Most of these crops will be harvested sequentially in order to determine the effects of treatments on maturation and quality as well as yield.

New York State Government

2.0791, CLIMATE OF THE NORTHEAST - ANALYSIS AND RELATIONSHIP TO PLANT RESPONSE

M.T. VITTUM, New York State Agric. Sta., Geneva, New York 14456

Objectives: 1. To determine, using phenological measurements, the response of selected plant species to environment. 2. To conclude the present studies of the influence of climatic variables on plant response.

Work proposed: 1. Persian lilacs will be planted at 50 or more locations in New York State. Dates when leaf bud scales break, first flowers open and last flowers open will be correlated with the weather data obtained at each location. 2. The present study comparing actual ET, as measured from changes in soil moisture, with calculated ET, as obtained from various formulas, will be continued and concluded. Various formulas will be compared and development of a new formula using multiple correlation techniques will be explored.

2.0792, APPLICATION OF AERIAL PHOTOGRAPHS FOR THE INVESTIGATION OF THE DISCHARGE PROPERTIES OF DRAINAGE BASINS

D.J. BELCHER, Cornell University, School of Engineering, Ithaca, New York

This project proposes to develop methodology which would give estimates of the yield pattern of water from a basin where

stream flow records are non-existent or incomplete. Planning can rarely wait until our data is truly adequate. Indeed, our capacity to conceive of ways to use more and better data is usually far ahead of our capacity to generate it. This project is a step toward correcting this imbalance. It would provide a better basis than we now have while waiting for precise discharge statistics to be generated over the years.

Stream flow measurement stations have increased rapidly in recent years, but this still means that we often must rely upon long-term discharge data from only a few stations. Statistical techniques for extending the data we have are far better than they were. But this project will provide a technique through air photo interpretation for making estimates where measurements don't exist or are too scanty to be adequate.

2.0793, A THREE-DIMENSIONAL APPROACH TO THE EXCHANGE OF HEAT AND WATER VAPOR BETWEEN A LARGE WATER BODY AND THE ATMOSPHERE

W. BRUTSAERT, Cornell University, School of Engineering, Ithaca, New York

The investigation involves the study of the physical and mathematical foundations underlying simultaneous turbulent heat and water vapor exchange between a large open water body and the surrounding atmosphere for various conditions of local atmospheric advection and of solar and other energy input into the water body. This will be accomplished by analyzing the solvability of the partial differential equations describing turbulent diffusion in the atmosphere subject to the appropriate boundary conditions.

The main objective of the proposed research is to gain a better understanding of these phenomena in order to assess and improve the presently available theoretical models. This will then in turn allow the development of practical engineering procedures to better predict cooling and evaporation from water reservoirs, especially in connection with thermal power station design than is possible at present.

2.0794, STUDY OF GEOLOGIC STRUCTURAL CONTROL ON THE FLOW AND DISCHARGE OF GEOTHERMAL WATERS

G.A. KIERSCH, Cornell University, Graduate School, Ithaca, New York

This research is intended to study the effect of geologic structure on the underground movement and discharge of groundwater, heated by the earth's natural heat. A typical geothermal area was selected in the Southwestern sector of Iceland where the Research Assistant has already completed five months of field work necessary for this project.

Laboratory investigations will now be conducted on the rock samples collected during the field work to establish the geologic structure, correlation and analysis of all the data leading to interpretations and preparation of maps and cross-sections to be included in the final report.

2.0795, WATER SUPPLY-DEMAND

D.J. ALLEE, State University of New York, School of Agriculture, Ithaca, New York 14850

Generally, the objective of the project is to provide improved methodology and new or improved knowledge about the supply of water available to New York State and the adjoining states in the Northeast region, including ultimately the influence of Canada, and the demands that will be made on such supplies for domestic, municipal, industrial, agricultural and recreational purposes; for the propagation of fish, aquatic life and wildlife; and for other purposes.

2. WATER CYCLE

Specifically, the objective of the project is to review planning methodology including hydro-meteorological and engineering analyses, socioeconomic investigations and data processing and programming studies that (a) estimate present water use, potential supply and capacity of existing development on a comparable and uniform basis; (b) estimate the supply functions for water (i.e., what each successive increase in developed capacity might cost); (c) construct projections of water use by each water function; and finally match the demand data to the water supply data. Subsequent approximations would aim at refining information with particular emphasis on water supply data and on improving the evaluation of water demand projections, considering the cost of meeting such demands.

This project was started in Fiscal Year 1965 and the completion date is indefinite at present.

2.0797, DIFFUSION OF OXYGEN ACROSS THE MUD-WATER INTERFACE IN AQUATIC ENVIRONMENTS

D.R. BOULDIN, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

Objective: To develop procedures for measuring oxygen consumption by aquatic muds under a variety of laboratory and field conditions, and to relate the measured oxygen consumption to the various hypotheses presented in Appendix I.

Work Proposed: Two procedures are proposed for measuring oxygen consumption in the aquatic muds. In one procedure the amount of oxygen required to maintain predetermined concentration of oxygen in a thin layer of water above a core of mud is measured over a period of several hours. This is accomplished by using an oxygen electrode to control an infusion pump fitted with an oxygen-filled syringe. In the other procedure the drop in concentration of oxygen across a membrane of known permeability in contact with the mud is measured. Measurements of oxygen consumption in the laboratory by cores taken in the field will be made under a variety of conditions. The relationship between oxygen consumption and such variables as temperature, oxygen concentration, past history of the core, chemical characteristics of the core and productivity of the water. The pattern of oxygen consumption will be studied in relation to the models which have been derived from diffusion theory. Measurements of oxygen consumption will be made in the field in order to verify the inferences made from the laboratory studies.

2.0798, A STUDY OF TECHNIQUES FOR INCREASING EFFICIENCY OF IRRIGATION WATER APPLIED TO POTATOES

E.E. EWING, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

To determine at which stage (s) of development of the potato plant moisture stress is most harmful; and to learn whether the measurement of cell sap concentration by refractometer offers a superior method of discovering at what point the potato plant is being adversely affected by soil moisture stress.

In order to pursue the first objective it will be necessary to control the water reaching plants. Therefore emphasis will first be placed upon developing techniques for performing irrigation research under plastic covers (developed by Dept. of Agricultural Engineering) and learning whether plants under covers respond to irrigation in the same way as do plants in the open field. If results indicate that the covered plot technique is valid for studying responses to irrigation under field conditions, covered plots will be used to provide a controlled moisture regime for investigating the effects of moisture stress at different stages of development of the potato plant.

Determinations will be made of the effects of various environmental conditions and cultural practices on cell sap concentration (as measured by refractometer) and on changes in cell sap concentration following irrigation. Results will be evaluated from the point of view of learning whether cell sap concentration measurements would be helpful in predicting when to irrigate potatoes.

SUPPORTED BY New York State Government

2.0799, THE PHYSICAL AND CHEMICAL PROPERTIES OF WATER AND SOILS AS RELATED TO THE SUCCESSFUL GROWTH OF WATERFOWL FOOD AND COVER PLANTS

D.J. LATHWELL, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

1) To obtain specific information on the factors affecting the development of waterfowl foods and cover plants as influenced by soil and water conditions. 2) to define these requirements for the successful growth of waterfowl foods and cover plants on soils flooded from a depth of one foot to three feet, at intervals of six inches.

Description of Work Proposed: Studies will be made of aquatic plant growth and soil and water characteristics associated with their growth. Special attention will be given to oxygen level in water and the concentration in the soil of elements which might be toxic to plant growth.

SUPPORTED BY New York State Government

2.0800, EVALUATION OF SOIL AND WATER CONSERVATION DESIGN

G. LEVINE, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

To evaluate the performance of soil and water conservation practices and to relate this performance to the design procedures for the purpose of improving the efficiency of these procedures. Subproject 1. Stone center drains. The performance of a representative group of stone-center drains in Central N. Y. will be evaluated. Designs based upon tractive force theory will be prepared for each drain. Constructed design will be compared with tractive force design and related to performance. Subproject 2. Contour row lengths and operational efficiency of selected farm machines. Subproject 3. Debris basin design capacity. To determine expected rates of debris accumulation, as influenced by precipitation, runoff, and geomorphological conditions. Debris accumulation in existing debris basins will be measured and correlated with local precipitation and runoff records.

New York State Government

2.0801, PHYLLOSILICATE WEATHERING IN UNCONSOLIDATED MATERIAL OF WISCONSIN AGE IN A HUMID TEMPERATURE ENVIRONMENT

M.H. MILFORD, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

a. Characterization of the weathering sequences and weathering rates of inherited phyllosilicates in relation to pedogenic sequences of soil morphology as affected by differences in drainage and water movement within the soils of a catena. b. Characterization of the pedogeochemical reactions which occur in the interfacial zone between the eluvial and illuvial horizons during soil formation to produce a thickened eluvial horizon at the expense of the illuvial horizon.

2. WATER CYCLE

Soils formed in glacially derived parent materials and representing at least three degrees of wetness within each of three lime levels (parent material) will be selected for this investigation. A study of water table fluctuation at each site will be initiated. Each soil will be described and sampled in as much detail as possible. Laboratory analyses of the samples will involve thin section studies, mechanical analysis, preparation for and conduction of mineralogical analyses, and some chemical analyses. The relationships between the data thus obtained and the observed soil-water relationships will determine the course of further investigations.

2.0802, MECHANISM OF FROST HEAVING

R.D. MILLER, State University of New York, School of Agriculture, Ithaca, New York 14850

Research has been conducted on the mechanisms of soil freezing and frost heaving in three phases. Phase I was a theoretical consideration of the mechanisms, while Phase II was an experimental study of certain predictions achieved in Phase I. During this research, it was discovered that gypsum was apparently effective in reducing frost heaving. Phase III was an independent study concerned with alleged interactions between waxes and silicone surfaces, involving studies of phase equilibria, film flow studies (of a liquid-like layer which apparently exists between ice and soil particles) and closed system heaving studies of soil particles in a moist soil without ice lens formation. Rate of heaving can be predicted although computations are rather lengthy and involved. Water movement in finely divided ice at temperatures between 0 degrees and -10 degrees has been shown to be quite small; approximately at the rate one would expect from vapor diffusion. This work was initiated in FY 64 and final payment made in FY 68. The final report (letter report referring to 13 CRREL research reports authorized by letter) was submitted 24 June 1965 to the C.G. U. S. Army Cold Region Research and Engineering Laboratory, Hanover, N. H.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0803, BASIC RESEARCH IN THE AQUATIC ENVIRONMENT EFFECTS OF EUTROPHICATION ON PLANKTON ALGAE AND BENTHIC PLANTS COMMUNITIES

H.F. MULLIGAN, State University of New York, School of Agriculture, Ithaca, New York 14850

The composition of submerged and planktonic aquatic plant communities will be examined to determine the effects of different levels of enrichment over a period of 3 years. Six species of submerged aquatic plants will be established in the bottoms of twenty, one-quarter acre earthen ponds containing 200,000 gallons of water. Species selected include *Potamogeton pectinatus*, *P. crispus*, *Myriophyllum exalbescens*, *Chara Vulgaris*, *Ceratophyllum demersum* and *Elodea canadensis*. These plants have world wide distributions and commonly occur in abundance in the local aquatic plant flora.

Three levels of a mixture of soluble organic and inorganic fertilizers containing nitrogen and phosphorus will be added to the water of specific ponds weekly for a period of twelve weeks during the summers of 1968 and 1969. The growth of each plant species will be observed under the different enrichment regimes. The movement of the fertilizer within the aquatic ecosystem will be followed.

By beginning with an unmodified environment and adding known quantities of enrichment material, it will be possible to isolate the effects of eutrophication on planktonic and benthic plant populations and make predictions of the effects of current cultural practices.

2.0804, IRRIGATION STUDIES WITH TOMATOES

G.J. RALEIGH, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

To evaluate the cell sap concentration method for determining the need for irrigating tomatoes, to determine the requirements for big acre yield of high quality fruit as they are affected by moisture level and regulation of the nitrogen supply and to observe the relationship between moisture, nitrogen and blossom-end rot.

Previous work on an Arkport fine sandy loam soil gave yields as high as 32 tons of Glamour tomatoes to the acre in 1962 a year of low temperatures especially in September. Yields in 1963 were somewhat lower due partially to nitrogen deficiency. An average yield of 40 tons to the acre should be a possibility on such a soil type. Excessive nitrogen delays maturity and greatly reduces yields of a variety such as Glamour if frost comes early. Inadequate nitrogen reduces yields. These relationships need additional experimentation. Several years of work with the cell sap concentration method of determining need for irrigation suggests that the method has merit but the effect of varying nutrient levels, time of making the test, and the interpretation of the deficiency index require more work. Blossom-end rot still remains a little known physiological disorder.

SUPPORTED BY New York State Government

2.0805, THE ECOLOGY OF SELECTED SUBMERSED AQUATIC WEEDS

E.L. STONE, State University of New York, Agricultural Experiment Sta., Ithaca, New York 14850

To study the growth and development of *Myriophyllum*, *Potamogeton*, *Elodea*, and *Najas*, and algae as affected by (a) chemical variables, such as nutrients and other dissolved solids, pH, and dissolved gases, (b) physical variables, such as light, temperature, water depth and flow and turbidity, and (c) biological variables, including competition, predation, and stimulation; and to relate the results obtained to the incidence, distribution, management, and control of the above-mentioned genera. The New York station will undertake to (a) establish inorganic nutrient requirements, and optimum pH levels following chemistry of water in ponds. Single effects and interactions of light, temperature, water depth, turbidity and soil conditions on the named species will be studied. Effects of photoperiod on germination, shoot growth and flowering, as well as effects of other environmental factors on germination will be studied under controlled conditions. Effects of competition among the named genera will be investigated in the greenhouse and under field conditions. Organisms feeding on the named genera will be identified and collected. Promising leads will be investigated further as the project progresses, utilizing 1/10-acre ponds, greenhouse, and growth chamber as appropriate.

2.0806, IN SITU STUDY OF FACTORS CONTROLLING NUTRIENT REGENERATIONS IN THE BOTTOM SEDIMENTS

D.A. WEBSTER, State University of New York, School of Agriculture, Ithaca, New York 14850

The proposed study will deal with the physical, chemical, and biological factors influencing nutrient regeneration in the sediments of four Adirondack ponds, selected for differences in water chemistry, sediment characteristics, and abundance of rooted aquatic vegetation. The relation between water chemistry, sediment chemistry, and rates of microbiological decomposition in the sediments will be used to elucidate mechanisms and rates of phosphorus regeneration. Investigation in situ by using polyethylene enclosures of selected areas of pond bottom and overlying water, makes possible the alteration and control of water and sediment chemistry, permitting simultaneous observations in the four ponds of the effects of varying organic matter levels, pH exchange capacities, and Fe, Mn, and Al concentrations on rates of microbiological activity and phosphorus regeneration.

2. WATER CYCLE

2.0807, INVESTIGATION OF PHOSPHORUS AVAILABILITY IN OLIGOTROPHIC LAKES

D.A. WEBSTER, State University of New York, School of Agriculture, *Ithaca, New York* 14850

The main objective of the project will be to determine the effects of lime application to sediments in an infertile lake as measured by the following factors: 1. Phosphorus fixation and distribution in the sediments. 2. Phosphate retention capacity and rate of adsorption. 3. Phosphate exchange capacity and equilibrium concentrations maintained in the interstitial water and free water over the sediments. 4. Bacterial activity in the sediments. 5. Production of benthic algae, periphyton, and phytoplankton. 6. Phosphorus content of the above forms. 7. Zooplankton standing crops and composition. 8. Development of the macro flora. 9. Fish growth and standing crop.

Additional information that will be obtained to complement the field program consists of: 1. Determining the relative significance of bacterial and inorganic phosphate transfer between sediments and water. 2. Comparative contributions of phosphorus to the lake from the bottom sediments allochthonous sources will be evaluated by determining phosphate exchange rates, exchange capacity, and diffusion coefficients of the mud-water system and monitoring phosphorus inputs and losses.

2.0808, THE ENERGY BUDGET AT THE EARTH'S SURFACE

E.R. LEMON, U.S. Dept. of Agriculture, *Ithaca, New York*

Object: To measure, understand, and control the plant, soil, and meteorological interaction involved in the partition of energy at the earth's surface.

Plan of work: (1) Experimental and theoretical methods will be employed to increase the understanding of carbon dioxide and water vapor transfer by turbulent processes near the ground in agricultural crops. (2) Methods of crop management to increase the turbulent transfer of carbon dioxide will be investigated. (3) Controlled experiments in an aerophytotron (wind tunnel) will be aimed at further understanding of factors controlling heat and water vapor exchange directly from the soil. (4) The effect of soil moisture, ambient temperature, humidity, radiant energy (quantity and quality), and other factors on transpiration and stomatal behavior under different controlled conditions will be evaluated. (5) Methods will be explored for controlling transpiration and stomatal behavior.

2.0809, QUANTITATIVE WATER-BUDGET ANALYSIS OF WESTERN LONG ISLAND, NEW YORK

O.L. FRANKE, U.S. Dept. of Interior, Water Resources Division, *Mineola, New York* 11501

This research is part of the program of water resources investigations carried on in cooperation with the Counties of Nassau and Suffolk, New York.

The purpose of this research is to review the continuity principle (hydrologic-budget concept) as it applies to the entire hydrologic system and to the ground-water subsystem of western Long Island.

This will be based on a hydrologic budget estimated for predevelopment (natural) conditions; and on hydrologic budgets for the entire project area and for subareas, designated on the basis of the degree of development (or overdevelopment), for selected subsequent time intervals. These budgets will demonstrate quantitatively the impact of man's activities on the hydrologic regimen and how those activities have affected the perennial yield of the system. The relation of the continuity principle to virtually all quantitative management decisions will be sought by means of specific evaluations of the hydrologic effects of proposed alternative methods of development -- especially

those proposed for managing the ground-water resources of Nassau County.

2.0810, STUDY OF INFLUENCE OF STRATIFICATION ON CURRENT STRUCTURE

G. NEUMANN, New York University, School of Engineering, *New York, New York* 10003

This research proposal is concerned with the study of the circulation of Lake Michigan. Rotary currents with the local inertial period have been found to be very prominent in the data and frequently mask other long and short term current variations. In order to obtain more definitive clues as to their nature, it is proposed to separate these currents from the data by a least squares technique. This will enable us to study not only the vertical and horizontal structure of these rotary currents but also the residual circulation that remains after the rotary current has been subtracted.

2.0811, MEASUREMENT OF WATER VAPOR FLUX ABOVE A LAKE SURFACE BY MEANS OF OPTICAL TECHNIQUES

E.E. CHERMACK, State University of New York, Graduate School, *Oswego, New York* 13126

The substance of this project is to measure the humidity profile in the atmosphere above an evaporating surface by means of infrared transmission measurements. Transmission of radiant energy through an atmosphere is determined primarily by attenuation due to scattering and absorption, both of which are wavelength dependent. If the transmission over a known physical distance is measured for two beams of light, closely separated in wavelength, the transmission of a wavelength within an absorption region of water vapor will be appreciably lower than the transmission of a wavelength just outside the absorbing spectral region. The variation in the ratio of the two transmissions should then be an indication of the variation in total water vapor along the physical transmission path.

The research effort here is to determine the feasibility of such an experiment, particularly with regard to the problems engendered by molecular and aerosol scattering losses. If such can be overcome by judicious choice of wavelength interval and scheduling of subsidiary experimental measurements, selection and design of the transmitter, receiver and recording apparatus will get underway, with field experiments over the surface of Lake Ontario near Oswego to follow.

SUPPORTED BY State University of New York

2.0812, CHAMPLAIN VALLEY PRECIPITATION STUDY

M.H. TOURIN, State University of New York, Graduate School, *Plattsburgh, New York* 12901

This project is a pilot study to determine the effects, if any, of the Plattsburgh industrial area (mainly wood pulp processing) on precipitation characteristics in the Champlain Valley. To achieve the objectives of the study, a rain gauge network has been set up over a portion of the Valley and the variation of rainfall intensity and sulfur content is being documented. These variations are being correlated to wind speed and direction. In addition, Lake temperature, air temperature above the Lake, and dew point above the Lake are being determined in the vicinity of the industrial area, and also at a distant control location. These parameters, combined with wind and temperature data on land, are also being used to determine evaporation anomalies and an objective lake breeze index.

2. WATER CYCLE

U.S. National Science Foundation

2.0813, FISH MOVEMENTS IN THE NORTH INLET OF WOLF LAKE, HUNTINGTON FOREST

R.W. BERNHARDT, State University of New York, Graduate School, Syracuse, New York 13210

Objective: To study the movement behavior of brook trout and other fish in a small Adirondack stream. To correlate these movements with environmental factors such as water flow, water temperature, cover, time of spawning, and presence of other species of fish.

Progress: 1) The installation of recording thermographs, water level recorder, two-way fish trap at the mouth of the stream, and numerous portable fish traps in the stream. 2) The tagging of several hundred brook trout and the subsequent capturing of many of them.

Plans: Intensive trapping of the fish population, tagging and recapture, to determine movement patterns.

SUPPORTED BY New York State Government

2.0814, A COMPARATIVE STUDY OF THE MACROSCOPIC BENTHIC FAUNA OF TWO CENTRAL ADIRONDACK LAKES

R.W. BERNHARDT, Syracuse University, Graduate School, Syracuse, New York 13210

Objective: 1. Determine what species make up the benthic fauna of Catlin and Wolf Lakes. 2. Study the benthic animal communities, their species composition, distribution and seasonal change.

Progress: The species composition of the bottom fauna is at present (1964) being determined. The taxonomic groups, Ephemeroptera, Odonata, and Trichoptera have been worked over. The order Diptera is being worked on at present.

Plans: 1. The continuance of the taxonomic work on the rest of the groups. Have the species identifications checked by specialists. 2. Begin the final report in 1965.

SUPPORTED BY New York State Government

2.0815, FOREST TREE NUTRITION AND FOREST FERTILIZATION

A.L. LEAF, Syracuse University, Graduate School, Syracuse, New York 13210

Objective: To determine nutrient element effects on soil fertility and their interaction with soil moisture as expressed by growth and development of, and nutrient element uptake and distribution in trees. To gain an understanding of the fundamentals of the nutritional aspects of tree growth and development, research continues on coniferous species in fertilized and/or irrigated and unfertilized plantations supported by nutrient element deficient, deep sandy soils.

Research Program: 1) Irrigation-fertilization study to determine moisture - potassium fertilization effects on growth and development, and uptake and distribution of nutrient elements of *Pinus resinosa* Ait. plantations on soils of various degrees of potassium deficiency. 2) Total tree analysis study of nutrient uptake and distribution in various treated and control plots of various coniferous species. 3) Root growth and development of 35-year-old *Pinus resinosa* on potassium deficient and nondeficient plots on deep outwash sandy soil. 4) Chemical analysis of various tree components for N,P,K,Ca,Mg,Na,Al,B,Co,C,Fe,Mn,Si,Zn by spectrophotometric, flame spectrophotometric and atomic-absorption spectrophotometric techniques. All research conducted on the Charles Lathrop Pack Forest in southeastern Adirondack Region of New York.

SUPPORTED BY U.S. National Science Foundation

2.0816, DIATOM POPULATIONS CHANGES IN LAKE GEORGE

N.L. CLESCERI, Rensselaer Polytechnic Inst., School of Engineering, Troy, New York 12181

The proposed research is directed towards characterizing and measuring the diatom populations in the plankton and periphyton found over an extended period of time at various depths and locations in Lake George, New York. This work is expected to provide the biological data needed to establish the pattern and rate of eutrophication in this popular recreational lake and is an essential part of a comprehensive interdisciplinary study of a limnological model for Lake George being conducted by the Rensselaer Polytechnic Institute. The identification and measurement of the principal diatom species by light and electron microscopy along with the measurement of total plankton and periphyton by microscopy, gravimetry and extraction-spectrophotometry, when correlated with the other detailed measurements (temperature, light intensity, water quality) which will be made at the same depths and locations can be utilized to identify the causative factors for the biological changes taking place.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

2.0817, ESTUARINE BIOLOGY--RESPONSE OF LARVAE TO TEMPERATURE AND SALINITY

R.M. LICHTENHEK, U.S. Dept. of Interior, Biological Laboratory, Beaufort, North Carolina 28516

Atlantic menhaden hatch in the ocean and migrate into shallow estuarine nursery areas as larvae. The effect of temperature and salinity on survival may be a determining factor in year class size. Field observations have shown that low temperatures delayed entry of larvae into the estuary from the ocean and after establishment in the nurseries, caused massive mortalities. Laboratory experiments were conducted to determine the lethal temperatures. Preliminary findings confirmed the field observations that 3 degrees C. may be the lower limit at estuarine salinities.

Plans are underway to continue the laboratory work when larvae become available in January 1964. Methods consist of holding larvae at various temperatures and salinities, with and without acclimatization to lower temperatures, to determine the lethal limit of chilling.

2.0818, PRODUCTIVITY OF ESTUARINE AND MARINE ECOSYSTEMS (A COOPERATIVE AGREEMENT WITH THE ATOMIC ENERGY COMMISSION)

R.B. WILLIAMS, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

All life ultimately depends on autotrophic organisms. Therefore, knowledge of primary production in estuaries is required for evaluation of their potential to produce commercially important fish and shellfish and for elucidation of the movement of radionuclides through estuarine food chains into edible species. The primary production of phytoplankton and benthic algae, two groups of autotrophs important in the characteristically shallow southeastern estuaries, is being measured at regular intervals in inshore waters near Beaufort, N. C. Phytoplankton production is estimated by the light and dark bottle technique. Bottles of seawater (with zooplankton removed by filtration) are incubated for 24 hours at several fractions of surface illumination, and changes in dissolved oxygen are determined by titration. To estimate benthic production, areas of bottom are enclosed (in situ) for 24 hours beneath clear and opaque plastic bell jars, and changes in dissolved oxygen within the jars are obtained by titration of water samples withdrawn from them. In addition, measurements of standing crop accompany the measurements of production.

2.0819, MEASUREMENT OF RADIONUCLIDES IN ESTUARINE AND MARINE ENVIRONMENTS (A COOPERATIVE AGREEMENT WITH ATOMIC ENERGY COMMISSION)

D.A. WOLFE, U.S. Dept. of Interior, Radiobiological Lab., Beaufort, North Carolina 28516

Many scientists have been concerned with the potential effects on marine organisms of low-level radioactive wastes from

2. WATER CYCLE

nuclear reactors on land as well as those on ships and submarines. Additionally, fission products from nuclear weapons are now found in the biosphere. To evaluate the ecological effects of radionuclides on organisms of commercial importance, it is necessary to know the quality, quantity, and form of radionuclides in estuarine and marine environments. These data are needed now so they can be utilized to establish base lines for existing levels of radioactivity in various components of estuarine and marine ecosystems, and so the mechanisms of uptake in the passage of radionuclides through food chains can be investigated.

Large samples of biological materials (1 kg.) are collected for analyses. These samples are either dry ashed or wet ashed to reduce the volume and to provide homogeneous samples. The gamma activity of the samples is then measured with a low background detection system consisting of a multichannel analyzer and a 4 x 4-inch sodium iodide crystal-detector housed in a 7-ton shield. The data for each sample are stored on binary-coded punched tapes which can be used in a computer for comparisons with the radioactivity of future or past samples.

2.0820, OPTIMUM ECOLOGICAL DESIGNS FOR ESTUARINE SYSTEMS OF NORTH CAROLINA

H.T. OLSON, Univ. of North Carolina, Inst. of Marine Science, Chapel Hill, North Carolina 27514

This project will provide information on the feasibility of establishing associations of organisms in estuaries which can process man's wastes, metabolize inflow, develop the missing loops of the mineral cycles, and channel the fertility into one or more populations with food potential. Nine marine ponds will be constructed in a high marsh area along the coast of North Carolina. Three of the ponds will be continually seeded with mixtures of marine organisms (larvae, adults, plankton, micro-organisms, etc.) and will receive a steady flow of urban waste mixed with sea water. Three ponds will be seeded, but will be supplied only with sea water, i.e., no wastes. The remaining three ponds will receive the wastes mixed with sea water, but will not be seeded artificially.

Principal populations, some principal nutrient cycles and the total photosynthetic production and system respiration will be measured. Those populations of larger organisms which develop in large mass will be studied for growth rate and not production per area of meat potential.

2.0821, COMPUTER SIMULATION OF AQUIFERS OF COASTAL PLAIN OF NORTH CAROLINA

J.K. SHERWANI, Univ. of North Carolina, School of Public Health, Chapel Hill, North Carolina 27514

Ground water management in the Coastal Region of North Carolina is the foremost water resource problem in the State due to the massive impact of large concentrated withdrawals by the existing and proposed phosphate mining operations. The limestone artesian aquifer involved (Castle Hayne) is the most important source of fresh water for agricultural, municipal, and industrial use in the area. Salt water intrusion poses a potential threat. The objective of the project is to investigate the dynamic behavior of the Castle Hayne aquifer. Three stages of the study are envisioned: (1) System identification through a specification of the aquifer characteristics at different locations and of the boundary configuration. General purpose analog and digital computers will be used in this phase; (2) Direct Analog model; a passive resistance-capacitance network will be constructed to model the ground water system in greater detail; (3) Prediction of Response; i.e., to forecast the water level changes under different assumed conditions of replenishment and extraction. Passive analog and digital computers will be used in this phase. The project will be started in FY 1968 and is anticipated to be completed by the end of FY 1970.

2.0823, MULTIPURPOSE RESERVOIRS AND URBAN DEVELOPMENT

S.F. WEISS, Univ. of North Carolina, Graduate School, Chapel Hill, North Carolina 27514

The proposed research seeks to develop the foundations of a forecast model which may be utilized to predict the pattern of development surrounding large multipurpose reservoirs. The research plan is based on a conceptual framework and approach to the study of land development that has evolved at the Center for Urban and Regional Studies, in Chapel Hill, during the past ten years. This approach views land development as the result of the interaction between environmental influences flowing from physical characteristics on the site, location of the site relative to activity nodes and the spatial pattern of social values, and institutional factors (such as the matrix of federal, state, and local policies) and a chain of key primary and supporting decisions made by various agents in the development process.

By focusing on the chain-like nature of the land development process, attention is drawn to the set of factors which influence decisional behavior -- the decision of the predevelopment land owner to sell to a developing agent; the decision of the development entrepreneur to consider the site, purchase and develop it; and the consumer's decision to utilize the finished product. By isolating influences on these decisions which are affected by public policies, the formulation and testing of alternative policy mixes for their effectiveness in promoting desirable land development patterns contiguous to large multipurpose reservoirs.

2.0824, ATLANTIC COASTAL PLAIN - PERMEABILITY DISTRIBUTION STUDY

P.M. BROWN, U.S. Dept. of Interior, Water Resources Division, Raleigh, North Carolina 27607

Examination of sediments along the Atlantic Coast Plain indicates a pulsating sedimentary environment characterized by cyclic transgressive, regressive, and static stages. Determination of some of the axes of the transgressive stages within the basin indicate that they each have a preferred orientation in relation to their position on the flank of the basin. For example, the axis line of a transgressive stage, located in the northwest quadrant, is N. W. E. whereas, the axis line of a transgressive stage, located in the southwest quadrant, is S. W. applies to regressive stages, which,

2. WATER CYCLE

depending upon their location within the mobile basin, have axes that coincide with or that deviate as much as 90° from the axes of related transgressive stages.

The shift in depositional axes results from differential mobility of structures transverse to the long axes of the Atlantic Basin. The objective is to study the depositional controls and environment on a regional scale and relate the depositional controls and environment on a regional scale and relate the depositional history to spatial changes in the primary permeability of successive stratigraphic units.

2.0827, SOD AND STUBBLE MULCH PLANTING - VEGETATION CONTROL

G.C. KLINGMAN, Univ. of North Carolina, Agricultural Experiment Sta., *Raleigh, North Carolina 27600*

Sod planting and stubble mulch planting has the potential of reducing soil erosion, reducing water loss in the form of both runoff and surface evaporation, reducing silting of rivers, streams and dams, making crop production possible on relatively steep, rocky soils not now suitable for crop production. It is believed that the above can be done without sacrificing crop yields.

Feed costs constitute a major cost in the production of beef, dairy and poultry products. With the long growing season found in the Southeast United States, it would appear that the program is especially well suited to North Carolina. Full development of this potential could tremendously increase the south's advantage over the Cornbelt and Northeastern States.

More specifically the objectives are as follows: 1. To synthesize and develop dynamic ecological systems for efficiently producing grain and forage while maintaining continuous soil mulch cover, and 2. To reduce soil erosion and water loss through runoff and evaporation.

2.0829, INTERRELATIONSHIPS OF SOIL PHYSICAL PROPERTIES AND SOIL WATER MOVEMENTS

J.F. LUTZ, Univ. of North Carolina, Agricultural Experiment Sta., *Raleigh, North Carolina 27600*

Determine draw-down patterns of water table by use of electric analogue. Attempt to measure hydraulic conductivity of undisturbed soil cores and relate it to soil properties. Study nature and magnitude of forces holding water films on clays and relate these to hydraulic conductivity.

Description of Work (a) Further work will be done on the effects of phosphate on the colloidal-physical-chemical properties of clays especially on the hydration of the clay particles and on micro aggregation, or flocculation. (b) Soil moisture tension studies will be made on a number of North Carolina soils with emphasis on field capacity and wilting percentage determinations. This will be a continuation of some of the work which has been done during the past year. (c) Soil moisture and bulk density determinations will be made on soils under a number of different cultural management and tillage practices to determine the effects of these different practices upon the properties mentioned.

2.0830, COOPERATIVE RESEARCH PROJECT IN WESTERN NORTH CAROLINA

P.C. SPATH, Univ. of North Carolina, School of Agriculture, *Raleigh, North Carolina 27600*

Research begun in January 1949 to determine water-land relationships for some of the principal soils and important crops used for agricultural purposes in western North Carolina, to provide basic information needed to know how best to utilize these lands for agricultural purposes, with proper consideration for conservation of both land and water resources.

Four watersheds of 3 to 5 acres in area were treated with four different covers rotated under a statistical Latin square design. Covers are improved clover-grass pasture, overgrazed heavily trampled improved pasture, wheat with lespedeza for summer cover, and corn.

Hydrologic determinations are being made to evaluate detailed physical relationships between soils, land use, and water. The effects upon the hydrologic characteristics of the four watersheds under the different covers are being determined. Hydrologic observations include precipitation, surface-water and ground-water runoff, ground-water levels, soil temperature, evaporation, wind velocity, evapotranspiration, dewfall, air temperature, sunshine, and relative humidity.

Electronic computers are used in evaluating equations to determine the significance of hydrologic changes. Detail study of project data is resulting in new concepts of runoff that are proving useful not only for achieving project objectives but also in other hydrologic studies. Results to date are summarized in annual reports. Work is in the twentieth year. Field work has been completed.

Two of the four watersheds were discontinued in 1966 as part of the basic study. One of these was instrumented as part of a short-term but intensive investigation into evapotranspiration and interflow. The two watersheds were instrumented in 1968 as part of an investigation of pesticide dispersion.

2.0831, WEATHER MODIFICATION IN NORTH DAKOTA

A.F. BUTCHBAKER, North Dakota State University, Agricultural Experiment Sta., *Fargo, North Dakota 58102*

2. WATER CYCLE

Objectives: 1. To characterize the climatology of hail storms in southwestern North Dakota. 2. To determine whether seeding convective storms causes a reduction in intensity of hail and impact energy of hailstorms and causes changes in other hail parameters in seeded areas as compared with adjacent nonseeded areas. 3. To determine whether seeding clouds with silver iodide causes a precipitation increase in seeded areas and a possible 'rain shadow' downwind from commercial weather modification areas.

In North Dakota, hail and drought losses amount to about 50% of all Federal Crop Insurance payments for crop losses due to natural hazards. A group of farmers in southwestern North Dakota are seeding storms with silver iodide in an effort to suppress hail. In addition, a weather modification firm seeds clouds in the north-central part of the state for precipitation increase.

Crop loss and precipitation records will be analyzed. Hail impact energy will be determined from dents on aluminum foil. Storm information will be collected from hail indicators, rain gauges, radar data, daily weather maps, and questionnaires. This data will be analyzed to statistically determine the seeding effects.

2.0832, EFFECTS OF GROUNDWATER SEEPAGE ON STREAM REGIMEN

L. CLAYTON, North Dakota State University, State Water Resources Inst, Fargo, North Dakota 58102

The proposed research will be a study of the quantitative and qualitative influence of groundwater seepage pressure on the various erosive and transport characteristics of streams. The research will consist of both laboratory and field studies.

In previous laboratory studies using stream flumes, the influence of groundwater has been largely ignored; many empirical hydrologic relationships have been established in flumes lacking any groundwater control. For the proposed study, two stream flumes with groundwater control will be constructed. The threshold velocity of grain transport with various groundwater seepage pressures in various bed materials will be measured in a small flume with constant cross-section. The relation between seepage and channel characteristics will be observed in a larger flume.

In the field study, the channel and bed-material characteristics of several small drainage basins in western North Dakota will be mapped. These characteristics will be compared with measured groundwater characteristics, including the seepage pressure and the amount and direction of flow. Relationships established in the flumes will be tested in the field streams, and problems encountered in the field will be studied in the laboratory flumes.

2.0833, A LIMNOLOGICAL STUDY OF SPIRITWOOD, NORTH DAKOTA - WATER QUALITY AND SEASONAL CYCLES

G.W. COMITA, North Dakota State University, Graduate School, Fargo, North Dakota 58102

It is proposed to study Spiritwood Lake, N. D. by measuring temperature, transparency, pH, conductivity, and take appropriate water samples for analysis of NH₃, NO₂, PO₄, O₂, Fe and alkalinity, phytoplankton and zooplankton at weekly intervals during the colder part of the year and semi weekly during the warm part of the year. Primary production will be measured at appropriate intervals. An analysis of these data will provide the basis for lake management by the North Dakota State Game and Fish Department for recreational purposes. These data will provide the basis for comparison of the cyclical events in nutrients, phytoplankton and zooplankton between this lake and another much shallower and smaller which sustains similar organisms but less total dissolved solids.

2.0834, DROUGHT INJURY AND RESISTANCE IN PLANTS

K.L. LARSON, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Objectives: 1. To determine the association between plant water stress and various nitrogenous fractions and sulfhydryls in plant parts of alfalfa and barley at different stages of maturity. 2. To determine how and to what degree the water status of plants is (a) related to growth and development, (b) influenced by physical factors of the environment. 3. To determine what stages of growth are most critical for water utilization.

Plants of Vernal alfalfa and Trophy barley will be grown in the greenhouse and growth chambers at low and high plant moisture stresses, initially at uniform temperatures. As moisture stress increases, simulating drought conditions, changes in nitrogenous fractions, RNA and SH groups within the roots and tops of alfalfa and roots, stems and leaves, and grain of barley will be determined by standard biochemical procedures. These determinations will be made at 4 stages of growth. Additional plants will be subjected to drought conditions at various stages of growth to determine the critical times for efficient water utilization. The effect of these moisture stresses on the above constituents will be determined.

SUPPORTED BY U.S. Dept. of Agriculture
North Dakota State Government

2.0835, IRRIGATION AND WATER CONSERVATION

H.M. OLSON, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Location of the Carrington Irrigation Substation is in, and representative of, the area to be irrigated from the Garrison Dam when that project is funded. Water is now obtained by pumping from an aquifer with water quality reasonably comparable to that of the Missouri River. Initial studies are designed to determine the effects of supplemental irrigation on crop production and the possibility of introducing specialty crops not now grown because of inadequate rainfall. Expanded program calls for research on improved irrigation techniques, control of water evaporation, moisture-fertility relationships. As the station program expands, livestock will be incorporated into the research program and a broad study of dryland and irrigation farming involving both crop and livestock production will be developed.

SUPPORTED BY North Dakota State Government

2.0836, THE EFFICIENCY OF WATER USE UNDER VARYING CONDITIONS OF PLANT WATER STRESS

G.E. WILKINSON, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

1. To measure the plant moisture characteristics of selected crops relative to soil moisture conditions. 2. To evaluate the influence of soil and atmospheric environment on plant water stress. 3. To relate plant performance to variations in (a) plant water stress and (b) the soil and climatic environment.

Greenhouse studies will test the methods for evaluating plant water stress. Methods which may be suitable for field use will be related to the energy level of water in the plant. Then barley will be grown in field plots and lysimeters from which evapotranspiration can be measured. Plant leaf sections will be tested periodically to anticipate predetermined plant water stress levels at which water will be applied to the soil. Yields will be related to the water stress history and to soil and climatic conditions under which the crop will be grown to determine the optimum environmental conditions which produce the highest yield per unit of water used.

2.0848, RAINWASH AND SOIL CREEP IN WESTERN NORTH DAKOTA

L. CLAYTON, Univ. of North Dakota, Graduate School, *Grand Forks, North Dakota* 58202

The proposed research involves the field and laboratory investigation of slope processes, of rates of slope erosion, and of the drainage basin characteristics of two drainage areas in the badlands of western North Dakota. The field work will involve the study of types of slope processes, their intensity, their rates, and their relationship to climate and lithologic conditions. Direct observation and observation through time will be made to record changes in landscape features. Procedures to be followed are: 1. Direct observation of slope processes. 2. To observe and study the microclimatic factors of the area, its influence on slope processes, and landform development. 3. To measure rates of hillslope erosion through time. 4. To establish transverse level profiles of valley walls and to record the profile variation through time. 5. To establish permanent photo stations of valley walls. 6. To establish rain gages throughout the drainage basins.

The laboratory work involves a quantitative study of the 'form' factors of the drainage basin following Horton's and Strahler's work. Parameters to be considered are drainage density, stream frequency, hypsometric integral, Horton's number, basin shape, constant of channel maintenance, and ruggedness.

The research will be of importance to future agricultural and conservational projects in this area of North Dakota.

2.0850, LIMNOLOGICAL INVESTIGATIONS OF PRAIRIE POTHOLE

G.A. SWANSON, U.S. Dept. of Interior, Northern Pr. Wlfe. Res. Ctr., *Jamestown, North Dakota*

Objectives: To initiate, on the prairie pothole area of North Dakota, a limnological investigation to study the relationships that exist between organisms comprising the plant and animal communities and their relative contribution to waterfowl production. The initial phase of this investigation will be devoted to developing techniques to sample the varying habitats of prairie potholes.

Procedures: A literature survey will be conducted to compile information on limnological equipment, sampling techniques and previous limnological investigations of waterfowl habitat.

Equipment will be developed to quantitatively sample aquatic invertebrates associated with the benthos, plankton and aquatic macrophytes of prairie potholes.

Statistical procedures will be utilized to determine the sampling intensity required to obtain a precision that is economically feasible. Potholes selected for intensive sampling will be screened by dominant cover type and water chemistry.

Waterfowl will be collected on intensively sampled potholes and their esophageal, proventricular and gizzard food contents will be examined and related to food availability as determined by limnological sampling.

SUPPORTED BY U.S. Dept. of Interior - Bu. Sport Fish.

2.0851, GROUND WATER BASIN DYNAMICS

H.C. PREUL, Univ. of Cincinnati, School of Engineering, *Cincinnati, Ohio* 45221

The specific aim of this research plan is to study the dynamics of ground water basin by mathematical analysis, laboratory studies and field investigations, and to develop methods for the optimum use of the ground water resources in a river basin.

The Great Miami River Basin will be used as a prototype because of its excellent aquifers which are largely recharged by the river.

Over the past several years, extensive studies relative to unsteady ground water recharge have been in progress at the University of Cincinnati in the Division of Water Resources and Hydraulics. In addition, the Division has carried out a number of studies on ground water problems connected with the Great Miami River Basin. The proposed work would utilize this background and develop it into a form which may be applied to any river basin.

Laboratory and field data which are presently available will be used in the development of models for representation of dynamics of a ground water basin.

Final results will be provided in three forms for optimum use of ground water basin. 1. A general mathematical model for basin dynamics. 2. A general digital computer program for ground water basin dynamics. 3. An electric analog model for ground water dynamics in the Great Miami River Basin; general information will be included so that others may use this model as a pattern for other basins.

2.0853, EFFECT OF WATER APPLICATIONS TO SOD AND MULCH UPON QUALITY ATTRIBUTES OF APPLE FRUITS

C.W. DONOHA, Ohio State University, Agricultural Experiment Sta., *Columbus, Ohio* 43210

Objectives: (1) To ascertain the effect of water applications to apply trees /// in sod and mulch upon growth, yield and certain quality attributes of the fruit deemed of greatest market acceptability; (2) to ascertain the effect of such treatments upon certain biochemical constituents of the fruit; (3) to assess the nutritional status of leaves and stems with particular reference to the extent to which they are qualitatively affected by changes in the water status of the tree; (4) to ascertain the effect of water applications upon certain major physiological processes occurring in leaves and stems; (5) to determine the effect of such water application on physiological disorders of the fruit and on length of acceptable storage life.

Description of work proposed: Water will be applied by sprinklers to the soil beneath apple trees established in sod and mulch when the available moisture at the 6-18' depth has been

2. WATER CYCLE

reduced by 40 and 60 percent. The effect of such applications as compared with those treatments to which no water has been applied will be recorded in terms of tree and fruit growth, certain biochemical constituents of the leaves, stems and fruits as well as on the rate of photosynthesis and respiration at appropriate intervals during the season. Special attention will be given to the effect of water treatments upon certain fruit quality attributes and storage behavior in view of the emphasis given in this project to this aspect.

2.0854, STRONTIUM ISOTOPE COMPOSITION AND TRACE ELEMENT CONCENTRATIONS IN LAKE HURON AND ITS PRINCIPAL TRIBUTARIES

G. FAURE, Ohio State University, Graduate School, Columbus, Ohio 43210

Concentrations of the major cations: Na, K, Ca, and Mg and Sr were determined for 64 samples of surface water from Lake Huron and for 17 of its major tributary rivers. For addition, isotopic compositions of strontium were measured for 30 samples of lake water and for 13 of the tributary rivers. Concentrations of dissolved iron and total phosphorous were determined for a small suite of lake and river water.

The data documents important differences in the chemical composition of water discharged into Lake Huron by Lake Superior, Lake Michigan and tributary rivers. These differences are related to differences in the chemical and mineralogical composition of the bedrock underlying the Great Lakes drainage basin.

The strontium contributed to Lake Huron by water draining the Canadian Shield along its northern shore is enriched in radiogenic Sr87. The average Sr87/Sr86 ratio is 0.718. The rivers draining sedimentary rocks of Michigan and southwestern Ontario contribute strontium whose isotope composition is similar to that in the modern oceans and has a Sr87/Sr86 ratio of 0.710.

A geochemical model is presented which attempts to represent the chemical composition of water in Lake Huron as a mixture of the different types of water discharged by different sources.

2.0855, EFFECTS OF TREE ROOTS ON HYDRAULIC CONDUCTIVITY AND POROSITY OF FOREST SOILS IN THE ALLEGHENY-CUMBERLAND PLATEAU

N. HOLOWAYCHUCK, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

The objectives are to develop techniques for (1) measurement of void size and distribution and (2) the determination of soil density differences with distance from the void or root channel in undisturbed forest soil samples. Such techniques would make it possible to determine the sizes, quantity, and distribution with depth of voids and channels through which free water may move in forest soils. The research will be directed to (1) developing techniques for taking of blocks of forest soils in which the roots and the soil will not be disturbed and (2) methods of preparation of thin sections of these blocks of soil for examination under a microscope in the laboratory.

SUPPORTED BY Ohio State Government

2.0856, GLACIOLOGY AND METEOROLOGY OF ANVERS ISLAND, ANTARCTICA

R.A. HONKALA, Ohio State University, Graduate School, Columbus, Ohio 43210

During 1967 Antarctic winter Honkala, the P.I., and Whillans, his Research Associate, carried out the field glaciological and meteorological research portion of this project on Anvers Island, in the vicinity of Palmer Station, Antarctica, under GA-747. The field research consisted primarily of (1) glaciological observations of snow accumulation, snow and ice ablation, and surface ice movement; (2) further topographic and geodetic control for the construction of base maps of the research area; (3) geophysi-

cal observations of the gravity field on the Anvers Island Ice Cap to help determine the thickness of the ice and the shape of the data at Palmer Station and at an inland site, heat-budget studies on the ice surface, and wind-speed measurements.

These data will be reduced and analysed at O.S.U. by Honkala and Whillans to help determine the best balance and mass balance, as well as the dynamics of the Anvers Island Ice Cap.

No further Antarctic field work is contemplated.

2.0857, DROUGHT INJURY AND RESISTANCE IN PLANTS

H.J. MEDERSKI, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

Objectives: (1) To develop field and laboratory methods for measuring the water stress of plants.

(2) To determine how and to what degree the water status of plants is (a) related to growth and development, (b) influenced by physical factors of the environment.

Description of Work: Greenhouse and laboratory studies will be

conducted to further develop and refine the beta gauging technique

for monitoring internal plant water potential. Distribution of plant water potentials within time and space will be made and used as a basis for applying the gauge for monitoring water stress.

Plant factors affecting the relation between beta ray attenuation

and tissue water potential will be investigated.

Greenhouse studies of the relation of photosynthesis and growth to internal plant water stress will be made to determine the critical internal plant water stress level for various aspects of growth and processes affecting growth.

2.0858, CONTINUATION OF GLACIOLOGICAL INVESTIGATIONS ON THE CASEMENT GLACIER, ALASKA

D.N. PETERSON, Ohio State University, Inst. of Polar Studies, Columbus, Ohio 43210 (AT(11-1))

The purpose of this study is to determine the rate of burial and the trajectory of a given point on the surface of a typical temperate glacier, and to determine the date of its exposure at the lower end of the glacier. To accomplish this, an assessment is being made of the surface velocity and of the mass balance of the casement Glacier in order to better understand the factors upon which these parameters depend.

Objectives: (1) To assess the mass balance by measurement of annual accumulation, ablation, and surface velocity. (2) To determine the trajectories of points on the surface of the glacier by using a formula developed by J. F. Nye. (3) To examine the ice at the bottom of the glacier in order to better understand the mechanisms of the sliding of a glacier on its bed. (4) To establish meteorological stations at various elevations on the glacier and on the rock adjacent to the glacier in order to relate the ablation studies to the meteorological conditions.

2.0859, FLOW ANALYSIS OF HYDRAULIC CONNECTORS IN ARTIFICIAL RECHARGE SYSTEMS

W. PETTYJOHN, Ohio State University, Water Resources Center, Columbus, Ohio 43210

The specific aim of this research plan is to study flow systems of water injected into the subsurface through hydraulic connectors by laboratory and mathematical methods.

Over the past three years, studies relative to the design have been in progress in the Water Resources Division of the U.S. Geological Survey. However, the flow systems associated with hydraulic connectors have not been studied and are of considerable importance for determining proper artificial recharge system designs.

2. WATER CYCLE

Laboratory and field data that are presently available will be used to build a laboratory model for representation of the dynamics of an artificial recharge system that consists predominantly of hydraulic connectors. Standard hydraulic formulas will be used to form a mathematical model. Results of the two means of analysis will be correlated, modified if necessary, and used to determine a formula that describes the optimum hydraulic connector size and spacing under conditions of uniform permeability.

2.0860, EFFECTS OF SOIL MANAGEMENT TREATMENTS ON ERODIBILITY AND INFILTRATION CHARACTERISTICS

B.L. SCHMIDT, Ohio State University, Agricultural Experiment Sta., Columbus, Ohio 43210

1. To determine infiltration characteristics for typical Ohio soils. 2. To investigate the factors affecting the relative erodibility of major Ohio soils. To study under controlled, simulated rainfall, the effects of raindrop impact energy and initial surface conditions on the formation of soil surface seals, and the characteristics of these surface seals on various Ohio soils. 4. To study, under field conditions, the effects of soil management treatments on soil surface conditions, and the relationships to water intake and soil loss rates.

Field infiltration data will be collected on three typical Ohio soils using the Purdue sprinkling infiltrometer in accordance with the procedures of Regional Research Project NC-40. After adoption of desirable modifications, further studies will be made on other major Ohio soils. Soil survey data from statistical quarter-section samples will be summarized by soil type, slope group and degree of erosion to calculate average weighted erosion indices for major Ohio soils. The susceptibility to surface sealing on these soils under different surface conditions will be studied under simulated rainfall of known energy, as well as the characteristics of these seals and their relationships to erosion and infiltration. Field experiments will be conducted on the effects of tillage and soil surface conditions on sealing, erosion, and water intake and losses.

2.0861, HYDROLOGIC INVESTIGATION OF WATERSHEDS IN OHIO

E.P. TAIGANIDES, Ohio State University, School of Agriculture, Columbus, Ohio 43210

The objective of this investigation is to acquire the knowledge necessary in the development and application of mathematical models to simulate the hydrologic phenomenon associated with small agricultural watersheds in Ohio.

The initial phase of work will involve a review of the current mathematical watershed models and a selection of the more successful models to apply to Ohio watershed. Both Analog and Digital Computer versions will be considered.

A prime objective will be to modify the Stanford Streamflow Simulation Model, through the use of the excellent collection of data available at the Coshocton Ohio Hydrologic Station, in order to predict small watershed response.

Secondary objectives will encompass investigations of the Influence of Land Use on Runoff and the Hydrologic Response of Strip-mined Areas.

The culmination of these studies will be a mathematical model, that would predict water yield peak runoff, outflow hydrographs, and residual soil moisture conditions, for inputs consisting of readily obtained basin characteristics and given precipitation sequence.

Use will be made of the \$30,000 Analog Computer in the Agricultural Engineering Dept. as well as the University's 7094/360 Digital Computer facilities.

2.0863, MANAGEMENT OF STORM RUNOFF AND THE IMPROVEMENT OF WATER YIELD ON FOREST LAND

R.Z. WHIPKEY, U.S. Dept. of Agriculture, Columbus, Ohio

Object: To devise ways to manage stormwater runoff and improve the amount, timeliness, and quality of water arising from forest land in the Allegheny, Cumberland plateau and related limestone, sandstone, shale and loessial regions of the Midwest.

Plan of work: This project is concerned primarily with forest soils and the movement of water through them. The staff is measuring subsurface stormflow movement and hydraulic conductivity rates through forest soils. They are also determining the effect of subsoiling and mulching on water movement; the relation of soil moisture to distance from planted coniferous trees; and the characteristics of a coniferous plantation related to tree growth and available water.

SUPPORTED BY U.S. Dept. of Agriculture

2.0864, SEDIMENT SOURCES AND YIELDS IN AGRICULTURAL WATERSHEDS IN CORN BELT STATES

L.L. HARROLD, U.S. Dept. of Agriculture, Coshocton, Ohio

Object: To develop procedures for predicting the sources and amount, rate, and character of sediment yield in the principal physio-graphic and climatic regions.

Plan of Work: Information on quantities of sediment carried by streams is obtained by means of reservoir sedimentation surveys and through suspended load sampling on selected watersheds. Records of precipitation, runoff, topography, channel characteristics, soils and geology, land use, conservation practices, and watershed treatment measures are compiled for the areas for which sediment yield records are available. Studies are made to determine and evaluate the processes and rates of erosion on land surfaces including gullies, roadbanks, and stream channels. Radioactive elements and other tracers are used in studying the movement of sediment from erosional sources to points of deposition. Required instrumentation is developed. Data on sediment yield rates and associated causal factors are analyzed and interpreted to derive improved techniques and equations for estimating sediment yield and sources in ungaged watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

2.0865, PRECIPITATION AND SNOW MELT CHARACTERISTICS INFLUENCING RUNOFF FROM WATERSHEDS IN CORN BELT

L.L. HARROLD, U.S. Dept. of Agriculture, Coshocton, Ohio

Object: To (1) develop information on amounts, duration, areal and seasonal distribution storm paths and other characteristics of rainfall as affected by geographic location, topographic location, and other factors in relation to runoff from agricultural watersheds; (2) evaluate the factors influencing the disposition of snow and to develop improved methods of estimating stream discharges and water yields for upstream watersheds where the supply is from snow melt; and (3) determine the relationship of frozen soils to runoff from melting snow or rain.

Plan of Work: Studies are currently in progress at the North Appalachian Experimental Watershed near Coshocton, Ohio and

2. WATER CYCLE

on agricultural watersheds in the vicinity of Council Bluffs, Iowa, Fennimore and Madison, Wisconsin, Iowa City, Ia., and Columbia Mo.

SUPPORTED BY U.S. Dept. of Agriculture

2.0866, RUNOFF PRODUCTION BY UNIT SOURCE AREA AGRICULTURAL WATERSHEDS IN CORN BELT STATES

L.L. HARROLD, U.S. Dept. of Agriculture, *Coshocton, Ohio*

Object: To evaluate quantitatively, as one of the important factors in predicting runoff from ungaged watersheds, the runoff producing potential of the major individual soil-cover complexes under typical conditions of use and treatment.

Plan of Work: Studies are currently in progress at the Northern Appalachian Experimental Watershed near Coshocton, Ohio; Columbia, Missouri; and in the vicinity of Council Bluffs, Iowa. Particular attention is being given to investigations of inter-flow in soil profiles.

SUPPORTED BY U.S. Dept. of Agriculture

2.0867, RELATION OF CLIMATIC AND WATERSHED FACTORS TO STORM RUNOFF IN CORN BELT STATES

L.L. HARROLD, U.S. Dept. of Agriculture, *Coshocton, Ohio*

Object: To identify the climatic and watershed factors influencing the magnitude and frequency of storm flows from agricultural watersheds; to evaluate the factors quantitatively; and to develop procedures by which the magnitude and frequency of storm flows from ungaged watersheds may be estimated.

Plan of Work: Work is currently concentrated on North Appalachian Experimental Watershed near Coshocton, Ohio; on agricultural watersheds in the vicinity of Fennimore and Madison, Wisconsin; Columbia, Missouri, and Council Bluffs, Iowa. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape and other geomorphic attributes of watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

2.0868, RESERVOIR SEDIMENTATION STUDIES IN CORN BELT STATES

L.L. HARROLD, U.S. Dept. of Agriculture, *Coshocton, Ohio*

Object: To obtain an understanding of reservoir sedimentation phenomena, to develop better procedures for predicting such processes, and to develop better design criteria for reservoirs--including knowledgeable consideration of: (1) characteristic rates of storage depletion by filling of reservoirs with sediment, as affected by various parameters in the principal physiographical and geomorphological regions; (2) volume-weight of deposited sediment; (3) reservoir trap efficiency; and (4) distribution of reservoir sediment.

Plan of work: Primarily field investigations to develop improved procedures for making reservoir sediment deposition surveys; distribution of sediment in floodwater detention type reservoirs; and volume weight of reservoir sediment from measurements with the gamma probe.

SUPPORTED BY U.S. Dept. of Agriculture

2.0869, SOIL MOISTURE REGIMES OF AGRICULTURAL WATERSHEDS IN CORN BELT STATES

K.E. SAXTON, U.S. Dept. of Agriculture, *Coshocton, Ohio*

Object: To determine for agricultural watersheds: basic information on amounts, accretion and depletion, areal and depth of distribution, and the transmission of soil moisture; criteria for the design of sampling programs to define soil moisture within prescribed limits of accuracy; and methods for predicting soil moisture for ungaged areas.

Plan of Work: The work is currently in progress at the North Appalachian Experimental Watershed near Coshocton, Ohio; on watersheds in the vicinity of Fennimore and Madison, Wisconsin;

in the vicinity of Council Bluffs, Iowa; and at Columbia, Missouri. Patterns of soil moisture extraction and recharge are determined for different land use and soil conditions including investigations to establish criteria for determining soil moisture status on a watershed basis.

2.0870, NITROGEN FERTILIZATION AND IRRIGATION OF TOBACCO

T.G. ARSCOTT, Ohio Agric. Res. & Dev. Ctr., *Wooster, Ohio* 44691

1. To determine the effect of irrigation on stand and early growth of newly transplanted tobacco. 2. To study the effects of irrigation on yield and quality of tobacco grown at four nitrogen levels. 3. To determine the effect of soil moisture stress at various stages of growth on yield and quality of tobacco.

This experiment is designed to determine the response of tobacco to nitrogen fertilization under various soil moisture conditions. Other objectives are to determine the effects of irrigation on stand and early growth of newly transplanted tobacco and the effect of soil moisture stress at various stages of growth on tobacco production.

Four levels of nitrogen fertilization from 0 to 180 pounds of N per acre are compared at three soil moisture levels. The design is a split plot with three replications. The tobacco is irrigated with a sprinkler type irrigation system. One irrigation level is maintained at 60 percent of available moisture, the second is irrigated only at critical periods during growth, and the third level receives only normal rainfall. Yield, quality, value, and chemical analyses of the leaf are determined. The tobacco is grown in a three year rotation.

SUPPORTED BY Ohio State Government

2.0871, FLOW OF COLLOIDAL SUSPENSIONS IN POROUS MEDIA

R.B. CURRY, Ohio Agric. Res. & Dev. Ctr., *Wooster, Ohio* 44691

To investigate the fundamental principles underlying the flow of colloidal suspensions into or through porous media.

Description of work: The scope of this study will include the use of several granular materials and suspensions of colloidal materials. Initially, carborundum will be used as the porous media and Wyoming bentonite as the suspended material in order that there will be continuity between the present work and past studies. Materials to be used later will include chemically active materials such as zeolite, natural occurring materials, such as soils and filter sands. The natural occurring materials will be used to tie this basic study to practical applications in the field.

Both the porous media and the suspended materials will be characterized completely by determination of various physical and chemical properties.

The granular material will be placed in a permeameter for testing. The actual test procedure will involve four phases: (1) initial flow of de-aired, de-ionized water through the porous media in the permeameter, (2) followed by the introduction of the suspension into the permeameter in order to determine the effect of the suspension flow in the system, and (4) the amount of colloidal material retained in the column of porous media is determined by the use of radioactive isotope techniques.

2.0872, IRRIGATION REQUIREMENTS OF FIELD AND HORTICULTURAL CROPS

R.B. CURRY, Ohio Agric. Res. & Dev. Ctr., *Wooster, Ohio* 44691

Irrigation Requirements and Potentials of Field and Horticultural Crops: 1. To determine the water requirements and evapotranspiration rates of field, fruit, vegetable, and nursery crops. 2. To evaluate the long-time response of these crops to irrigation on fine-textured and coarse-textured soils. 3. To evaluate the drought potential of major soils from long-time weather data and to correlate this information with crop response. 4. To apply the information on evapotranspiration rates and water require-

2. WATER CYCLE

ments to the development of design criteria for distribution and application systems for irrigation of these crops. 5. To evaluate the effect of irrigation on drainage system design in fine-textured soils.

Description of Work: The study will cover the investigation of the water requirements and evapotranspiration rates of various field and horticultural crops. Initial studies will be made with a neutron meter. Water application will be initially by overhead sprinklers. Surface methods of irrigation will be investigated. Yield and quality, as determined by co-operating personnel in the particular product area, will be used as the measure of response to irrigation. It is also envisioned that studies under controlled climatic conditions may be needed to provide the desired information. The drought potential of major soils in the state will be evaluated from an analysis of long term weather records. The effect of irrigation on drainage system design in fine-textured soils will be determined by a comparison of the behavior of drainage systems under irrigated and non-irrigated conditions.

2.0875. RUNOFF PRODUCTION BY UNIT SOURCE AREAS IN THE SOUTHERN PLAINS

M.A. HARTMAN, U.S. Dept. of Agriculture, Chickasha, Oklahoma

Object: To evaluate quantitatively the runoff producing characteristics of the major soil-cover complexes in the Southern Plains under typical conditions of use and treatment.

Plan of work: The studies are currently in progress on single-soil-cover watersheds in the vicinity of Chickasha and Cherokee, Oklahoma; and Riesel and Sonora, Texas. Correlations are established between the physical characteristics, soils and their runoff producing potential under a variety of land use and treatments.

SUPPORTED BY U.S. Dept. of Agriculture

2.0876. WEATHER RADAR - PRECIPITATION RELATIONSHIP

K.E. WILK, U.S. Dept. of Commerce, Natl. Severe Storm Lab., Norman, Oklahoma

Tech. Obj. changes in precipitation intensity patterns which accompany transitory weather systems. To determine the quantitative significance of radar signal return from precipitation in terms of precipitation rate, liquid water content, and other meteorological parameters. To determine the minimum number of parameters needed for characterizing the echo element important for forecasting and communicating precipitation data.

Approach: A standard WSR-57 weather radar has been equipped with data recording equipment to provide systematic

weather echo recording. Rain-gage data from USDA mesonet-work is assembled and tabulated. Radar and rain-gage data are processed using semi-automatic and computer programs to prepare precipitation radar echo statistics.

Progress: Computer programs had been written to process the data and several years of data have been collected.

2.0878. SOIL SURFACE MANAGEMENT PROCEDURES FOR SOIL AND WATER CONSERVATION

J.M. DAVIDSON, Okla. St. Univ. of Agr. & Sci., Agricultural Experiment Sta., Stillwater, Oklahoma 74075

Objectives: 1. Replace or eliminate as many mechanical tillage operations as feasible for an annual wheat, cotton or sorghum program. 2. Measure water storage efficiency of the soil profile under various surface management practices. 3. Evaluate changes in organic matter, bulk density, aggregation and residue in surface soil owing to various tillage practices. 4. Determine annual operational cost of each soil management techniques for cost plus yield analysis.

Procedure: Treatment for weed control, both during and between growing seasons, will vary from complete mechanical to all chemical with intermediate combinations of the two. Water storage in the soil profile will be monitored frequently during the year using the neutron meter. These values will be compared with annual precipitation and consumptive-use measurements. Particular attention will be given to water retention in the top 18 inches of the soil under the various tillage practices. Field work involving evaporation from bare soil will be supplemented with laboratory work. After harvest each year, samples in the top 18 inches of the soil will be collected to measure organic matter, bulk density, aggregation, chemical residue and general conditions of the soil. This information along with the amount of plant residue on the soil surface will be used to estimate physical and chemical property changes of the soil. Cost per unit of yield will be made for each crop and crop program in order to compare mechanical and chemical methods of weed control.

2.0879. OVERLAND FLOW ANALYSIS FOR A SIMULATED VEGETATED SURFACE

C.E. RICE, Okla. St. Univ. of Agr. & Sci., School of Agriculture, Stillwater, Oklahoma 74075

The objectives of this project will be: 1. To determine the functional relationship between watershed roughness (expressed as some appropriate friction factor such as Manning's n) and the depth of flow, rainfall intensity (raindrop impact), and slope of surface profile for a simulated vegetated surface for spatially varied steady flow and spatially varied unsteady flow (overland flow). 2. An analysis of overland flow using the continuity and momentum equations as the expressions to completely define the time distribution of runoff (hydrograph) from a simulated vegetated surface. 3. Adjustment of the friction factor in the friction slope of the equations until the predicted hydrographs duplicate the experimentally determined hydrographs. This should permit determination of the actual friction factor relation-

2. WATER CYCLE

ship for the different variable combinations of overland flow from a simulated vegetated surface.

The experiment data will be obtained using a 44-foot variable slope rectangular flume. The flume is about 17 inches wide and will be lined with an artificial grass substance (trade name of PERMA-GRASS) that should approximate a close growing mat type grass such as bermuda. The lateral inflow, designed to approximate natural rainfall, will be applied by spray nozzles located along the longitudinal axis of the flume. Rainfall rates of 2 in. per hour, 4 in. per hour, and 6 in. per hour will be studied.

2.0880, STUDIES OF THE SOIL-MOISTURE-PLANT REGIME FOR THE CONDITIONS OF WESTERN OKLAHOMA

J.F. STONE, Okla. St. Univ. of Agr. & Sci., Agricultural Experiment Sta., Stillwater, Oklahoma 74075

Objectives: 1. To use Oklahoma weather data in establishing probability values for rainfall. 2. To establish an evapotranspiration equation for Oklahoma through use of weather summary data and evaluation of equation parameters involved, and further, to establish a satisfactory means for estimating the total need for water for crop growth. 3. To study the influence of plant and soil factors on water intake by roots and the subsequent transpiration. 4. To study the efficiency of precipitation in the production of plant growth and use this as a yardstick for water efficiency in dryland areas. 5. To study maximization of water-use-efficiency for irrigation agriculture in Oklahoma.

Procedure: Rainfall probabilities at several stations across the state will be characterized through the year. Weather and ground conditions related to water loss will be studied. The factors and parameters concerned will be used in establishing evapotransmission equations for Oklahoma. Laboratory and field studies will be made to establish the relations between physiological conditioning of the plant and water loss to environmental demands. Electric analog procedures are planned to study movement through the plant. Effects of bedding, water impermeable barriers and vertier wetting on water-use-efficiency will be studied.

Oklahoma State University

2.0882, SEDIMENT PRODUCTION, MOVEMENT, AND DEPOSITION IN WATERSHEDS IN THE SOUTHERN GREAT PLAINS

W.O. REE, U.S. Dept. of Agriculture, Stillwater, Oklahoma

Object: To develop procedures to predict the sources, amount, rate and character of sediment yield and delivery from agricultural watersheds of varying sizes; develop design criteria and other information on trap-efficiency, density and distribution of sediment, and characteristic rates of storage depletion by silting for reservoirs and ponds affected by watersheds; and to determine the effects of upstream watershed protection programs on sedimentation along the main stem of river systems.

Plan of Work: The sediment transport in selected streams is measured and sediment yields related to causal factors. The effect of watershed treatment on the sediment delivery to major streams is studied. Transport load is measured, and records made of precipitation, runoff, topography, channel characteristics, soils and geology, land use and cover, and conservation practices and watershed treatment. Information on reservoir sedimentation is obtained, including characterization of the contributing basins, measurement of water and sediment inflow, outflow, and movement; characterization of basins as to shape and size, and capacity-watershed ratios; variations in the density and texture of deposited sediment and processes of delta formations within basins and their extension upstream beyond the backwater of the reservoir.

2.0883, CLASSIFICATION OF DEEP SUBSURFACE WATERS BY CHEMICAL COMPOSITION AND GEOLOGY

P.A. DICKEY, Univ. of Tulsa, Graduate School, Tulsa, Oklahoma 74104

This is a renewal of NSF Grant GP-5051. Data from deep oil and gas wells indicate that there is a normal increase in salinity of subsurface water with depth to a certain point, below which the relationship no longer holds and the waters are less concentrated. In the same areas and at about the same depths it has been shown that shales are under-compacted. The normal processes of compaction and expulsion of water have apparently been arrested by normal faults which were active during sedimentation, and which interrupted the paths of water migration along the bedding planes. The pressures in the interstitial water in under-compacted shales approach the weight of the overburden.

To establish these interesting relationships it will be necessary to choose several oil fields whose geology and pattern of reservoir pressures are well known. Water samples will be especially collected and the U.S. Bureau of Mines has agreed to supply chemical analyses. It is expected that much entirely new information on both physical and chemical processes of diagenesis and on tectonics will be obtained.

2.0884, A RUN TIMING STUDY IN THE LOWER COLUMBIA RIVER BY MEANS OF A TESTFISHING PROGRAM

A. OAKLEY, State Fish Commission, Clackamas, Oregon 97015

This program is conducted to determine the time of migration of spring-run chinook salmon through the lower Columbia River and provide a means of estimating the size of the population. The program is conducted at two sites. Fish Commission personnel supervise fishing operations at Woody Island, which is 28 miles above the mouth of the Columbia River, while the Washington Department of Fisheries is responsible for conducting the fishing at Corbett located 22 miles below Bonneville Dam. Gill nets are drifted over a standard area on alternate days at each site. Fish captured in suitable physical condition are tagged and released, and later observed at various fishways, hatcheries, and in spawning tributaries. Stream of destination, migration rates, and growth patterns as determined by scale analysis are also learned from this work.

2.0885, PREDICTION OF WATER MOVEMENT IN UNSATURATED SOILS

L. BOERSMA, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: To devise and test methods for predicting water transmission characteristics from measurable soil properties for known temperature conditions.

Work Proposed: Previous work done at the Oregon station has indicated that numerical techniques based on the diffusion equation can be used to predict unsaturated water movement. The accuracy of the prediction depends upon the ability to establish the exact relationship between transmission charac-

2. WATER CYCLE

teristics and moisture content. Soil columns will be packed for the determination of the relationship between the soil-moisture diffusivity and the soil moisture content. The columns will be made up of soils of predetermined mineral composition, apparent density and texture. The range of soil textures to be studied will be selected such that the relationship between texture and diffusivity can be accurately described and possibly predicted.

2.0886, WATER-SOIL PLANT RELATIONS

L. BOERSMA, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: Investigate relationships between water stress in root medium and internal water status of plants as affected by environment and plant development.

Description of Work: The initial work is to develop on a practical basis a method to maintain a constant moisture content in a body of soil in which plants are growing. The study will then proceed with studies of the quantitative effects of different air temperatures, relative humidities, soil temperature and soil moisture tensions on growth and transpiration. Additional work will attempt to evaluate the link between moisture stress and ion uptake and between transpiration and ion uptake.

2.0887, CHARACTERIZATION OF WATER TABLES IN OREGON SOILS WITH REFERENCE TO TRAFFICABILITY

L. BOERSMA, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

(a) Quantitatively describe and compare the water-table regimes of selected Oregon soils to determine whether particular water-table regimes are associated with specific soil types. (b) Study the relations and associations of soil morphological characteristics, soil moisture regimes, soil trafficability, and other static and dynamic features of soil, terrain, and weather to water-table regimes of the several soils to achieve the capability for appraising water-table regimes from morphological information. (c) To gain background knowledge needed in development of prediction methods for water-tables, soil moisture, and trafficability strength.

Instruments and techniques have been developed for measuring the trafficability characteristics of soils by USA-WES, Vicksburg, Miss. Capabilities for estimating trafficability conditions without the opportunity to measure them and for predicting changes in conditions with time are also needed. Three near-model test sites will be established on each of five soil series of the Willamette Catena in Western Oregon. Sites will be designed and instrumented to allow the collection of data satisfying the needs for fulfilling the stated objectives. The data-collection phase of the program will last for a period of one year after which the following information will have been obtained. (a) Daily records of air temperature, rainfall, water-table depth, soil moisture at several depths, and pertinent changes in vegetation, soil conditions, etc. (b) Data for developing trafficability strength-soil moisture relations. (c) Complete descriptions of soil physical properties, soil morphological features, and terrain features, (d) Other data necessary for the completion of research studies by OSU graduate students who are directly associated with the program.

2.0888, IRRIGATION FEASIBILITY ON THE DAYTON, AMITY, WOODBURN, WILLAMETTE AND RELATED SOILS OF THE WILLAMETTE VALLEY

L. BOERSMA, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1. To determine the suitability and the production potential of selected crops under irrigation on the Dayton, Amity, Woodburn, Willamette and related soils of the Willamette Valley under different levels of management. 2. To determine the

irrigation water requirement of selected crops grown on the above named soils under different systems of management. 3. To determine the economic feasibility of irrigation based on the results obtained under objectives 1 and 2.

Description of Work Proposed: A range of promising crops will be grown under different management and cultural practices in replicated field experiments to assess their production capacity under irrigation. The main variables in the experiments will be frequency and amount of irrigation, fertilizer application, date of planting and stand density. Experiments will be included to evaluate different soil management practices in relation to the production of crops on these soils. Water usage, yield, and in some cases quality of the product will be measured. In addition a range of crops will be grown in an exploratory manner to obtain an indication of the suitability of specific crops to production under irrigation on these soils. The crops which appear most promising may be further explored in some comprehensive experiments.

2.0889, THE PREDICTION OF UNSATURATED FLOW RATES FROM PHYSICAL PROPERTIES OF THE POROUS MEDIUM

L.L. BOERSMA, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

The development of the unsaturated flow theory leads to the determination of several parameters necessary for the prediction of water movement in porous media. Little investigation has been done to determine these parameters as a function of easily measured physical properties of the medium. The flow parameters have been related to characteristic functions obtained from experiments. The theory has been successful in some cases under special conditions. When experimental data do not match with the values predicted using the characteristic functions, only assumptions about the discrepancies between theory and experience can be presented. The objective of the proposed study is to establish a relationship between water transmission coefficients and properties of the porous medium by a series of systematic measurements performed on a range of materials.

The need for fundamental information about unsaturated flow parameters obtained in a systematic manner is urgent. Unsaturated water movement is a basic aspect of many studies related to water treatment, movement of chemicals (pesticides) and movement of water as part of the hydrologic cycle. This project was initiated in fiscal 1966 and will be completed in 1969.

2.0890, UNSATURATED FLOW RATES

L.L. BOERSMA, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

1. To establish a relationship between water transmission coefficients and soil physical properties by a series of systematic measurements. 2. To compare values of water transmission coefficients calculated from pore size distributions with experimentally obtained values. 3. To establish the possible use of a mercury intrusion porosimeter as a tool for a fast and routine measurement of pore size distribution.

The development of the unsaturated flow theory leads to the determination of several parameters necessary for the prediction of water movement in porous media. Little investigation has been done to determine these parameters as a function of easily measured physical properties of the medium. The flow parameters have been related to characteristic functions obtained from experiments. The theory has been successful in some cases under special conditions. When experimental data do not match with the values predicted using the characteristic functions, only assumptions about the discrepancies between theory and experience can be presented. The objective of the proposed study is to establish a relationship between water transmission coefficients and properties of the porous medium by a series of systematic measurements performed on a range of materials.

2.0891, A CLASSIFICATION OF THE LAKES OF THE STATE OF OREGON

J.R. DONALDSON, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

The primary objective of the proposed research is to begin an accurate appraisal of the quantity and quality of the lakes of the State of Oregon in order to document for posterity the existing conditions and to serve as an aid to the present and future water use manipulations.

The specific project objectives are as follows: (1) Assemble information presently available concerning the lakes of the State of Oregon. (2) Begin to sample selected lakes by differing geological areas and/or drainage basins in order to accumulate limnological data essential for a statewide classification. (3) Set up a format for recording and processing the collected information with the eventual purpose of making the results available in published form. The field work will involve the collection of information on the morphological features, thermal and optical properties, major chemical features (oxygen, pH, alkalinity, major cations, total solids and specific conductivity) and the qualitative and quantitative features of the biota of each lake visited.

Oregon State University

2.0892, HYDROLOGY OF WATER YIELD PREDICTION

J.T. KRYGIER, Oregon State University, Water Resources Research Inst., Corvallis, Oregon 97331

Object: To predict water yields from meteorological parameters for watersheds composed of heterogeneous vegetation, and to measure changes in water yield caused by logging.

Plan of Work: The long-range goals of the project will be to estimate measured water budgets on plots and watersheds for meteorological parameters. Small watersheds will be utilized in the Coast Province for prediction purposes and to observe the magnitude of change in water yield caused by clearcut logging.

Water budget measurements will be made weekly or biweekly throughout the year on plots of Douglas fir and oak near Corvallis. Freely fluctuating plots and two functioning as open-ended lysimeters will be utilized. The measurements will consist of gross rainfall, net rainfall, soil moisture change (neutron probe) and measured unsaturated flow. The latter will be organized as a separate research project. Water budgets on the plots will be estimated from incoming solar radiation, net radiation and air temperature, as measured above the forest stands.

The watersheds are located in the coast range approximately 60 miles west of Oregon State University at Corvallis.

Oregon State University

2.0893, SEASONAL WATER USE BY FOREST VEGETATION

J.T. KRYGIER, Oregon State University, Graduate School, Corvallis, Oregon 97331

Objectives: The overall purpose is to establish the role of foliage transpiration in causing water loss from streamflow or loss of soil water available for growth and survival of plants. Determination of comparative uses by important local forest vegetational species especially trees during the four seasons of the year will be attempted. Amount of use will be related to soil and air temperature, air humidity, rainfall and solar radiation.

Assessment of the water economy for important forest species will allow interpretation of their effect on flood peaks and low water levels. Control of cover species on a watershed offers one means of controlling quality, quantity and regularity of stream waters.

SUPPORTED BY Oregon State Government

2.0894, TESTS OF DOUGLAS-FIR PLANTING STOCK FOR SURVIVAL UNDER DROUGHT STRESS

D.P. LAVENDER, Oregon State University, Graduate School, Corvallis, Oregon 97331

Objectives: 1. To examine the physical and physiological characteristics of root systems of seedlings growing on unfavorable sites. 2. Establish techniques for identifying drought resistance.

Description of Work Proposed: Work with seedlings from Provenance Study. Study seedlings taken from severe sites. Study parents of seedling growing on droughty soils. Work with Ernest Wright on mycorrhiza and its relationship to survival on difficult sites.

SUPPORTED BY Oregon State Government

2.0895, VEGETABLE CROPS FERTILIZER, PLANT NUTRITION, AND IRRIGATION PROBLEMS

H.J. MACK, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

(1) To evaluate the effect of fertilizers and lime on growth, yields, and quality of major vegetables grown in Oregon (2) to relate the growth and yield response from fertilizer and lime treatments to chemical composition of plants and soil test values, (3) to evaluate the comparative response of different varieties to application of fertilizers and lime, (4) to evaluate the growth, yields, and quality of vegetable crops as influenced by amount and frequency of irrigation, and (5) to evaluate the relationship of growth and yield response to irrigation-fertilizer-stand levels.

Major emphasis in these studies will be on field trials to evaluate effects of fertilizer and lime treatments and irrigation on vegetable crops. When feasible and practical, greenhouse experiments will be conducted to supplement field data and to study the more fundamental aspects of certain problems.

SUPPORTED BY Oregon State Government

2.0896, BIONOMICS OF FISHES AND SHELLFISHES

C.E. WARREN, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

To: obtain bionomic information of important fishes and shellfish species of Oregon bays in relation to ecological factors (temperatures, salinities, currents and tidal phases, pH, dissolved oxygen, carbon dioxide, turbidity, edaphic conditions, folds, industrial and domestic sewage wastes, etc.); continue development of aqua-culture procedures for oysters, clams and other marine species of importance, particularly rearing of free-swimming larval stages of oysters and clams to seed stage; and, obtain reliable biological information as to resistance and susceptibilities of marine organisms to various pollutional conditions occurring in marine waters and provide methods and scientific data for predicting effects on marine organisms and for establishments of water quality criteria for marine areas.

Description of Work: Perform bioassays with various toxic effluents commonly discharged into marine waters using fishes and the several life stages of oysters and other marine organisms as test animals; and perfect the mussel embryo-larval bioassay techniques for quickly assessing the toxic components of effluents discharged by wood-processing industries into bays and estuaries.

Continue oyster culture studies, particularly the rearing of pelagic larvae of the Kumamoto oyster to 'seed' stage under controlled laboratory conditions; and begin preliminary studies on the damages and control of mud-shrimps to oysters.

2.0897, PERFORMANCE CHARACTERISTICS OF SOLID COVERAGE SPRINKLER IRRIGATION SYSTEM

J.W. WOLFE, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

Objectives: 1. To determine the functional relationships among uniformity coefficients, nozzle size, spacing, pressure, and

2. WATER CYCLE

wind velocity for very small sprinklers used in solid sets. 2. To determine the adaptability, limitations, and efficiency of solid coverage systems for certain specialized tasks.

Procedures: Numerous measurements of uniformity coefficient will be made from several sprinklers discharging less than two gallons per minute under varying conditions of pressure, spacing, and wind velocity. An analysis will be made on all available measurements to determine the functional relationships among the variables by multiple regression techniques. If possible, the data will be presented in such a way that it will permit designers to select the maximum possible uniformity for a given set of operating conditions.

Other performance characteristics will be investigated only as opportunities become available, especially in conjunction with other field research projects.

SUPPORTED BY Oregon State Government

2.0898, ECOLOGY AND PHYSIOLOGY OF THERMOPHILIC BLUE-GREEN ALGAE

R.W. CASTENHOLZ, Univ. of Oregon, Graduate School, Eugene, Oregon 97403

This proposal is concerned with algae that live at temperatures which would be lethal to most organisms. Ecologically, a hot spring provides a very simple system for study, because of its constancy and the paucity of species present. By a comparison of field and laboratory experiments it is possible to understand how other environmental factors operate to limit a population that is adapted to unusually high temperature. The ecological consequences of physiological processes will be revealed by this combination of field and laboratory work.

SUPPORTED BY U.S. National Science Foundation

2.0899, NUTRITIONAL AND SOIL MOISTURE REQUIREMENTS OF PEAR ORCHARDS OF SOUTHERN OREGON

P.B. LOMBARD, Oregon State University, Agricultural Experiment Sta., Medford, Oregon 97502

Objectives: Nutritional and soil moisture requirements of pear orchards of southern Oregon will be investigated so to improve the tree yields and fruit quality by the most efficient methods.

Description of work proposed: 1. Field experiments will be conducted to determine the combination of nutrient applications to give optimum levels of growth, yield, fruit quality and leaf content of pear trees. 2. Experiments to determine the most efficient use of soil moisture by pear trees will be conducted. 3. The methods of soil management which incorporate optimum levels of nutrients and soil moisture in the field will be evaluated.

2.0900, GENERALIZED SOIL - MOISTURE RUNOFF-RELATIONS

J.A. ANDERSON, U.S. Army, Corps of Engineers, Portland, Oregon 97205

It is becoming generally accepted by hydraulic engineers that the soil moisture condition of the upper soil layer is the primary factor controlling the amount of runoff from a given rainfall. The purpose of the proposed study is to develop a procedure to evaluate the soil complex of a drainage basin and arrive at the relationship that would permit computation of runoff from rainfall data.

The scope of the study would include the refinement of rainfall - runoff relationships using soil moisture as the primary parameter for typical basins throughout the United States where adequate basic data on rainfall and runoff are available. Data on soil characteristics would be obtained by field surveys and appropriate sampling procedures. Correlations of the field data and the empirically derived soil - moisture functions would then be made. Rainfall - runoff relations could then be synthesized for basins without runoff records. Such procedures could then be used to compute runoff data for river basins in similar areas of the earth where only rainfall data are available.

SUPPORTED BY U.S. Dept. of Defense - Army

2.0901, SEDIMENTATION IN SMALL FORESTED DRAINAGE BASINS

D.D. HARRIS, U.S. Dept. of Interior, Water Resources Division, Portland, Oregon 97208

Purpose is to relate changes in sedimentation patterns due to logging operations in a group of three watersheds in the Alsea River system. A comparison of similar basins which are ultimately subjected to extensive logging operations will provide the basis for correlating runoff and sediment discharge as recorded from numerous measurements made at controlled weirs and backwater pools.

Oregon State Government

2.0902, MOVEMENT OF RADIONUCLIDES IN THE LOWER COLUMBIA RIVER

W.L. HAUSHILD, U.S. Dept. of Interior, Water Resources Division, Portland, Oregon 97208

The objective of this project is to quantitatively determine the concentrations and loads of specific radionuclides that are solutes and sorbed on sediments in the Columbia River from Hanford, Washington to the estuary. The spatial and temporal variation and distribution of the radionuclide concentration and loads are to be studied, and an approximate budget of the radionuclides is to be determined.

The physical, chemical and mineral properties of the suspended and streambed sediments are being studied; and these properties, insofar as is possible, will be related to sediment transport, sorbed radionuclides, and the equilibrium balance between the solute and sorbed radionuclide phases.

The extent and characteristics of sediments deposited on the streambed and sorption of radionuclides by these sediments in the natural channel, reservoir, and tidal-affected reaches are being surveyed.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0903, THE MOVEMENT OF RADIONUCLIDES IN THE COLUMBIA RIVER ESTUARY

D.W. HUBBELL, U.S. Dept. of Interior, Water Resources Division, Portland, Oregon 97208

Certain radionuclides enter the Columbia River from the Hanford installation of the U. S. Atomic Energy Commission. Part of the radionuclides remain in solution in the water, part are sorbed on the fluvial sediment, and part are taken up by the biota. As a result, each medium, by virtue of its motion, affects the distribution of the radionuclides.

Objectives of this project are to define the disposition and movement of radionuclides in the Columbia River estuary; to study the processes that influence the movement of radionuclides, particularly the sedimentation, flow and chemical processes; and to contribute to estuarine technology.

2.0906, SCHUYLKILL RIVER SURVEY

C.H. MCCONNELL, E.H. Bourquard & Associates, Harrisburg, Pennsylvania

To conduct a general survey along the Schuylkill River to determine the extent of existing water related problems and make recommendations for a plan of development to be undertaken that would offer benefits in the form of flood control, water supply, recreational and other water related projects at critical locations.

SUPPORTED BY Pennsylvania State Government

2.0907, HYDROGEOLOGY OF PUBLIC GROUND WATER SUPPLIES IN PENNSYLVANIA

G.H. EMRICH, State Dept. of Health, Harrisburg, Pennsylvania

This study is to critically evaluate the ground water yields and chemistry of the ground water from all public ground water supplies in the Commonwealth of Pennsylvania.

The information in the file of the Pennsylvania Department of Health will be compiled and completed in a readily usable form. Work will be done cooperatively with the regional staff of the Pennsylvania Department of Health, State Geologists, Department of Forests and Waters and the U. S. Geological Survey. Initial work will be limited to public water supplies in the Susquehanna and Potomac River Basins. The data will be analyzed in order to categorize the yields and the water chemistry of ground water for each hydrostratigraphic unit. Trends in water chemistry changes will be analysed to provide information for water management programs and specific programs to abate ground water pollution.

SUPPORTED BY Pennsylvania State Government

2.0908, DELAWARE ESTUARY SEDIMENTATION STUDY

D.W. MOODY, U.S. Dept. of Interior, Water Resources Division, Harrisburg, Pennsylvania 17104

Sediment transport processes in the Delaware estuary are being studied to determine the rate of shoal development. Measured sediment loads delivered to the Delaware estuary by Coastal Plain streams are much less than the annual estimated volume of estuarine sedimentation. Therefore, other sources of sediment must be identified to balance the sediment budget.

Salinity, sediment concentration, turbulence, and many other parameters are known to affect the rate of sediment flocculation. However, little is known about the quantitative effects of the environment upon sedimentation rates. Through field and laboratory experiments the most significant parameters will be identified; these parameters will then be related to rates of sedimentation measured in the field. Results of this study will be used to estimate changes in the present shoaling pattern due to man-made modifications of water quality and the physical geometry of the estuary.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0909, REMOTE SENSING OF DELAWARE ESTUARY

R.W. PAULSON, U.S. Dept. of Interior, Water Resources Division, Harrisburg, Pennsylvania 17104

Purpose: To determine effectiveness and feasibility of remote sensing devices in estuarine hydrologic investigations.

Methods: A series of remote sensing data collection missions will be flown over the Delaware estuary by NASA and USGS aircraft. Sensitivities of sensors to water quality variations will be treated initially. Subsequent missions will be based on initial findings.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0910, COORDINATION OF ESTUARINE REMOTE SENSING IN ATLANTIC COAST REGION

R.W. PAULSON, U.S. Dept. of Interior, Water Resources Division, Harrisburg, Pennsylvania 17104

Purpose: To provide an overview of Atlantic Coast estuaries, now that it is practical to photograph or sense at frequent and regular intervals large areas of the earth's surface from space. To develop a program and mod operandi for studying estuaries and groups of estuaries from space.

Methods: Photographs, remote sensing data and other information from individual remote sensing projects will be compiled, collated, and coordinated to formulate an optimal synoptic approach to the study of the hydrology of estuaries from space.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0911, DIVERSITY AND ECOLOGICAL NICHES IN MULTI-SPECIES ASSOCIATIONS OF CHYRID CLADOCERA (CRUSTACEA)

C.E. GOULDEN, Acad. of Nat. Sci. of Phila., Philadelphia, Pennsylvania 19103

The proposed research is designed to study the structure of multi species associations of chydorid Cladocera (Crustacea) in different types of natural habitats and to relate the presence of individual species with substrates and other physical and chemical features of the environment.

Quantitative collections of chydorids will be made, using a modified Gerking Model B sampler, in a specified number of littoral habitats from April to October in 1967 and 1968 in order to study population changes of individual species of chydorids and seasonal changes in diversity related to the growth of vegetation and accumulation of organic material in each habitat. In addition, a series of different habitat types and different lakes in New England will be sampled for analysis of the diversity of chydorid associations as related to habitat and lake types. These data for each lake will be compared with data obtained from analysis of chydorid microfossils in sediments from the same lake.

Microhabitats within each habitat will be sampled to determine substrate preferences for individual species. Substrate preferences and swimming behavior of individual species will be studied in laboratory experiments. Gut analyses will be made on freshly killed specimens to identify major food items consumed by each species.

SUPPORTED BY U.S. National Science Foundation

2.0912, RESEARCH INITIATION-ADSORBED WATER AND SOIL PLASTICITY

E.J. DOHENY, Drexel Institute of Technology, School of Engineering, Philadelphia, Pennsylvania 19140

This research seeks to achieve a better understanding of the role of adsorbed and free water in generating plastic properties of soils and will attempt to provide a more quantitative basis for the Atterberg limits by relating the thickness of the adsorbed water layer at specific moisture contents. Techniques to be used in detecting and measuring the thickness of the adsorbed layer are: rates of evaporation; dielectric loss; infrared absorption spectra. Each method will be used to determine the moisture content at which all soil water is adsorbed and the thickness of the adsorbed layer will be calculated by relating total particle surface area to the volume of water in the soil sample.

2.0913, HYDROLOGIC MODELS FOR PREDICTING THE EFFECTS OF URBANIZATION

I. REMSON, Drexel Institute of Technology, School of Engineering, Philadelphia, Pennsylvania 19140

The conversion of large rural areas into urban and suburban complexes is an outstanding feature of the national development. Severe hydrologic effects will result from the ensuing conversion and development, yet the resultant effects or their remedies are neither understood or well defined. This study will include mathematical modeling to help appraise these hydrologic changes, their magnitudes, their effects and possible remedial actions.

The investigation, which will complement an initial study employing modeling for soil-moisture and ground water movement, includes as specific objectives: 1. Completion of the entire model by extending it to include overland flow, ground-water discharge to streams, stream flow and other hydrologic phenomena. 2. Testing of the validity of the model against a prototype watershed. Presently, it is planned to do this in conjunction with a study of urbanization and regional planning in the Brandywine Watershed by personnel of the Institute For Environmental Studies at the University of Pennsylvania and the Regional Science Research Institute. Use of the model to determine the hydrologic effects of different urbanization growth patterns.

SUPPORTED BY U.S. National Science Foundation

2.0914, DEVELOPMENT OF A COULOMETRIC METHOD FOR THE MEASUREMENT OF DISSOLVED OXYGEN IN SEA WATER

E.J. GREEN, Carnegie Mellon University, Graduate School, Pittsburgh, Pennsylvania 15213

This is a project for the development of a method of analysis for dissolved oxygen in aqueous solutions and particularly in sea water. The method is to be the indirect cathodic reduction of the oxygen by an electrode held at controlled potential. Upon completion of the reduction, measurement of the total charge passed through the solution gives the oxygen concentration directly without further calibration. Preliminary investigations suggest the possibility of a practical shipboard analyzer to replace the currently widely-used Winkler titration.

SUPPORTED BY U.S. National Science Foundation

2.0915, SYSTEMS APPROACH TO FLOW PREDICTION IN WATER RESOURCE PLANNING

C.L. CHIU, Univ. of Pittsburgh, School of Engineering, Pittsburgh, Pennsylvania 15213

The proposed research covers the systems analysis of hydrologic systems with a minimum of dependence on historical data, and without the unrealistic assumptions of linearity and stationarity which have rendered the application in most studies impractical.

The main approach in the investigation is:

a. To model the structural behavior of the input-output processes in the hydrologic systems. This involves the determination of the statistical characteristics of rainfall and runoff, using regression techniques, spectral and cross-spectral analysis, harmonic techniques, and Monte Carlo simulation methods.

b. To analyze 'black box' relationship between input and output processes of hydrologic systems. The mathematical technique involves the use of functional polynomials, orthogonal functions, Fourier transformations and analysis of non-stationary time series. Problems concerning the non-linearity and non-stationarity of hydrologic systems will be investigated. Emphasis will be placed on both non-linear analysis and analysis of time-varying systems.

2.0916, ANALYSIS AND SYNTHESIS OF BEDLOAD FORMULAS

R.P. APMANN, Penn. State University, U.S.D.A. Ne. Watersh. Res. Ct., University Park, Pennsylvania 16802

Object: To evaluate the usefulness, reliability, and applicability of about 17 bedload formulas; and to recommend a research program either to resolve their differences or to provide new formulas.

Plan of work: This research project on sedimentation includes the following aspects: (1) collect original publications including the basic data dealing with the different bedload formulas; (2) collect published comments on the reliability and applicability of bedload formulas; (3) critically compare formulas either graphically or in dimensionless form, or both, and limit comparisons to the ranges of the basic measured laboratory or field data; (4) synthesize the bedload formulas into one or more and develop their ranges of utility and their limitations, particularly for field use and application; and (5) recommend laboratory and field research program to (a) fill in gaps of knowledge in existing or adapted bedload formulas, (b) expand the range of the latter, and (c) provide new bedload formulas if evaluation investigation reveals (a) and (b) would not be satisfactory.

SUPPORTED BY U.S. Dept. of Agriculture

2.0917, NATURAL CONVECTION IN WATER-SATURATED POROUS MEDIA

D.A. DONOHUE, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

Using a parallelepiped model filled with a water saturated porous medium, constant temperatures will be applied to the upper and lower faces of the model. The temperature of the lower face will be greater than that of the upper. A number of temperature sensing elements will be placed at appropriate points within the rock-fluid medium and a continuous, multipoint recorder will be used to record temperatures. Fluid movement will be calculated from the temperature-time distributions at the measurement points. The effects of the geometric shape of the model, the macroscopic physical properties of the porous medium, and the viscosity of the fluid will be obtained experimentally at temperature levels of physical significance. The experimental results will be compared with proposed theoretical models and these models will be reformulated if necessary.

SUPPORTED BY U.S. National Science Foundation

2.0918, NUMERICAL SIMULATION OF GROUNDWATER FLOW SYSTEMS

D.A. DONOHUE, Penn. State University, Inst. For Res. on Land & Water, University Park, Pennsylvania 16802

The purpose of the proposed study is to apply the numerical techniques developed by the petroleum industry to the simulation of groundwater flow systems. The use of variational methods will be investigated as this approach has been shown to require considerably less computer time than the more conventional techniques. Initial studies will consist of two-phase, two-dimensional systems but the extension to three dimensions will be considered.

A generalized computer program will be written using the most efficient numerical technique. This program may then be applied to a specific groundwater system to be used as a tool in water resource management studies. Each of the various numerical techniques will be reviewed so that the efficiencies of each may be evaluated. An IBM System 360-Model 67 will be used to perform the simulations.

2.0921, SHORT-DURATION CONVECTIVE RAINFALL - DEPTH-DURATION AND INTENSITY-DURATION RELATIONSHIPS AND VARIATIONS

E.B. JONES, Penn. State University, Inst. For Res. on Land & Water, University Park, Pennsylvania 16802

Under this project, the following information will be sought: 1) The variation of rainfall depth and intensity with time, encompassing periods of rainfall of a convective nature. 2) Depth-duration and intensity-duration characteristics of the 'average thunderstorm,' and the spatial distribution of these parameters.

Two tipping-bucket rain gages with recorder-indicator units are installed at suitable locations in the general vicinity of State College, Pennsylvania. Two additional gages are located on the Mahantango watershed which is operated by the Northeast Hydrology Laboratory of the A.R.S. (U.S.D.A.).

SUPPORTED BY Pennsylvania State University

2.0922, HYDROLOGIC BEHAVIOR OF SELECTED WATERSHEDS IN THE NORTHERN APPALACHIAN REGION

E.B. JONES, Penn. State University, Inst. For Res. on Land & Water, University Park, Pennsylvania 16802

Several watersheds that as a group are generally representative of watersheds in the ridge and valley region of the northern half of the Appalachian Mountains are to be selected for this hydrologic study. Hydrologic, climatic, physiographic and other pertinent data for these watersheds will be collected.

Existing mathematical watershed models will be utilized to simulate hydrologic conditions on these watersheds, for a wide range of historic and synthesized rainfall events.

Based on results from the simulation model, estimates will be made as to what increases in runoff could be attributed to an increase in rainfall by weather modification. Objective criteria for determining opportunities for weather modification will be utilized.

2.0923, SOIL - PLANT - WATER RELATIONSHIPS

L.T. KARDOS, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

Objectives: 1. To study the energy status and dynamics of water in soils. 2. To determine the influence of plant and environmental variables upon water extraction from the soil profile.

Procedures: Using the single probe neutron attenuation method, the two probe, gamma radiation, pulse height analyzer system, and porous resistance blocks, the dynamics of water movement will be studied as it occurs in response to tension gradients induced by root systems and by evaporative removal of water in the absence of vegetation. Plastic canopies will be used in the field to assure the attainment of continuous tension gradients. Data will also be secured on temperature gradients within the soil profile in order to evaluate the contribution which thermal gradients may make to inter-horizontal movements of water.

2.0924, THE HYDROLOGIC SIGNIFICANCE OF CHEMICALLY DERIVED MEAN BASIN TEMPERATURES

R. LEE, Penn. State University, Graduate School, University Park, Pennsylvania 16802

Many aspects of the regional and local climate can be studied to best advantage if mean air, soil, and water temperatures are available for many different sites. The utility and hydrologic significance of a chemical method of measuring mean temperatures in the field (see e.g., Schmitz, W. and E. Volkert, Zeiss-Mitteilungen 1. Band, 8/9. Heft : 300-337) is to be evaluated.

The procedure will involve the instrumentation of climatological stations and two experimental watersheds at University Park with sugar-inversion sensing elements. The exponential mean temperatures obtained will be used to estimate vaporization losses based on conventional prediction models. The estimates will be compared with those obtained in the same manner using the ordinary arithmetic mean temperatures. Both series of estimates will be related to the observed difference between precipitation and stream-flow from the experimental catchment areas.

Pennsylvania State University

2.0925, AN EVALUATION OF THE SUGAR-INVERSION METHOD OF MEASURING MEAN TEMPERATURE IN A CLIMATOLOGICAL NETWORK

R. LEE, Penn. State University, Graduate School, University Park, Pennsylvania 16802

The sugar-inversion, or Pallmann-method of measuring exponential mean temperatures, and some of the difficulties involved in its use are described in WB/T-110 and WB/T-112, U. S. Department of Commerce, 1966. The Pallman-method and recent modifications of the method are to be evaluated.

The non-linearity of the reaction constant of sucrose hydrolysis as a function of temperature is a major obstacle to the use of the method since temperatures obtained in this manner do not correspond to the usual arithmetic means of a climatological network. The possibility of reducing the exponential mean temperatures to arithmetic means will be evaluated, as will the feasibility of employing the method in conjunction with regional phenological observations, or in local studies of the microclimate or topoclimate.

U.S. Dept. of Commerce - E.S.S.A.

2.0926, RAINFALL FREQUENCY RELATIONS FOR PENNSYLVANIA

C.H. MCCONNELL, Penn. State University, Graduate School, University Park, Pennsylvania 16802

To analyze the records of all recording raingages in the Commonwealth to attain improved large maps of Pennsylvania depicting the maximum rainfall expected for various durations from fifteen minutes (if it can be discerned from the data) or thirty minutes through twenty-four hours with return periods of from two years through one hundred years to return periods associated with 'probable maximum precipitation' for use in the design of dam spillways, bridge openings, culverts, and flood control works.

2. WATER CYCLE

SUPPORTED BY Pennsylvania State Government

2.0927, ANOMALOUS FLOOD RESPONSE IN REGIONS OF SIMILAR GEOMORPHIC CHARACTERISTICS

B.M. REICH, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

Statistical parameter of flood series for recorded streams in Pennsylvania draining less than 200 square miles will be analysed. Regional patterns will be sought. Particular attention will be devoted to anomalies in these extreme values. Air-photo interpretation, soils maps, and geomorphological considerations will be used to interpret the computer output.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Pennsylvania State University

2.0928, FLOOD PREDICTION METHODS FOR PENNSYLVANIA HIGHWAY CROSSINGS

B.M. REICH, Penn. State University, School of Engineering, University Park, Pennsylvania 16802

The purpose is to make maximum use of observations on floods from small-and intermediate-sized watersheds, up to 200 square miles. The end products will include maps subdividing Pennsylvania into regions of homogeneous flood response, and others delineating the values of various flood parameters from place to place. Design methods will be developed for predicting flood peaks and hydrographs.

A keypoint in the philosophy is that flood anomalies should be related to features with which field engineers are familiar. To meet this need detailed geomorphological and soils studies will be included. In the systems analysis feedback will be considered between the latter two and conventional hydrologic studies of extreme value series, synthetic hydrographs, separation of delayed flow, rise times, and triangular approximation.

SUPPORTED BY Pennsylvania State Government

2.0929, CHARACTERISTICS OF STREAM FLOW OF SMALL WATERSHEDS IN PENNSYLVANIA AND INFLUENCING FACTORS

W.E. SOPPER, Penn. State University, Inst. For Res. on Land & Water, University Park, Pennsylvania 16802

Watershed research programs are usually developed around experimental watersheds. The establishment and operation of such watersheds, however, is expensive and it is doubtful whether enough experimental watersheds will ever be established to adequately sample the watershed population. Therefore, the application and extension of research results from a limited number of experimental watersheds would be greatly facilitated if more information were available relative to regional streamflow regimens and the relation of streamflow from experimental watersheds to average regional water yield values.

Streamflow data published by the U. S. Geological Survey may be used to determine the variation in annual and seasonal streamflow, flow duration and peak flow discharge for major physiographic regions in Pennsylvania and to develop predictive equations for water yield values based on climatic, edaphic, topographic and land-use parameters.

Research data from the Leading Ridge experimental watersheds operating by the School of Forestry will be used to develop water yield models which will then be tested on other selected watersheds to devise regional coefficients and to relate coefficients to watershed physiographic features.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Pennsylvania State University

2.0930, INFLUENCE OF FOREST COVER AND TIMBER HARVESTING METHODS ON STREAMFLOW

W.E. SOPPER, Penn. State University, Agricultural Experiment Sta., University Park, Pennsylvania 16802

1. Determine the influence of forest cover on the disposition of precipitation. 2. Determine the influence of forest cover on

stream regimen 3. Determine effect of timber harvesting methods on streamflow regimen.

Six experimental watersheds ranging in size from 50 to 300 acres will be calibrated and subjected to different methods of timber harvesting.

SUPPORTED BY U.S. Dept. of Agriculture

2.0931, TRACE ELEMENTS IN RESIDUAL SOILS

A. KABATAPENDIAS, Inst. of Soil Sci. & Pl. Cult., Pulawy, Poland

Object: To formulate principles to aid in the prediction of micronutrient distribution in soils and to assess the importance of factors which affect the solubility of certain micronutrients in soils.

Plan of work: Work plan will proceed along the following lines: collection of 20 residual soils--half developed from igneous, half developed from sedimentary rocks; separation, where possible, of clay fraction from each sample; mineralogical identification and total chemical analysis of each fraction; determination of total and soluble micronutrients in each soil sample; saturation of clays with individual micronutrients with measurement of elements before and after treatment; use of different extractants with analysis of extracted solutions for major trace elements; and extension of saturation studies to whole soils and mineral samples as the need is indicated by results up to this point.

2.0932, RAINFALL CHARACTERISTICS, DROUGHT INCIDENCE AND THE DEVELOPMENT OF A RAINFALL DEFICIENCY INDEX FOR THE AGRICULTURAL REGIONS OF PUERTO RICO

M. CAPIEL, Univ. of Puerto Rico, Agricultural Experiment Sta., Gurabo, Puerto Rico

To characterize rainfall occurrence and recognize drought incidence in the agricultural regions of Puerto Rico by developing a suitable rainfall deficiency index.

DESCRIPTION OF WORK: The agricultural regions of Puerto Rico, defined on the basis of similar rainfall occurrence and temperature range, will be evaluated by their rainfall characteristics and agricultural drought incidence.

Daily precipitation from representative stations within a climatic region, comprising the largest available number of years, will constitute the main source of meteorologic information. An attempt will be made to develop from it a rainfall deficiency index, useful to evaluate priorities concerning water resources for supplemental irrigation in the so-called humid and subhumid agricultural areas of Puerto Rico.

SUPPORTED BY U.S. Dept. of Agriculture
Puerto Rico Government

2.0933, WATER REQUIREMENT BY SUGARCANE UNDER IRRIGATION

R. VAZQUEZ, Univ. of Puerto Rico, Agricultural Experiment Sta., Lajas, Puerto Rico

To determine the amount of irrigation water required for evapotranspiration and deep percolation for sugarcane. The effect of different soil moisture treatments on crop yields and sucrose content and the correlation between soil moisture and plant moisture content will be studied. The interaction between fertilizer and water application and the moisture distribution in the soil profile will also be studied.

Description of Work: Four experiments will be conducted. In one of these experiments half of the plots will be planted with sugarcane and half will be left bare covered with plastics. In another experiment the irrigation treatments will be discontinued at 6, 5, 4, 3, 2, and 1 month prior to harvest. Different levels of plant tissue moisture content will be maintained. Present installation of lysimeter tanks will be planted with sugarcane under two irrigation and nitrogen fertility levels.

2. WATER CYCLE

SUPPORTED BY Puerto Rico Government

2.0934, LOSS COEFFICIENT IN A CHANNEL BEND WITH NATURALLY DEFORMED BED

C. HADJITHEODOROU, Univ. of Puerto Rico, Water Resources Research Inst., Mayaguez, Puerto Rico

In spite of many investigations concerning the loss coefficient in a channel bend with uniform cross-section, engineers are still not able to determine accurately the loss of head across a channel bend because uniform cross-sections are rarely found in rivers or canal system.

The first part of the study will include experimental investigations and numerical solution for a laminar flow over a two-dimensional hump to understand the mechanism of energy transformation; bed-shear stresses, velocity distributions, and water-surface will be measured and computed.

A model of meandering channel will be built in accordance with the best information available. Also, bed-shear stresses, velocity distributions, and water-surface drop will be measured. The loss of head will be computed from the work-energy relationship and compared with the direct measurement of water-surface drop.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Puerto Rico

2.0935, THEORETICAL AND EXPERIMENTAL STUDY OF SUPERCRITICAL FLOW IN CIRCULAR DRAINS AND OF THE FORMATION OF HYDRAULIC JUMP IN THE SAME

L.A. NUNEZ, Univ. of Puerto Rico, Water Resources Research Inst., Mayaguez, Puerto Rico

The object of this project is to make an exhaustive study of both the theoretical and experimental aspect at the supercritical flow in circular drains. It will begin with a complete library search on existing bibliography on the subject, followed by experimental work directed towards a verification of known facts and the investigation of new ones on circular drains. The study will seek to determine:

1. If Manning's formula is applicable whenever the conduction slope is more than 0.10.
2. The variation of coefficient n with respect to depth within the drain.
3. The effect of air mixed in the flowing flow under supercritical condition.
4. The study of the hydraulic jump of easy formation in circular drain in supercritical flow.

This work intends to clear up the doubts through experimentation and particularly those related to the design of circular drains.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Puerto Rico

2.0936, DRAINAGE OF SUGARCANE LANDS IN THE HUMID SECTIONS OF PUERTO RICO

R. PEREZESCOLAR, Univ. of Puerto Rico, Agricultural Experiment Sta., Mayaguez, Puerto Rico

1. To evaluate various sugarcane planting systems adaptable to complete mechanization in relation to their drainage characteristics.
2. To determine the effect of depth to water table on the yield of sugarcane and its sucrose content.

Description of Work: This project is aimed at evaluating sugarcane planting systems in the poorly drained areas of the northern, eastern and western sections of the Island such as the local conventional system and the original Louisiana system, the turtle backing system and precision grading.

Observations and measurements will be made at each experimental site including daily rainfall, water table fluctuations, degree of ponding, uniformity of cane growth, chlorotic streak incidence, rotten cane, and cane and sugar yields.

In the water table studies several depths to the water saturated zone will be studied to determine the optimum water table for highest cane and sugar yields. The study will be conducted under controlled conditions in lysimeter tanks and under actual field conditions.

2.0937, DETERMINATION OF SAFE LEVELS OF POLLUTION IN PUERTO RICO

A.S. VAZQUEZ, Univ. of Puerto Rico, Water Resources Research Inst., Mayaguez, Puerto Rico

Some Puerto Rico Bays are receiving raw sewage and other organic pollution in high concentrations. Damage has been done to the fish population and to the recreational use of surrounding beaches, the best example being the Bay of Mayaguez just near the Campus of the College of Agriculture and Mechanic Arts where the Institute will have its headquarters.

It is proposed to investigate the degree of contamination of the bay to evaluate the proportional effect of the different factors which contribute directly to its actual and future sanitary conditions and its effects on the fish, ecology and the recreational aspect of the bay and surroundings.

This study will be carried on through the systematic measurement of parameters such as BOD, dissolved oxygen, solids, coliform group, biota, etc. Similarly, physical, chemical, and meteorological factors affecting the locality of the Mayaguez Bay will also be determined inside the bay. The goal will be to establish the relationships among the most important of the factors that enter into the problem, with the purpose of establishing criteria for prediction for similar situation in tropical bays.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Puerto Rico

2.0938, THE LOSS OF FERTILIZERS BY LEACHING FROM THE SUGARCANE SOILS OF PUERTO RICO

G. SAMUELS, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

- 1) To measure and collect leachings from various soils while used to produce sugarcane.
- 2) To determine the chemical composition of the leachings so as to measure the plant nutrients lost by leaching.
- 3) To determine how the method and time of application and form of fertilizer influences the loss of fertilizer nutrients by leaching.

DESCRIPTION OF WORK: By means of special lysimeters constructed in the field the loss of fertilizers in the soils by leaching will be studied throughout the life of the crop in order to determine how the method and time and form of fertilizer application influence these losses.

SUPPORTED BY Puerto Rico Government

2.0939, EVAPOTRANSPIRATION LOSSES AS RELATED TO SITE AND VEGETATION DIFFERENCES

J.H. BROWN, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Objectives: 1. Determine differences in evapotranspiration from several cover types occurring on similar and unlike soils and in various aspects. 2. Evaluate stand and soil properties which influence evapotranspiration including canopy interception for each cover type, and hydrologic properties of the major soil series.

Procedures: Evapotranspiration will be determined from plot studies for stand in major upland vegetation types which vary in soil type and aspect on a small forested watershed in Rhode Island. Methods based upon soil moisture changes from field capacity will be used to determine evapotranspiration employing neutron scatter methods. Where vegetation types are on poorly drained soils changes in water levels of soil wells will be used as an index of evapotranspiration. Evapotranspiration will be correlated with soil type, vegetation type and aspect taking into consideration hydrologic properties of the various soils and differences in interception by the various vegetation types.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Agriculture

2.0940, SOIL MOISTURE DISTRIBUTION PATTERNS UNDER MIXED OAK FOREST

J.H. BROWN, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

The study objective will be to relate soil moisture distribution patterns under mixed oak forests to precipitation reaching the ground by flowing down tree stems (stemflow), and precipitation falling through tree crowns (throughfall).

Studies of interception in oak forests now being conducted in Rhode Island show large differences in stemflow between white oak (*Quercus alba*) and species in the red oak group. This striking difference between species must influence considerably soil moisture distribution patterns under oak forests. Information on such patterns could have important ecological and hydrological applications.

The study will be conducted in an even-aged mixed oak stand on uniform soil. Soil moisture content will be determined using the neutron-scatter method. Access tubes will be placed at varying distances from overstory oak trees so that the influence of stemflow and throughfall can be related to soil moisture content. Patterns of soil moisture distribution will be determined and related to stemflow and throughfall and differences in species.

SUPPORTED BY University of Rhode Island

2.0941, THE WATER ECONOMY OF TURFGRASS

I.H. STUCKEY, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Objective: To evaluate the water economy of several commonly used species and varieties of turfgrasses in relation to soil type, maintenance practices and environmental conditions.

Description of Work: Measurements will be made regularly of soil moisture, soil atmosphere, soil and air temperature, and turf scores on a 1-5 basis (1 - poorest, 5 - best). The influence of fog and dew, on plant growth will be studied intensively since it is felt that these contribute materially to plant growth in areas where fog and dew are frequent but they are not reported as moisture in most weather records.

SUPPORTED BY Rhode Island State Government

2.0942, WEATHER RECORDS

R.C. WAKEFIELD, Univ. of Rhode Island, Agricultural Experiment Sta., Kingston, Rhode Island 02881

Records of air temperature, precipitation, soil temperature, wind movement, relative humidity, soil moisture and evaporation are taken to characterize the climate in the experimental plot area and aid in interpretation of data.

2.0944, A COMPARATIVE STUDY OF TRACE ELEMENT CYCLES IN SIX LAKES IN SOUTH CAROLINA

J.S. MARSHALL, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina (AT(07-2)-1)

The objective is to determine (1) the distribution and abundance of certain trace elements in lakewater solutions, seston, net plankton, and sediments and (2) the influence of key environmental factors in six dissimilar lakes in South Carolina. The most intensive work is being conducted on Par Pond, a 2700-acre reservoir on the site of the AEC Savannah River Plant. For

comparative purposes, monthly samples are being collected from five other lakes: (1) Clark Hill Reservoir, a 78,000-acre impoundment of the Savannah River above SRP; (2) Pond B, a 250-acre, abandoned SRP reactor cooling pond; (3) Big Snooks Lake, a relatively large and deep oxbow lake in the swamp bordering the Savannah River below SRP; (4) Clear Lake, a typical 'Carolina Bay,' and (5) Dicks' Pond, an abandoned farm pond on the SRP site. Iron, manganese, chromium, and zinc will be determined by atomic absorption spectroscopy. Cobalt will be determined by neutron-activation analysis. Key environmental factors will be determined by standard limnological methods.

SUPPORTED BY U.S. Atomic Energy Commission

2.0945, TRACE ELEMENT CYCLES IN A SOUTHEASTERN RESERVOIR LAKE

J.S. MARSHALL, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina (AT(07-2)-1)

The objectives are to determine (1) the seasonal and vertical distribution of the dissolved and particulate forms of certain trace elements, (2) rates of deposition of these elements, (3) distribution and abundance of these elements in sediments, benthos, and plankton, (4) seasonal variations in sorption of introduced radionuclides by the seston at different depths, and (5) the influence of key environmental factors. In order to provide a basis for predicting or explaining the fates of radionuclides in lakes, the proposed work deals with trace elements that have radioisotopes of potential ecological significance and whose lacustrine geochemistry is incompletely known. Trace elements are determined by atomic absorption spectroscopy. Radionuclides are determined by gamma ray spectrometry. Other environmental factors are determined by standard limnological methods. The study is being conducted on Par Pond, a 2700-acre reservoir on the site of the AEC Savannah River Plant.

The cycles of iron, manganese, cobalt, and zinc in Par Pond have been studied since January 1966. The concentrations of these and several other elements in lakewater solutions, seston, net plankton, sediments, and trapped deposits (formalin-preserved as well as unpreserved) at several depths have been determined monthly. In addition, the sorption (%) of ^{59}Fe , ^{54}Mn , ^{57}Co , and ^{65}Zn by seston at several depths have been determined twice monthly.

SUPPORTED BY U.S. Atomic Energy Commission

2.0946, INFLUENCE OF VEGETATION IN SOIL MOISTURE FLOW

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

The amount of rain that infiltrates a soil surface is significantly influenced by vegetation. A study is planned to measure the influence of vegetation on soil moisture flow using the deuterium oxide tracer method.

SUPPORTED BY U.S. Atomic Energy Commission

2.0947, GROUNDWATER FLOW

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

Groundwater studies are aimed at determining the flow path and velocity of groundwater in areas used to store high level waste, bury solid waste, or dispose of very low level liquid waste to the ground.

Tritium tracing has shown that groundwater flow rates vary from a few hundredths of a foot per day to about 1 foot per day and that the rates are quite variable, even within a small area, due to variable permeability of the soil.

Tritium in seepage basin water has been useful in determining the flow path of waste from such basins toward surface streams. A study is being conducted using the tritium in this waste to study the vertical component of groundwater flow and to evaluate the significance of this flow in the transport of radionuclides from storage or disposal areas.

2. WATER CYCLE

SUPPORTED BY U.S. Atomic Energy Commission

2.0948, UNDERSTANDING OF THE INFILTRATION OF RAIN INTO BURIED WASTE

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

Solid radioactive waste is buried in the zone of aeration. With a better understanding of water flow in this zone, we can better protect waste from leaching.

Since water in the zone of aeration is under a pressure less than atmospheric, it will not flow into a cavity or large pores such as in a layer of gravel unless the soil becomes saturated. Use of this phenomenon to divert soil moisture flow around buried waste is being studied. With gravel at a depth of 87 cm, sandy loam or sandy clay can temporarily store 5 to 7 cm of infiltrating rain above the gravel before leakage into the gravel occurs. A gravel barrier was found unsatisfactory for protecting burial trenches as water could not be diverted beyond 2 meters.

Determine, using tensiometers and the soil moisture neutron meter, water movement and water content in burial trench soil following controlled additions of water and following normal rainfall.

SUPPORTED BY U.S. Atomic Energy Commission

2.0949, STUDIES ON VEGETABLE CULTURE

W.C. BARNES, Clemson University, Agricultural Experiment Sta., Clemson, South Carolina 29631

Objectives: To study various phases of Vegetable Culture such as nutrition, weed control, cultural methods, drainage, plant production, etc.

SUPPORTED BY South Carolina State Government

2.0950, FEASIBILITY STUDY OF ELECTRICAL GEOPHYSICAL METHODS IN THE DETERMINATION OF SUBSURFACE HYDROGEOLOGIC ENVIRONMENTS IN SOUTH CAROLINA

T.L. DRAKE, Clemson University, School of Engineering, Clemson, South Carolina 29631

The study will determine the effectiveness of electrical resistivity and induced electrical polarization techniques as an aid in the determination of the subsurface hydrogeologic environments in the Piedmont area of South Carolina.

The research task of this proposal involves simultaneous resistivity and induced polarization soundings and traverses over the somewhat known geologic and hydrologic environments of the Fant's Grove area to determine how well this combination of methods may predict the nature of the subsurface. The Fant's Grove area is chosen because it is representative of the Piedmont area of South Carolina.

It is hoped the position of water table, thickness and type of unconsolidated material overlying the bedrock, and delineation of potential zones of high permeability in the bedrock can be identified and mapped by these methods.

2.0951, PHYSICAL, METEOROLOGICAL, AND HYDROLOGIC ASPECTS OF EVAPOTRANSPIRATION

J.R. LAMBERT, Clemson University, School of Engineering, Clemson, South Carolina 29631

The objectives of the project are: 1. To investigate the physics of water movement through plants, 2. To determine the effects of meteorological variables and soil moisture on evapotranspiration, and 3. To investigate the effect of reduced evapotranspiration rates on the water yield of watersheds.

Emphasis will be placed on the effect of evapotranspiration on the water balance of watersheds, particularly in the Piedmont regions of the Southeast. Actual evapotranspiration rates from lysimeters and watersheds will be compared with existing predic-

tion equations using meteorological data for the 600-acre watershed on which the research will be carried out. A small sub-watershed will be treated with a transpiration suppressant such as a chemical which tends to close the stomates or a coating on the leaf surfaces which increases the resistance to water vapor movement. The resulting effect in sub-surface and surface contributions to yield will be determined. The research on the physics of water flow through plants will be basic, using 1 or 2 representative plants and will be both theoretical and experimental work in controlled-humidity growth chambers.

2.0952, CRITERIA FOR FUNCTIONAL ANALYSIS OF SOIL-PLANT-WATER SYSTEMS

J.R. LAMBERT, Clemson University, Agricultural Experiment Sta., Clemson, South Carolina 29631

Objectives: 1. To determine methods of quantifying the moisture regime of plants. 2. To determine the quantitative effect of moisture regime on quality and quantity of output of one or two crops which have water management potential in South Carolina. 3. To interpret the effects of moisture regime on the selected crops in terms of production functions. 4. To determine water management needed and crop output on a frequency basis from production functions, climatological data, and soils characteristics.

Description: Plants will be grown under various moisture regimes in growth chambers and under partially controlled field conditions. Moisture regimes will be considered to be composed of soil moisture, temperature, atmospheric humidity and solar radiation, all as a function of time. Prediction equations for crop output will be developed in the growth chamber, and checked and extended in the fields. The results from both types of experiments will be analyzed in attempts to determine parameters necessary to quantify moisture regime.

2.0954, DEVELOPMENT AND EVALUATION OF HYDROLOGIC SIMULATION MODELS

J.T. LIGON, Clemson University, Water Resources Research Inst., Clemson, South Carolina 29631

The Stanford Watershed Model or a version of it will be adapted for use on computing equipment available to the researchers. The sub-procedures of this model will be checked against extensive field data available from a 561-acre experimental watershed in the Upper Piedmont region of South Carolina. Where possible improved procedures will be developed to simulate more faithfully the conditions existing in this physiographic

region. The data from this experimental watershed and other watersheds within the region will be utilized for evaluation of specific model parameters.

Simultaneously, attempts will be made to develop new models. Particular attention will be given to the simulation of soil moisture and groundwater conditions as well as streamflow. Again, available soil moisture and groundwater data from the experimental watershed will be utilized in developing procedures and checking results.

It is anticipated that the work done under this project will serve as a basis for more extensive future studies possibly involving the effects of restraints placed on the hydrologic system and economic considerations.

2.0958, HYDROLOGY OF PIEDMONT AGRICULTURAL WATERSHEDS

R.H. RAMSEY, Clemson University, Agricultural Experiment Sta., *Clemson, South Carolina 29631*

Objectives: 1. To determine water yield and peak rates of surface flow as affected by climate, vegetation, water control facilities, and management of agricultural watersheds on typical Piedmont soils and terrain. 2. To determine the influence on ground water and ground water movement by vegetation, water control facilities, and management. 3. To determine the effects of evaporation and transpiration on the total available water from an agricultural watershed.

Description of Work Proposed: The hydrology of a 600 acre Piedmont agricultural watershed will be studied. Topographic maps, a complete soils survey, and field layout maps will be made and kept up-to-date. Rainfall, evaporation, radiant energy, temperature, relative humidity, and wind speed will be measured. Gaging stations will be set up to measure runoff from the 600 acres as well as sub-watersheds with different soils-topography-vegetation complexes. On the basis of records obtained, attempts will be made to correlate watershed yield and other hydrologic characteristics with rainfall-characteristics combined with watershed characteristics. Attempts will be made to account for the disposition of all water falling on the watershed.

2.0959, INSECTICIDE LEACHING TESTS

J.K. REED, Clemson University, Agricultural Experiment Sta., *Clemson, South Carolina 29631*

Objectives: To determine the rate of release of various insecticides from granules when leached with water; to determine the physical properties of the granules that affect the rate of release of any given insecticide; and to determine the behavior of insecticides carried by water when the water passes into soil.

Description of Work Proposed: Granular formulations are widely used in the control of soil-infesting insects but little is known regarding the rate of release of the toxicant from the granule. Samples of the insecticide formulations will be placed in glass tubes and water passed over them for a period of time. Samples of the water will be collected and analyzed by bio-assay and chemical methods to determine the rate of release of the toxicant. At the end of the leaching period the residue in the glass tubes will be analyzed to determine how much of the toxicant remains. Different formulations will be tested to determine the effect of such factors as solvents, type of clays, etc. on the rate of release of the toxicant.

SUPPORTED BY South Carolina State Government

2.0960, IRRIGATION OF COTTON AND CORN.

UNKNOWN, Clemson University, Agricultural Experiment Sta., *Clemson, South Carolina 29631*

Objectives: 1. To determine the amount of fertilizer required for maximum cotton yields with and without irrigation. 2. To determine the effects of soil fumigation for nematode control on yields of irrigated and unirrigated cotton. 3. To determine the response of irrigated and unirrigated corn to rates and times of application of nitrogen.

Description of Work Proposed: Field experiments will be conducted to determine the effects on corn and cotton of different amounts of fertilizer applied to irrigated and unirrigated blocks of these crops. The effects of subsoiling and soil fumigation by the row method will be determined in conjunction with the irrigation and fertilization tests.

2. WATER CYCLE

2.0961, THE INTERFLOW PROCESS ON SLOPING WATERSHED AREAS

T.V. WILSON, Clemson University, School of Engineering, *Clemson, South Carolina 29631*

The proposed research plan involves laboratory and field studies to determine the primary factors influencing interflow on Piedmont watersheds. It is proposed to place sufficient instrumentation in lab models and in selected watershed sites to enable detection of directions of water movement during and after rainfall events. Tracers will also be employed to follow the movement of water through the soil. Physical soil parameters influencing water movement will be measured. Relationships between rates and quantities of interflow and the soil parameters will be evaluated on the basis of data obtained in the lab and field studies. The development of prediction equations, using measurable physical parameters, will be investigated.

2.0962, STREAM IMPROVEMENT STUDY

D.L. ARCHER, State Wildlife Resources Dept., *Columbia, South Carolina*

Objectives: To conduct a post-stream improvement study to further evaluate the use of stream improvement structures as a tool useful to South Carolina's trout management program.

To establish an additional 1/4-mile stream section in which to incorporate the gabion type stream improvement structure under heavily silted conditions.

Procedure: Post-stream improvement surveys will be conducted on two 1/2-mile sections of stream in which stream improvement structures have been built. This survey will consider such parameters as the fish population composition and density, abundance of aquatic food organisms, and other physical characteristics of the streams such as average depth and width, ratio of flow and pool riffle ratios.

These data will be compared with that gathered in the pre-improvement study to evaluate the success of such a stream improvement program.

An additional section of stream bed will be surveyed and gabion type structures placed so as to create pools and otherwise improve a heavily silted type stream bed. The same pre-improvement studies previously described will be initiated followed by post-improvement studies to be conducted in the future.

2.0963, EFFECT OF LAKES MARION AND MOULTRIE AS SEDIMENT TRAPS

T.R. CUNNINGGS, U.S. Dept. of Interior, Water Resources Division, *Columbia, South Carolina*

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of South Carolina.

Purpose: To determine the effectiveness of Lakes Marion and Moultrie as sediment traps.

Methods: Suspended sediment stations will be operated in the tailrace of the hydro plant, at the spillway on Lake Marion and at the railroad bridge at Rimini. The first two stations will provide a measure of the total sediment discharged from Lake Marion and Lake Moultrie. The latter station will provide a measure of the flow of sediment into the lake system.

2.0964, THERMAL GRADIENTS IN SOUTH CAROLINA

G.E. SIPLE, U.S. Dept. of Interior, Geological Survey, *Columbia, South Carolina*

This research is part of the program of water resources investigations conducted by the U.S. Geol. Survey in cooperation

with the State of South Carolina. The objective of this study is to obtain precise water temperature data in wells located in the unconsolidated Mesozoic and Cenozoic sediments of the S.C. Coastal Plain and in the Paleozoic to pre-paleozoic crystalline rocks of the Piedmont. Temperatures are measured with a single thermometer sensor enclosed in a brass sonde filled with silicon oil and connected to a rubber jacketed cable, using the technique described by Diment and Robertson (1963). These data will be used to determine changes in the earth's thermal gradient over these areas and the relation of thermal changes to structural or stratigraphic parameters.

In addition, an attempt will be made to assess these values as criteria for differentiation of hydraulic parameters (such as permeability and yield) and, where core material is available, to determine thermal conductivities to be used in the computation of heat flow. Other objectives include the correlation of temperature gradient with such factors as ground-water movement, lithology, porosity, drilling disturbance, direction of rock foliation and schistosity, and differences due to the variant instruments used.

2.0966, SCOUR AND FILL IN THE MISSOURI RIVER AS RELATED TO THE WATER RESOURCES PLANNING

F.M. CHANG, South Dakota State University, School of Engineering, *Brookings, South Dakota 57007*

For the development of the Missouri River Basin, Oahe Dam and Big Bend Dam were constructed in the Missouri River near Pierre and Fort Thompson, South Dakota. The aggradations upstream and the degradations downstream of these dams are evident due to the unbalance of the sediment discharge in this reach.

Hydraulic engineers must continuously observe the change in the river configuration and be aware of the possibility of floods and other damages from sediment deposition. And, a study of the future bed elevation is also mostly important for the planning of the irrigation systems in order to obtain the optimum functioning of the entire systems.

The specific objectives of this study are: 1. To derive an empirical relationship between sediment discharge and flow characteristics from the observed data collected by the Army Corps of Engineers in the reach between Oahe Dam and Big Bend Dam. 2. To develop, by using continuity equation, an implicit computer method to predict the change in river bed elevation at transient phases. 3. To estimate bed elevation in the future for the irrigation planning and for the prevention of the possible disasters and damages caused by floods.

2.0967, THE INVESTIGATION OF SOIL PROBLEMS IN RELATION TO IRRIGATION DEVELOPMENT IN SUBHUMID AREAS

L.O. FINE, South Dakota State University, School of Agriculture, *Brookings, South Dakota 57007*

Work in connection with this project entails field and laboratory studies of management aspects of water, soils and plants as related to the performance of crops, and behavior and properties of soils, and the use and needs of water by crops. Water management studies include frequency, timing and quantity of irrigation. Utilization of water as influenced by soil management and crop

2. WATER CYCLE

management has been investigated with several crops and variation of several soil factors affecting fertility.

Crop management variables such as plant spacing, population and sequence, and effect on performance have had major emphasis.

SUPPORTED BY South Dakota State Government

2.0968, UNDERSTANDING AND IMPROVING THE SOIL-PLANT ENVIRONMENT FOR MORE EFFICIENT UTILIZATION OF WATER

M.L. HORTON, South Dakota State University, School of Agriculture, *Brookings, South Dakota 57007*

Objectives: 1. Field measurement of soil, plant, and meteorological parameters necessary to describe the plant environment and to determine evapotranspiration rates. 2. To develop relationships for predicting irrigation water requirements. 3. To devise methods that improve the efficiency with which water and solar energy is utilized in crop production.

Description of Work: The meteorological parameters will be measured continuously, where possible, using the best available instrumentation. Soil and plant parameters will be measured frequently on a regular schedule. Evapotranspiration rates will be determined directly with weighing lysimeters and computed using energy budget methods.

Penman type equations and empirical equations for predicting irrigation water requirements will be evaluated for sub-humid Plains conditions.

Methods of application of irrigation water, modification of the microclimate, or improved management practices that show potential for more efficient utilization of water or solar energy will be studied.

2.0969, SOIL MOISTURE EVAPORATION AND ITS CONTROL

M.L. HORTON, South Dakota State University, Agricultural Experiment Sta., *Brookings, South Dakota 57007*

Investigate the basic mechanism of water evaporation from the soil surface. Develop a laboratory method of measuring the rate of evaporation from the soil surface. Determine the effectiveness of crop residues and artificial mulches on the rate of evaporation from the soil surface under field conditions.

Description of Work: Laboratory experiments will be conducted on mechanisms of reducing evaporation from the soil surface. Mechanisms that will be investigated include, liquid film forming materials, solid films, long chain alcohols, and silicone. The most promising methods will be examined under field conditions. Various tillage methods will also be investigated and compared with chemical materials under field conditions.

2.0970, SALINITY ABOVE A WATER TABLE AS AFFECTED BY RAINFALL AND IRRIGATION

W.D. LEMBKE, South Dakota State University, School of Engineering, *Brookings, South Dakota 57007*

The proposed research involves laboratory and field investigation to determine the effect of salt accumulation on water movement in a soil under irrigated conditions, as compared to conditions of natural rainfall. It also involves a study of methods of leaching accumulated salts.

Laboratory investigations will be used to measure the transmission characteristics of the soil as affected by moisture.

A field investigation with lysimeters will be employed to measure the effect of salt accumulation on water transmission and evaporation with a controlled water table.

After salt accumulation has occurred, two methods of reclaiming the soil will be compared and evaluated.

2.0971, EFFECT OF GRAZING MANAGEMENT ON RANGE LIVESTOCK NUTRITION AND ON THE RANGE RESOURCE

J.K. LEWIS, South Dakota State University, Agricultural Experiment Sta., *Brookings, South Dakota 57007*

Since 1942 replicated range pastures at the Cottonwood Range Field Station, 75 miles east of Rapid City, have been grazed heavily, moderately, or lightly from early or mid-May to early or late November by cattle and are now in high poor, high fair and high good range condition, respectively. The Agricultural Research Service under line project SWC2-d1 and SWC2-d2 have established four two-acre watersheds on relatively uniform soils in one replication of each grazing treatment.

Stocking rates will be controlled to keep the pastures as nearly as possible in the present range condition. Forage production and residue will be measured at two week intervals on permanent plots using a capacitance meter. These data will be related to precipitation, runoff, and soil moisture records taken by ARS. Livestock production from the pasture will be measured with yearling steers next year. Heifer calves will be permanently allotted to the study in the fall of 1968 and livestock diets studied in subsequent years.

South Dakota State University

2.0972, HYDROLOGY OF SMALL DRAINAGE BASINS FOR DEVELOPING HYDRAULIC DESIGN

W.F. LYTLE, South Dakota State University, Water Resources Institute, *Brookings, South Dakota 57007*

The first phase of the study consists of an investigation of existing records of rainfall and runoff through the State. A determination will be made of physical parameters above a particular gaging station with past flow records to see if they can be adequately measured. In areas of particular interest necessary instrumentation and parameter determination will be made to supplement existing records.

After determination of physical parameters at the gaging station or in the watershed above the gaging station has been made, an analysis will be made on stations with long periods of daily records to determine duration of flow curves. By comparing physical parameters of the gaging station with partial records to those with complete records, a determination can be made of which partial record stations can be used by knowing where good correlation exists. Newly instrumented stations will be used similar to partial record stations.

An analysis will be made of stations with maximum and minimum flow by extreme value probability methods and by comparison of physical parameters with stations of known extreme flow values. A process of synthesis will be used to determine duration of flow curves and extreme flow values in those ungaged watershed areas where physical parameters can be determined.

2.0973, EFFECT OF THE CLIMATE AND MICROCLIMATE ON AGRICULTURE IN SOUTH DAKOTA

W.F. LYTLE, South Dakota State University, Agricultural Experiment Sta., *Brookings, South Dakota 57007*

Objectives: To determine the benefits and effects of climate and microclimate on the agricultural production and range management in South Dakota. A. By use of weather information on punch cards and statistical methods to describe the variations and singularities in rainfall, temperature, humidity, wind, evaporation, and transpiration in South Dakota--keeping current and back-logging as fast as time will permit. B. By proper instrumentation on an agricultural weather station being established on the Agricultural Engineering Research Farm to measure gradients

2. WATER CYCLE

of temperature, humidity, wind, eddy diffusion in the micro-climatic layer between the ground and four feet above the ground. C. To develop a mobile micro-climatic laboratory that could be used anywhere in the state for securing research data.

Work planned: A. At Agricultural Engineering Research Farm: 1. Full operation of temperature, humidity, and net radiation equipment, all purchased. 2. Establishment of soil moisture, dew, evaporation measurements, recording rain gauge. B. Remote recording of temperature and humidity. C. Continuation of work on cards.

2.0974, DRAINAGE INVESTIGATIONS OF PROPOSED IRRIGATED SOILS IN

J.L. WIERMA, South Dakota State University, School of Agriculture, Brookings, South Dakota 57007

Permeability Measurements - Field and laboratory measurements will be made of the permeability of Beotia silt loam soils. The purpose of these measurements will be; (1) to evaluate the permeability of soils near the location of a proposed field drainage plot and (2) to evaluate several methods of measuring permeability.

A Field Drainage Plot - A low permeability has been observed in some Bootin silt loam soils. A field drainage plot will be established on such soil at the Redfield Farm.

The purposes of the plot will be (1) to evaluate soil permeability using actual drainage outflow that will occur in a field situation and (2) to evaluate some new methods of improving the drainability of this soil.

The plot will be designed so that water in the plot area will flow into one tile drain. The edges of the plot will consist of a plastic barrier that will extend to as deep a depth as will be practical. The plot will be surrounded by a border area which will be saturated to the same extent as the soil on the plot.

Measurements will be made of tile outflow, piezometric pressure on the plot, deep seepage, evaporation loss and flow onto the plot. An overall permeability of the plot will be obtained using theoretical equations.

The permeabilities determined by field and laboratory measurements at different depths in the plot will be analyzed and compared with the actual permeability measured by the outflow of piezometer data.

2.0975, HYDROGEOLOGY OF GLACIAL OUTWASH NEAR SIOUX FALLS, SOUTH DAKOTA

E.A. ACKROYD, U.S. Dept. of Interior, Water Resources Division, Huron, South Dakota

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in South Dakota.

Purpose: To determine the water resources available for anticipated municipal and industrial growth in the area between Sioux Falls and Dell Rapids.

Methods: The existing hydrologic data will be collected and analyzed to determine the additional data needed to construct an analog model of the area. An inventory of wells, test drilling, pump tests, and measurements of observation will be completed as required for the construction of the analog model. The analog model will be probed to determine the adequacy of available water resources for anticipated needs.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.0976, BASIC HYDROLOGIC RESEARCH IN SELECTED AREAS IN SOUTH DAKOTA

E.F. LEROUX, U.S. Dept. of Interior, Water Resources Division, Huron, South Dakota

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of South Dakota.

Purpose: To determine the contribution which a relatively small amount of physical and geophysical data for specific aquifers could make to areal reconnaissance studies of water resources in South Dakota.

Methods: Specific information for each aquifer at a site in Beadle County will be obtained by test drilling and various logging methods. Five wells will be constructed at this site. Each well will be drilled to the bottom of an aquifer, cased to the top of the aquifer and have screened or perforated casing opposite the aquifer. Water samples will be collected and aquifer tests will be made.

After these data have been evaluated, another site in South Dakota where similar data is to be collected will be selected.

2.0977, IRRIGATED GRASS INVESTIGATIONS ON THE BELLE FOURCHE PROJECT

C. ERICKSON, South Dakota State University, Agricultural Experiment Sta., Newell, South Dakota

Objectives: To evaluate production characteristics and potentials of introduced grasses. To develop an improved irrigated pasture program for western South Dakota. To investigate methods of increasing the yield from irrigated pastures.

Different species and eventually varieties of introduced grasses will be tested on the irrigated soils. Information on date of grazing readiness, proper harvest date, regrowth characteristics, response with alfalfa, response to nitrogen fertilizer and total forage yield will be taken. These factors will assist in evaluating each species for its purpose in a grazing program.

SUPPORTED BY South Dakota State Government

2.0978, STUDY OF TURBIDITY - PRODUCTION FACTORS IN LAKE KAMPESKA CODINGTON COUNTY, SOUTH DAKOTA

J.C. SCHMULBACH, State Dept. of Game Fish & Pks, Pierre, South Dakota

Objectives: To identify agent(s) causing turbidity and to determine seasonal turbidity levels of Lake Kampeska. Also, to determine the effects of turbidity upon light penetration, primary production, and plankton and benthos production.

Procedures: Horizontal and vertical sampling of the water mass to assess turbidity levels will be continued throughout the summer and fall. Special attention will be directed toward appraising the influence of the Sioux River diversion ditch upon turbidity. 1) Turbidity levels (ppm) will be determined with a colorimeter (Hach Chemical Co.) Transparency will also be evaluated with a Secchi disc. 2) Light penetrance, extinction coefficients, compensation levels will be determined with the aid of matched Weston photoelectric cells. 3) Water quality will be monitored using standard techniques and equipment. The following features will be routinely assessed: water temperature, pH, dissolved oxygen, total alkalinity and specific conductance. 4) Primary production will be estimated using the dark-light bottle technique or the carbon 14 method. 5) Net plankton samples will be collected with a Miller plankton sampler fitted with a Teske flow meter. 6) Water samples will also be assessed for their organic and inorganic fractions using a combination of techniques and equipment. The potassium dichromate method will be used to determine total organic content. Other samples will be centrifuged and ignited in a muffle furnace to determine and particulate dissolved organic matter content, and the inorganic fraction of the sample. 7) Benthic organisms will be sampled with a Petersen dredge and taken to the Laboratory for identification, counting, weighing and volumetric determinations. This part of the project will be given low priority.

Technology

2.0980, COAL STRIP MINE WATERSHED STUDY

J.C. ALLEN, U.S. Tennessee Valley Auth., Knoxville, Tennessee

A watershed project to determine how coal strip mining and subsequent reclamation affects water quality and stream ecology. The 136-acre watershed under study is in Jackson County, Alabama. Over half the watershed will be stripped for coal in 1970. Hydrologic data collection began in May 1968 upon completion of the weir and project instrumentation, and will continue for two years prior to mining, during the mining operation, and for ten years after reclamation. Biologists began sampling the stream and streamside flora and fauna in February 1968, and will continue periodic measurements through life of the study to identify ecological change.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0981, FLOOD HYDROGRAPH SYNTHESIS - UNGAGED WATERSHEDS

B.J. BUEHLER, U.S. Tennessee Valley Auth., Knoxville, Tennessee

A study to develop more adequate methods of synthesizing flood hydrographs for ungaged areas in the Tennessee Valley with particular emphasis on small watersheds. This is a continuing study which is being expanded to include in the evaluation some of the more recently developed approaches to hydrograph synthesis.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0982, FLOOD FREQUENCY STUDIES

B.J. BUEHLER, U.S. Tennessee Valley Auth., Knoxville, Tennessee

A continuing study to develop relationships and procedures for synthesizing flood frequency relationships for ungaged areas:

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0983, SIMULATED OPEN CHANNEL HYDRAULICS

B.J. BUEHLER, U.S. Tennessee Valley Auth., Knoxville, Tennessee

A mathematical model (Simulated Open Channel Hydraulics - SOCH) based upon the basic differential equations of continuity and momentum which describe unsteady, nonuniform open channel flow has been developed. Digital computer solution of the model is accomplished using the numerical methods developed by Stoker. Field measurements of stage and velocity in Wheeler Reservoir, stage in the Cumberland River below Barkley Dam, stage in Barkley Reservoir, and discharge in the canal connecting Barkley and Kentucky Reservoirs all have been successfully reproduced, thus providing verification for the basic model and computational scheme. From this base a variety of complex transient flow problems have been investigated. Research is being directed toward broadening the applicability of the model to include a broader spectrum of transient flow problems and toward other computational schemes. In these research and application efforts TVA is being assisted by MIT consultants Drs. Ronald McLaughlin and Frank Perkins.

A portion of this work is described in the publication 'Transient Flow Investigations for TVA's Browns Ferry Generat-

ing Station,' Buehler, B. J., Price, J. T., and Garrison, J. M., Proceedings, 7th Annual Sanitary and Water Resources Engineering Conference, Vanderbilt University, Nashville, Tennessee, May 1968.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0984, WATER DISPATCHING OPERATIONS BY ELECTRONIC COMPUTER

A.J. COOPER, U.S. Tennessee Valley Auth., Knoxville, Tennessee

A study to convert the daily streamflow forecasting and water control operation work of the River Control Branch to an IBM electronic computer. This work involves the continuous dispatching and control of all water which reaches the 33 hydro projects in the Tennessee River Basin presently owned or operated by TVA. Two programs are required to perform this work: (1) one program, completed in 1963 for an IBM 704 electronic computer and converted to an IBM System/360 in August 1967, will compute reservoir inflows for each of the hydro projects using rainfall-runoff relations based on antecedent precipitation index (API) and unit hydrographs; (2) work is continuing on the other program for use on the System/360 which will be used for scheduling discharges at the hydro projects mainly for power generation and flood control.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0985, COMPUTER-ORIENTED MATHEMATICAL MODEL FOR CONTINUOUS STREAMFLOW PREDICTION

A.J. COOPER, U.S. Tennessee Valley Auth., Knoxville, Tennessee

A study, currently in the analytical phase, to develop a model which should mathematically closely simulate the response of a watershed to rainfall and should be capable of predicting streamflow at a given point at any time. It is hoped that this model will yield results of the high degree of accuracy required for the optimum operation of the large TVA system of multipurpose reservoirs.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0986, FOREST INFLUENCES STUDIES

B.W. ELLERTSEN, U.S. Tennessee Valley Auth., Knoxville, Tennessee

Investigations are conducted to determine basic relationship between the effect of forest cover and forestry practices on runoff, infiltration, water quality, and other factors involved in the water cycle, and to determine hydrologic effects of reforestation, other erosion control practices, logging road construction and use, timber cutting, wildlife management, and other multiple land-use activities. This information will be used to identify practices of greatest benefit to the economy from the standpoint of optimum forest and water resource utilization. Since 1934 six watershed studies have been initiated in completely or partially forested areas. Results to date indicate that reforestation and other erosion control practices can produce pronounced changes in watershed hydrology. Twenty years after conversion to forest cover peak discharge of summer storms was reduced about 60 percent, duration of summer storm runoff was prolonged, surface runoff was retarded and sediment loss was reduced more than 95 percent on the White Hollow and Pine Tree Branch watersheds. In Parker Branch where open land predominated, farmers making optimum use of all farm resources found the objective of maximizing income was largely compatible with conservation objectives of reducing soil erosion, surface runoff, peak discharge rates, etc.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0987, UPPER BEAR CREEK EXPERIMENTAL PROJECT

P.C. SPATH, U.S. Tennessee Valley Auth., Knoxville, Tennessee

The Upper Bear Creek Experimental project established in 1962 is being carried on cooperatively by the U. S. Forest Service

2. WATER CYCLE

and TVA. The project is located in the upper reaches of Bear Creek, near Haleyville, Alabama, lying partially in the Bankhead National Forest and includes approximately 143 square miles.

Purpose: This project is designed specifically for the formulation and numeric evaluation of hydrologic methods needed for area resource development. The main objectives are: (1) The development of methods to predict streamflow information for small headwater areas from physical watershed measures and hydrologic data and project this information downstream to larger drainage areas, and then develop techniques for using these projection and predicting methods to simulate hydrologic information on other areas where data are scarce or missing. (2) To obtain basic soils-water-cover relationships in the Highland Rim area of the Tennessee River Basin. (3) To obtain data on the relationships of soils, land-use, and water quality.

Project activities have included the development of a general computer program to solve nonlinear equations, the developing of mathematical models for generating parametric measures of streamflow, the detail study of these mathematical models to assure that consistent results are obtained, a factor analysis study of the physical measures of watershed characteristics, and development of a model to relate streamflow parameters to the physical watershed measures. Papers published concerning project activities included: 1. 'Design of a Hydrologic Condition Survey Using Factor Analysis,' Hydraulic Data Branch Research Paper No. 5, November 1965. 2. 'Upper Bear Creek Experimental Watershed-Research in Hydrologic Analysis Synthesis' by Roger P. Betson, Pub. 66 I.A.S.H., Symposium of Budapest, pp 178-184, October 1965. 3. 'DIFCOR A Program to Solve Nonlinear Equations,' Hydraulic Data Branch Research Paper No. 6, June 1967. 4. 'Analytically Derived Unit Graph and Runoff' presented at the American Society of Civil Engineers national meeting, New York, on Water Resources Engineering, October 16-20, 1967.

SUPPORTED BY U.S. Tennessee Valley Auth.

2.0988, DEVELOPMENT OF HYDROLOGIC ANALYSIS TECHNIQUES

P.C. SPATH, U.S. Tennessee Valley Auth., Knoxville, Tennessee

This research, started in 1964, is for the development of new analysis techniques that are now possible with the utilization of electronic computers. Research covers the development of specific mathematical models and special studies aimed at improving hydrologic knowledge using data obtained from various TVA Watershed projects. It includes the derivation, development, and verification of equations designed to simulate various aspects of hydrology and hydrologic response as these are related to land cover, topography, and other watershed characteristics so that watershed hydrology can be incorporated in land-use improvement plans. Progress to date includes: Completion of a study of the convergence properties of a technique used to solve non-linear equations. Some of the results of this study are included in Hydraulic Data Branch Research Paper No. describes the computer program. Completion of a computer program to compute annual flow duration information from mean daily discharge data. The establishment of a series of hydrologic response index watersheds to be used in future evaluation of water resource development activities.

Research underway in 1968 includes: Development of a program package to process daily rain gage data on the computer and for the computer automatically to print daily and monthly amounts of precipitation for more than 600 stations in tables for direct use in the monthly and annual bulletins 'Precipitation in the Tennessee River Basin.'

Development of a program to reduce the U. S. Weather Bureau's graphical API-Runoff Index model for predicting surface runoff, being used in TVA river control operations, to an analytic mathematical model using only five coefficients. Predictions using both models are comparable, but the analytic model is much easier to derive and uses far less core storage.

Completion of a series of programs to be used with a chart digitizer that is used to abstract data automatically from a variety of different recorder charts.

2.0990, THE ECOLOGY OF CLOSTRIDIUM BOTULINUM IN THE TVA LAKES AREA

D.F. HOLTMAN, Univ. of Tennessee, Graduate School, Knoxville, Tennessee 37916

For the past four years we have had in progress an investigation covering the distribution of Clostridium botulinum in the TVA lakes area. Altogether, several thousand mud samples and fish have been examined. To date findings have revealed C. botulinum, types B and E. Of great interest to us is the location in the area of two sizeable canneries that discharge their wash water and other wastes into one of the lakes. These, however, do not appear to contribute to the presence of Cl. botulinum.

The study of the distribution of C. botulinum in TVA lakes has involved Cherokee, Douglas, Norris, Loudon and Watts Bar. Also, we made an intensive study of a sizeable number of spore-bearing anaerobes that elaborated in vitro a toxin capable of killing mice protected by all the available C. botulinum antitoxins. These turned out to be primarily Cl. perfringens of several different types. In view of the role of this organism in food poisoning, it seems possible that it could be regarded as a health hazard in an area where there is much commercial fishing.

2.0991, MOISTURE USE CHARACTERISTICS OF CERTAIN CROP PLANTS

W.L. PARKS, Univ. of Tennessee, Agricultural Experiment Sta., Knoxville, Tennessee 37916

Objective: To determine effect of soil moisture levels, fertility, weather, and crop variety on the moisture use characteristics and yields of certain farm crops.

Description of work proposed: Neutron moisture measurements will be used to determine the rate and extent of soil moisture depletion by crop plants. Additional moisture will be applied to some treatments to determine the influence of low soil moisture tensions on the moisture use characteristics of the crop plants. Selected varieties of a few crops will be evaluated under several moisture levels to determine how varieties differ in yield potential. Variable fertility levels will be used to determine the extent of moisture-fertility interaction. Records on moisture use during all stages of plant growth and development use rates for different periods of growth, total moisture use for the entire growing season, and moisture use efficiency. The extent that climate affects yield, growth and moisture use will be evaluated through regression techniques. Initial studies will be restricted to corn but cotton and other crops will be studied as the investigation progresses.

2.0992, TURBULENT MIXING IN SUBMERGED TWO-DIMENSIONAL WALL JETS

C.J. REMENYIK, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

2. WATER CYCLE

This project is concerned with turbulent mixing mechanisms which result as a stream of water bearing soluble or thermal pollutants is discharged into a second stream. The research objective is to provide fundamental information useful for engineering predictions of the pollutant concentration in the vicinity of the stream junction.

Applicability of the concept of eddy diffusivity (or diffusion coefficient) to mixing flows will be investigated. The experiments will involve the measurement of Reynolds stress distributions in a two-dimensional wall jet of air.

Need for such an investigation is indicated by previous research which produced evidence that the application of the concept of eddy diffusivity to mixing streams may not be valid.

The project's aims are, on one hand, to verify these findings with a higher degree of accuracy than was possible previously, and to do that by an independent method. The former aspect of this objective will be achieved with a hot wire anemometer equipped with a new linearizer circuit, the latter by a single, rotated hot wire method.

On the other hand, experimental information will be gathered to establish quantitatively details of the relationship between the turbulent shear stress and velocity distributions. The results will be used to construct a model modifying or replacing the concept of eddy diffusivity.

2.0993, EXPERIMENTAL INVESTIGATION OF HYDRAULIC TRANSIENTS IN RIVER-RESERVOIR SYSTEMS

B.A. TSCHANTZ, Univ. of Tennessee, School of Engineering, Knoxville, Tennessee 37916

The proposed research project involves a laboratory investigation to develop a qualitative and quantitative description of the hydraulic transient phenomena associated with the response of a stationary (reservoir) or moving (stream) body of water to upstream and downstream positive and negative discharge changes.

Complementary computations of water depth, discharge, and velocity will be made using an unsteady flow digital computer computational model to provide guidance and comparisons with the measured results from the physical setup.

2.0994, FLOODING OF SMALL STREAMS IN NASHVILLE-DAVIDSON CO. AREA, TENN.

L.C. CONN, U.S. Dept. of Interior, Water Resources Division, Nashville, Tennessee

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Tennessee.

Purpose: To determine the effect of urbanization on the volume, magnitude, frequency, and time of concentration of flood flows.

Methods: Hydrologic data presently available inside and outside of the county and additional data to be collected will be analyzed. Within a particular stream basin the following will be obtained:

1. Continuous streamflow and synchronized precipitation records at one site in the basin.
2. Continuous recordings of floodflow and concurrent storm precipitation at sites in selected sub-basins and at key points along the principal stream channels.
3. Supplementary surveys of high-water profiles between gaged sites following major flood events.
4. Channel cross-section and bed profile surveys necessary for flood-profile computations.
5. Compilation of necessary basin and urbanization parameters.

2.0995, HYDROGEOLOGIC MAPPING OF PALEOCENE SEDIMENTS, WESTERN TENNESSEE

W.S. PARKS, U.S. Dept. of Interior, Water Resources Division, Nashville, Tennessee

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Tennessee.

Purpose: To delineate the outcrop areas of the '1,400 foot' sand and Memphis aquifers in western Tennessee.

Methods: The outcrop area of the Paleocene sediments (a major aquiclude) must be mapped and studied first before it will be possible to interpret correctly surface observations in the unmapped aquifer outcrop areas. Hence, it is proposed to map the surficial geology of the 7.5 minute quadrangles that comprise the belt of outcrop of the Paleocene sediments. This will require field mapping of the 1,500 square miles in 28 quadrangles.

2.0996, HYDROLOGY OF UPPER BUFFALO RIVER BASIN

W.J. PERRY, U.S. Dept. of Interior, Geological Survey, Nashville, Tennessee

Purpose: To define the interrelation of ground and surface water in sufficient detail to evaluate feasibility of short cut methods for evaluating total water occurrence and availability in future river basin studies.

Methods: Complete streamflow records since 1920 are available for a gaging station on Buffalo River near Flat Woods, Tenn. Systematic measurement of ground-water levels at selected sites, and of stream and spring discharge will be made. Comprehensive coverage of surface water flows, spring flows, and ground-water levels will be made during periods of at least 2 different conditions of base flow. Streamflow, spring flow, and ground-water level patterns and geologic character of the basin will be used to define surface-ground water relations and ground-water movement in the basin.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Tennessee State Government

2.0997, LOW FLOW CHARACTERISTICS OF TENNESSEE STREAMS

W.J. PERRY, U.S. Dept. of Interior, Water Resources Division, Nashville, Tennessee

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Tennessee.

Purpose: To interpret available streamflow records and provide low-flow frequency curves for use by water-supply planners and system designers.

Method: Low-flow frequency curves and tables will be prepared for all long term gaging stations. Low-flow indices will be determined for short term gaging stations, for low-flow partial record stations and possibly for some miscellaneous sites. Duration curves will be presented for selected sites and relations between duration, low-flow frequency and mean annual flow will be investigated.

2.0998, GEOHYDROLOGY OF SHALLOW AQUIFERS IN HENRY AND WEAKLEY COUNTIES, TENNESSEE

J. WILSON, U.S. Dept. of Interior, Water Resources Division, Nashville, Tennessee

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Tennessee.

Purpose - To determine the cause or source of contamination of ground water and to appraise the shallow water-bearing formations.

2. WATER CYCLE

Methods - An inventory of representative wells will be made. Water from wells will be sampled and analyzed to determine the bacteriological and chemical quality of ground waters. Test holes will be augered, observation wells will be constructed and pumping tests will be performed to define the areal extent and water bearing characteristics of shallow aquifers.

2.0999, GEOCHEMISTRY AND HYDROLOGY OF A SMALL BASIN IN THE UPPER BUFFALO RIVER WATERSHED, TENNESSEE

R.G. STEARNS, Vanderbilt University, Graduate School, Nashville, Tennessee 37203

The purpose is to gain more knowledge and understanding of the manner and rate of chemical weathering on the Western Highland Rim, Tennessee. The study plan is to determine the properties of water in various portions of the basin system to be able to interpret the changes in water through the hydrologic cycle in this small basin. The basin was chosen because of its topographic form, characteristic bedrock and residuum, numerous wells, and easy accessibility. These factors make frequent chemical and piezometric monitoring feasible.

2.1000, RADIONUCLIDE CYCLING IN AQUATIC ECOSYSTEMS AND THE USE OF ISOTOPES TO DELINEATE AND QUANTIFY BASIC ECOLOGICAL PROCESSES

D.J. NELSON, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee (W-7405-ENG-26)

Biogeochemical studies--Previous studies employing whole-body counting techniques showed the rapid uptake of radiostrontium from water by white crappies (*Pomoxis annularis*). Current experiments using serial sacrifices were conducted with blue-gills (*Lepomis macrochirus*) to determine the relative importance of flesh and blood in the uptake of radiostrontium. The greatest rate of uptake occurred within 48 hours in both components. These studies showed that the blood accounted for a significant proportion of radiostrontium activity in the soft tissues of bluegills during the period of initial Sr uptake. Parallel research on the effect of different environmental Sr concentrations on Sr uptake in flesh showed the concentrations in the tissue were directly proportional to those in the water within the range of 0.003 to 30 ppm. This research shows that isotopic dilution would not be an effective means of reducing radiostrontium uptake.

Research with Cs 137 in white crappies continued with determination of biological half-lives. After the passage of a contaminated bolus through the gut a half-life for Cs 137 of approximately 170 days (at 120 degrees C) is indicated. These results show that crappies are long-term integrators of Cs 137 in the aquatic environment. The passage of the contaminated bolus may have interfered with detection of shorter components in the excretory curve. With snails (*Goniobasis*, *Physa*, *Lymnea*) a short component of about 4 days and a longer component of 12-16 days was observed for radiocesium excretion. Data on the biological half-life of Cs in snails will be used in connection with studies of their feeding rates in White Oak Lake.

Aquatic food chain studies--The transfer of Ru 106, Cs 137, and Co 60 from detritus and algae collected in White Oak Lake to snails (*Physa*), worms (*Limnodrilus*), and midges (*Stictochironomus*, *Procladius*) larvae was studied in laboratory microcosms.

Peak concentrations of all radionuclides occurred in the detritus feeders by day 3 while peak activity appeared in *Procladius* on day 14. The study also showed that food particle size affected levels of activity in the detritus feeders. With whole detritus the worms accumulated the most radioactivity while with pulverized detritus *Stictochironomus* was higher. Thus, physical size of contaminated food particles affects environmental pathways of radionuclides.

2.1001, PRIMARY PRODUCTION

B.C. PATTEN, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee (W-7405-ENG-26)

Strontium-85 assimilation by plankton communities of Melton Hill Lake (Clinch River embayment) is greater in light than in dark. Dark uptake can be correlated with respiration as measured by changes in dissolved oxygen. Light assimilation is quantitatively related to photosynthetic activity, except at high light intensities where the oxygen method indicates inhibition of photosynthesis while 85 Sr continues to accumulate in cells in proportion to illumination. These results suggest that 85Sr may be useful in the estimation of aquatic production, with possibilities of being superior to the oxygen method at high light intensities, and to the 14C method due to ease of counting.

SUPPORTED BY U.S. Atomic Energy Commission

2.1002, MICROCLIMATE ANALYSIS

J.T. CARR, State Water Development Board, Austin, Texas 78711

Objective: To study the effect of the microclimate on evaporation, transpiration, the use of electricity to operate irrigation pumps, and the use of water to protect irrigated orchards and row crops from frost damage, as well as to investigate the turbulent exchanges of heat, moisture, and momentum in the planetary boundary layer.

Approach: An analysis of detailed records of temperature, humidity and wind observations taken at several levels on a 50 foot tower located on the grounds of the Medina Electric Cooperative's generator station near Pearsall, Texas, and comparison of these records with electric power consumption rates.

SUPPORTED BY Texas State Government
Medina Electric Cooperative, Inc.

2.1003, QUALITY OF WATER OF THE TEXAS BAYS AND ESTUARIES

D.C. HAHL, U.S. Dept. of Interior, Water Resources Division, Austin, Texas

Purpose: To define 1) the occurrence, source, and distribution of nutrients; 2) current patterns, directions, and rates of movement; 3) the physical, organic, and inorganic water quality and its areal distribution and time variation; and 4) the occurrence, quantity, and dispersion of fresh water, and return flows through the estuaries.

Methods: Reconnaissance quality-of-water surveys will be used to select ranges for repeat surveys to define the quality of water, areal and vertical distribution of organic and inorganic constituents, and patterns of movement. Each survey along a range will be made over a time span long enough to define changes during a tidal cycle. Also, repeat surveys will be made to define the quality changes over different seasons and under different hydrologic conditions. The surveys will be made using a boat equipped with a sampling system, and with instrumentation so that specific conductance, temperature, pH, and dissolved oxygen content can be determined in the field at different points in the vertical at each sampling site.

2.1004, PERMIAN BASIN - ORIGIN OF SALINE WATER DISCHARGE

P.R. STEVENS, U.S. Dept. of Interior, Water Resources Division, Austin, Texas

Natural brine discharging through seeps, springs and salt flats contaminates the water in many streams in the Permian Basin. Previous investigations have ascribed this salt condition to the circulation of ground-waters through salt-bearing rocks and ultimately the discharging of the salt water in topographic low areas. Another hypothesis postulates that brine underlies the entire Permian Basin at a relatively shallow depth; the brine is overlain by

2. WATER CYCLE

relatively fresh water; the interface describes a surface of hydrodynamic equilibrium which also functions as a impermeable boundary separating the brine and fresh water into essentially discrete hydraulic units. The objective is to study all aspects of the occurrence of brine in this area and suggest measures that might alleviate the condition.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1005, HYDROLOGIC STUDIES OF SMALL RURAL TEXAS WATERSHEDS

T. TWICHELL, U.S. Dept. of Interior, Water Resources Division, Austin, Texas

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Texas and the Soil Conservation Service.

Purpose: To determine the effects of temporary storage in small flood-detention structures and of land-treatment measures on the water yield to major water-conservation reservoirs and to provide data which can be utilized in the design of future structures and in checking the performance of existing structures.

Methods: Rainfall and runoff records are being collected and computed on a continuing basis in eleven watersheds. Rainfall-runoff analyses are being made for outstanding storms each year in every watershed, and these data will be used to study possible changes in rainfall-runoff relations between watersheds and the effects of flood-detention structures within each basin. Runoff records collected at points in some adjacent basins will be used as currently being collected in the small watersheds. In basins where no flood-detention structures have been built, detailed hydrologic data are available for several years, and by continuing the data-collection program, the analysis before and after conditions of development will be facilitated.

2.1006, EXTERNAL GEOMETRY OF SUPERPOSED ELONGATE SANDSTONES, NORTH-CENTRAL TEXAS

L.F. BROWN, Univ. of Texas, Bureau of Economic Geology, Austin, Texas 78712

The project is a study of surface and shallow subsurface Upper Pennsylvanian and Lower Permian channel-fill sandstones of fluvial and deltaic origin within 2,000 square miles of North-central Texas (Stephens, Eastland, Callahan and Shackelford counties). Areal distribution, stratigraphic position, and primary control of multistory and multilateral sandstone patterns are of primary interest. Approximately 350 measured sections and 250 wells were used to delineate these linear sandstone bodies at the outcrop and to project them into the West Texas Basin. Channel-fill sandstones are primary aquifers (excepting Quaternary deposits) although exploration for them is complicated by narrow, meandering patterns. Sandstones occur at thirty stratigraphic positions; ten major systems were studied in detail. Second-derivative structural and isopach mapping provides an approach for predicting sandstone distribution.

2.1009, SELECTIVE WITHDRAWAL AT LAKE LIVINGSTON

E.G. FRUH, Univ. of Texas, School of Engineering, Austin, Texas 78712

The overall goal of this project is to evaluate the significance of selective withdrawal as a tool in the water quality management program for impoundments.

Impoundments at Livingston of the relatively rich organic and inorganic nutrient laden Trinity River will bring about a marked variation in water quality with depth. Lake Livingston fortunately is one of the few impoundments in Texas having an outlet works that provides a means for selecting release water from various depths. By releasing different strata of water through the dam's variable depth outlets, the quality of water desired both for Houston's supply and for the freshwater input to Galveston Bay can perhaps be met.

To fulfill this goal, field and office investigations will determine the limnologically significant water quality parameters of the Trinity River at and above Livingston before and while the impoundment fills. At the same time, laboratory investigations on two types of 'pilot impoundment units' will be conducted to predict water quality changes for simulated reservoir conditions. Following impoundment filling, field studies will determine the water quality of the impoundment and its releases. These data will be useful in evaluating the water quality changes predicted through use of the 'pilot impoundment units.' Furthermore, from such field data an experimental operating program can be organized for the following year to evaluate this use of selective withdrawal as a water quality management tool.

2.1010, MODEL RIVER SYSTEM STUDIES

E.F. GLOYNA, Univ. of Texas, School of Engineering, Austin, Texas 78712

A 200 ft. long flume-pond ecosystem is being used to simulate a stream receiving radioactive wastes. The variables in the system are modified to stimulate ranges of stream flow regimes, and the partitioning of fate, of the radioactive species is recorded. The ultimate goal of this project is the development of a mathematical model, which when given several parameters easily measured in the stream system in question will enable a prediction of the behavior of the radionuclides released and an evaluation of the safeness of the operation.

The flume system enables many of the variables to be kept constant or, at least, to be controlled so that the effect of others can be determined, thereby making it practical to develop such a math model.

A mathematical model simulating the transport of cesium, strontium, ruthenium, zinc, cobalt and chromium in a dynamic stream system has been initiated. The effect of suspended material and changing chemical nature of the ecosystem on the uptake and release of the various radionuclides will be determined.

2.1011, GEOLOGY AND HYDROLOGY OF THE PRESIDIO BOLSON, TEXAS AND ADJACENT MEXICO *C.G. GROAT, Univ. of Texas, Bureau of Economic Geology, Austin, Texas 78712*

This project involves a detailed stratigraphic study of bolson deposits and the geohydrology of the basin. Bolsons are common throughout the southwestern United States, but only in a few localities, such as the Presidio Bolson, have bolson deposits been dissected by streams to the degree that affords extensive exposures. Utilizing these exposures, the distribution of sediment types has been mapped and the sediments described in detail. This information has been used to interpret the geological history of the basin and to obtain a better understanding of the relationships between bolson stratigraphy and the quantity and quality of ground water present.

Because bolson deposits are important sources of ground water, it is important to have an understanding of the relation of stratigraphy to ground-water yield and quality in order to attain the most beneficial use of bolson ground water. It is hoped that the relationships exhibited in the Presidio Bolson, when combined with other data, can be applied to the construction of a model to aid in ground-water development in other bolsons.

SUPPORTED BY University of Texas

2.1012, RELATION OF PASS OPENINGS ON PHYSICAL EXCHANGE AND SALINITY IN ESTUARIES *F.D. MASCH, Univ. of Texas, School of Engineering, Austin, Texas 78712*

It is generally accepted that there is not enough fresh water to meet the State of Texas' inland water requirements, and at the same time provide the fresh water necessary to maintain fisheries, pollution control, and recreation in the coastal bays and estuaries. Consequently, alternatives for meeting the desired salinity distribution and pollution control requirements in estuarine waters must be considered.

Most of the estuaries along the Texas Gulf Coast are separated from the Gulf of Mexico by a long thin chain of offshore or barrier islands. The exchange between gulf and bay waters takes place through a few natural and artificial passes through the barrier islands. It is the principle objective of this proposed project to determine whether the physical exchange of waters between the bays and gulf can be increased by either dredging new passes, or by enlarging existing passes through the barrier islands. In particular, the effects of modifications or additions of passes on the volume of physical exchange, the degree of mixing, and on salinity gradients is to be determined.

2.1014, GEOLOGY OF THE LAJITAS AND REDFORD QUADRANGLES, BREWSTER AND PRESIDIO COUNTIES, TEXAS

J.F. MCKNIGHT, Univ. of Texas, Bureau of Economic Geology, Austin, Texas 78712

This project, the geologic field mapping of an area in western Texas, is the latest in a continuing series of geologic quadrangle maps prepared by various geologists and issued with an accompanying text. The maps of this series are published at scales of 1:63,360; 1:48,000; 1:31,680; and 1:24,000. They provide geological information that is fundamental to ground-water studies. Field work has been terminated and the manuscript is in preparation.

SUPPORTED BY University of Texas

2.1015, MATHEMATICAL SIMULATION OF RAINFALL RUNOFF PROCESSES

W.L. MOORE, Univ. of Texas, School of Engineering, Austin, Texas 78712

Methods of relating runoff and rainfall will be developed whereby electronic computers, together with a fairly short period of records, will be used to develop parameters that represent the runoff characteristic of the watershed. The methods will utilize the available information on spatial and temporal variations in the rainfall.

The study will be concerned with two types of problems; the first dealing primarily with the amount of runoff and the second with the time distribution of the runoff at the outlet of the watershed. In both cases, the runoff will be treated on a storm by storm basis. For studies of water yield, the solution to the first type of problem will be sufficient, but for studies of flood discharge it will be necessary to have solutions for the second type of problem also.

The determination of the amount of runoff will be based on correlating runoff to rainfall using a computer and selected storms to determine a group of parameters which will be chosen to best represent the watershed conditions by use of an optimization process. The runoff sequence at the watershed outlet will be determined using a modified unit hydrograph concept which will be determined using a modified unit hydrograph concept which will lead to another group of parameters, describing the temporal characteristics of runoff from the watershed. The values of these parameters will again be determined by an optimization process using electronic computers.

2.1016, DETERMINATION OF FACTORS AFFECTING THE COMPETITIVE ABILITY OF WEEDS IN SEMI-ARID AREAS

A.F. WIESE, Texas A & M University System, Agricultural Experiment Sta., Bushland, Texas

OBJECTIVE: To determine the role of root growth pattern, root and top growth rate, moisture extraction patterns and other factors on the competitive ability of various weeds under semi-arid conditions.

WORK PROPOSED: Studies will be conducted in the greenhouse, growth chamber and field to determine what characteristics (rate of top growth, rate of root growth, moisture extraction pattern, development of assimilation surface, water requirement and nutrient uptake) make weeds good competitors under semi-arid conditions. The greenhouse will be used to determine root growth characteristics, water requirement and nutrient uptake. The growth chamber will be used to study the effect of light, humidity, temperature and soil moisture on seed germination, vegetative growth and floral initiation. Field studies will be used to determine moisture extraction patterns.

2.1018, SEDIMENT PRODUCTION YIELD AND DELIVERY RATE IN RELATIONS TO CLIMATIC AND WATERSHED CHARACTERISTICS

R.W. BAIRD, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Small watershed areas have contributed large amounts of sediment to streams and reservoirs in the Blacklands. Measuring the effectiveness of improved land use practices on the amount of sediment and its movement downstream is the objective of this study.

Sediment yields are measured from 5 watersheds. One is a check area of 176 acres with no special improved practices. The second, an area of 132 acres with improved land uses including grasses on selected areas and terraces as recommended on cultivated land. The third, an area of 16 acres of small grain crop. And the other two watersheds of 1,110 acres and 4,400 acres with the practices common in the Blacklands.

Data now available indicate that the improved land uses, including grasslands, reduce the sediment yield about 80 percent as compared to the check areas, and cropland with terraces and a small grain crop reduces sediment yield 50 percent or more. Apparently there is enough sediment deposited in the lower parts of the small watersheds so that sediment yields, in tons of soil per acre, decrease with size of area.

For the watersheds of 1,100 to 4,400 acres, there is less decrease in sediment yield. The fine clay particles in suspension apparently will move downstream without a large amount of deposition in the stream channels.

SUPPORTED BY Texas State Government

2.1019, MEASUREMENT OF RUNOFF AND SOIL LOSS DIFFERENCES BETWEEN ESTABLISHED PLOTS

R.W. BAIRD, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

A group of 12 plots each 1 and 1/2 acres in size had been in operation several years with measurements of runoff and soil loss. Variations with treatments were greater than anticipated and a uniform treatment has been established to determine the variability when treatments are alike.

In addition to the rainfall, runoff, and soil loss information, fifteen shallow (18 to 20 feet) ground water wells have been established and instrumented in the area adjacent to the plot areas. During drilling operations some of the borings penetrated permeable strata with water under artesian pressure, causing a rise in water level to within 2 feet of the ground surface. The effect of this variable ground water on surface runoff has not yet been evaluated.

Several years of record will be required before the differences other than the differences due to treatment can be evaluated.

SUPPORTED BY Texas State Government

2.1020, SEDIMENT YIELD IN RELATION TO CLIMATIC AND WATERSHED CHARACTERISTICS IN THE EDWARDS PLATEAU

R.W. BAIRD, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Measurement of sediment deposition in flood water detention reservoirs has been possible in connection with runoff studies at five flood detention reservoirs in Lowrey Draw. These range lands in the Edwards Plateau are not considered areas with large sediment yields even though much of the area is seriously overgrazed.

Detail topographic maps of the five reservoir pool areas have been made, and range lines established in two. As these flood detention reservoirs are frequently dry, resurveys will be made and the range lines rerun when sufficient sediment has been deposited to be determined by such surveys.

Deposition from runoff during a heavy storm period September 19-24, 1964 was not sufficient to justify resurveys.

SUPPORTED BY Texas State Government

2.1021, RUNOFF AND WATER YIELD AS AFFECTED BY CLIMATIC AND WATERSHED CONDITIONS IN THE BLACKLANDS OF TEXAS

R.W. BAIRD, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

The objectives are (1) to determine from records of runoff from agricultural watersheds the effects of watershed characteristics, treatment, and climatic factors on rates and amounts of storm runoff and water yield- and (2) to develop methods to predict from available data the effects of probable land uses and treatments on the magnitude and frequency of flood flows, the amount of storm runoff and water yield. Rainfall and runoff data have been collected from 16 watersheds over a period of years. One watershed has been continued in the same use throughout the entire period of record, but changes have occurred on all others since the original five-year period, when all had nearly the same treatment.

Several reports on rates and volumes of runoff, and effects of treatments have been published. Additional studies now in progress include the effects of different land uses as affected by stage of growth.

The effects as measured on watersheds with maximum size of about 300 acres will be projected to areas of as much as 4,400 acres where runoff and rainfall records are also available.

2.1022, VARIATION OF SATURATED HYDRAULIC CONDUCTIVITY OF HOUSTON BLACK CLAY WITH SOIL DEPTH AND WITH DIAMETER OF SOIL CORES

E. BURNETT, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

The objective of this study was to determine the saturated flow-rate of water through undisturbed cores of Houston black clay and to develop procedures for utilizing large diameter soil cores for measuring hydraulic conductivity. Large diameter (16 and 30 inches) columns of undisturbed Houston black clay were obtained by a new procedure developed at this location. Small diameter (3 to 4 inches) soil cores were obtained by standard methods. Saturated hydraulic conductivity was determined on both the large soil columns and small cores under carefully controlled environmental conditions. In addition, bulk density at field moisture content and at saturation were made on the small cores.

In general, bulk density showed a linear increase with an increase in soil depth. There was a general linear decrease in permeability with increases in soil and was associated with the increasing density, especially in the higher density ranges from 1.25 to 1.45 g/cc. Below 1.25 g/cc, permeability was not related to bulk density and apparently depended upon other factors.

Permeability values from the large diameter soil cores were generally higher than corresponding values from the small cores.

2. WATER CYCLE

Over prolonged periods, permeability of the large cores declined with time probably due to clogging of soil pores by some mechanism not evaluated.

The study has been completed, and the results are being interpreted and analyzed prior to manuscript development.

2.1023, RESEARCH ON CHARACTERISTICS OF CONVECTIVE CLOUDS IN TEXAS

H.R. BYERS, Texas A & M University System, Graduate School, College Station, Texas 77843

The purpose of this project is to analyze data collected during June 1967 by a specially equipped, cloudphysics, research aircraft on 20 sorties into cloud-free as well as cloudy air in Southeast Texas. The aircraft was provided without charge by the National Center for Atmospheric Research, Boulder, Colorado, and the data represent the print-out from NCAR's CDC 6600 Computer--also provided without charge. The goal of the research is to determine the appropriate models of fair-weather cumulus, swelling cumulus humilis, and cumulus congestus clouds that occurred during the period of observation.

2.1024, A HYDROMETEOROLOGICAL STUDY RELATED TO THE DISTRIBUTION OF PRECIPITATION AND RUNOFF OVER SMALL DRAINAGE BASINS - URBAN VERSUS RURAL AREAS

R.A. CLARK, Texas A & M University System, Graduate School, College Station, Texas 77843

This study will utilize rainfall and runoff data from several rural and urban basins in Texas to determine variability in runoff due to: 1. Type of urbanization (including stage of development). 2. Changes in vegetation and vegetative cover. 3. Possible effects on the rainfall regime due to urbanization.

The ultimate goal of such studies is to develop objective techniques for determination of values to be used in hydraulic design based on easily obtained parameters. Such techniques would incorporate parameters which reflect changes caused by urbanization.

2.1025, THE EFFECTS OF SWEETCLOVER, NITROGEN, SUPPLEMENTAL IRRIGATION, AND PLANT POPULATION ON GRAIN SORGHUM YIELDS OF BLACKLAND SOILS

J.W. COLLIER, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Data will be obtained on water stable aggregates, organic matter, bulk density, water intake, runoff, and soil loss in order to determine the effects of previous cropping systems on soil physical properties. These data will also be examined for use in evaluating the duration of improved soil physical conditions caused by previous cropping systems.

SUPPORTED BY Texas State Government

2.1026, GROWTH AND YIELD OF COTTON AND TOMATOES UNDER DIFFERENT MOISTURE LEVELS AND PLANT SPACING IN THE LOWER RIO GRANDE VALLEY

C.J. GERARD, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

1. To evaluate the influence of moisture levels and plant spacings on yield and quality of cotton and tomatoes. 2. To determine the water requirement for optimum production of cotton and tomatoes in the Lower Rio Grande Valley of Texas. 3. To determine the influence of moisture levels and plant spacing treatment and their interaction on plant growth characteristics.

The influence of moisture level and spacing treatments on the growth, yield and quality of cotton and tomatoes will be evaluated in the field. The influence of moisture level treatments on water requirement of cotton and tomatoes will be determined in the field with a neutron probe.

2.1027, STATISTICAL ANALYSES OF THE VARIATIONS OF PRECIPITATION-TEMPERATURE AND EVAPORATION IN TEXAS

J.F. GRIFFITHS, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives--(1) To analyse statistically those aspects of the three climatic parameters (rainfall, temperature and evaporation) considered to be of prime importance by agricultural and meteorological specialists. (2) To present the results of these analyses in a simple manner, generally graphically or in map form, so that users may extract rapidly the pertinent details.

Description--(1) A collection of the pertinent available data will be made and stored on the A&M campus. (2) After discussions with personnel of Texas Agricultural Experiment Station concerning priorities various aspects of the parameters will be tackled in order. (3) For each chosen aspect statistical analysis will follow, roughly, the pattern; Rainfall (1) annual and monthly totals, (2) monthly persistence (auto-correlation) and dependence (serial correlation), (3) wet and dry spells, (4) trends and cycles, Temperature (1) monthly auto- and serial correlation, (2) daily variations, (3) degree days spectra analysis; Evaporation--empirical relationship with other climatic parameters.

2.1028, RUNOFF PRODUCTION FROM UNIT SOURCE WATERSHEDS IN THE EDWARDS PLATEAU

W.G. KNISEL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Seven small watersheds ranging in size from 4.5 to 12.2 acres have been established in the Edwards Plateau near Sonora to determine the effects of soils and geology, and cover condition on runoff rates and amounts. Six of the watersheds are located on the Texas Agricultural Experiment Station Substation No. 14 where different levels of grazing are maintained for range management experiments. The seventh watershed is on privately owned land. A recording rain gage is located near each watershed. Data from these watersheds will be used to develop rainfall runoff relationships for Edwards Plateau rangelands.

Although little data are available at the present time, some preliminary analyses indicate that 7-day antecedent precipitation, 15-minute rainfall intensity, and total storm rainfall are dominant factors in runoff volume prediction within soil and geology groups. Cover conditions which are important factors, will be evaluated when sufficient data are available.

Currently available runoff prediction techniques tend to overestimate runoff compared with measured volumes. The overestimate is apparently partially due to geologic mantle underlying the watersheds.

The watersheds have been in operation for too short a period to arrive at any conclusions. Measurements and observations are being continued.

SUPPORTED BY Texas State Government

2.1029, RUNOFF PRODUCTION BY UNIT SOURCE AREA

W.G. KNISEL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

The major objectives are (1) to determine rates and amounts of runoff as affected by land use and treatment, and changes in soil moisture, (2) to determine rainfall-runoff relationships, and (3) to develop techniques to predict runoff on ungaged, mixed land use watersheds from readily available data.

Rainfall-runoff relationships with antecedent soil moisture as a parameter have been developed for the major crops in the blacklands. Soil moisture accretion-depletion techniques have been developed with pan evaporation and mean daily temperature as indicators, by crop and season. The runoff prediction technique has been tested on gaged watershed where rainfall, evaporation, temperature, and land use data are available. The

2. WATER CYCLE

results are encouraging in that measured and computed runoff volumes from the mixed land use watershed agreed within 15 percent. Refinements of the procedure are in progress but are not complete for all land uses. Storms occurring when antecedent moisture is low are causing the largest error rather than the flood producing storms with high soil moisture.

SUPPORTED BY Texas State Government

2.1030, RELATION OF CLIMATIC AND WATERSHED CHARACTERISTICS TO STORM RUNOFF IN THE EDWARDS PLATEAU

W.G. KNISEL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Very little information has been obtained on rates and volumes of storm runoff from small range watersheds in the Edwards Plateau. The objectives of this work are primarily to determine the rates and volumes of storm runoff as affected by size of area, soils and geology.

Five soil conservation service flood detection reservoirs have been instrumented to measure inflow and outflow. The drainage areas range from 686 acres to 10,787 acres. Runoff is measured at a mainstream station with a drainage area of 48 square miles of which approximately 70 percent is controlled by the five reservoirs.

Precipitation records are obtained from a network of 14 rain gauges for the 48-square mile area and the five subwatersheds.

During a 7-day storm period, rainfall ranged from 7 to 19 inches, but runoff was less than expected from the hydrologic group D soils. The fractured limestone underlying the soil was an important factor in maintaining high percolation rates throughout the storm period.

Isolated convective type thunderstorms typify the summer climate. Considerable volumes of runoff have been measured from this type storm, but due to the relatively small area of coverage, mainstream flow is small, and widespread flooding is rare during the summer months of June, July, and August.

SUPPORTED BY Texas State Government

2.1031, WATER YIELD AND GROUNDWATER MOVEMENT IN THE EDWARDS PLATEAU AS AFFECTED BY GEOLOGY, CHANNEL AND VALLEY MATERIALS, AND FLOOD STRUCTURES

W.G. KNISEL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Rainfall, runoff and groundwater data are obtained in the 48 square mile Lowrey Draw watershed and subwatersheds to evaluate water yield and groundwater movement in this karst area. Three groundwater observation wells near a floodwater retarding structure have been instrumented for continuous water level records. Manual measurements are made at six other wells in the Lowrey Draw area. Changes in water level as affected by natural recharge from rainfall, and by flood detention reservoirs can be evaluated.

Losses from floodwater detention reservoirs during storm periods indicate that large volumes of water are transmitted through the limestone solution channels in the reservoir floors. Groundwater levels have been observed to rise as much as 85 feet in wells near a reservoir during a major storm period. A rise of 60 feet was observed during the storm period at a well approximately 3/4 mile from the reservoir. Other wells outside the direct influence of the reservoirs indicated a maximum of 3-foot rise which has primarily natural recharge from rainfall. Water level fluctuations indicated a relatively high transmission rate throughout the storm.

Abstractions from mainstream flow appear to be large during storms of partial area contribution to surface runoff. Abstractions during storms of large areal coverage are more difficult to evaluate, but the percent of abstraction is less.

Two papers have been published in the ARS 41-series on geology and groundwater studies.

SUPPORTED BY Texas State Government

2.1032, PRECIPITATION CHARACTERISTICS INFLUENCING RUNOFF FROM AGRICULTURAL WATERSHEDS IN THE BLACKLANDS AND EDWARDS PLATEAU OF TEXAS

W.G. KNISEL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

The primary objective is to furnish basic precipitation data for experimental watersheds in the development of rainfall-runoff relationships. In addition to the supporting role, regional characteristics of precipitation are evaluated.

Rain gage networks of varying density have been maintained for 30 years in the Blacklands at Riesel and 6 years in the Edwards Plateau at Sonora. Daily rainfall is measured and rainfall intensity and kinetic energy are computed. Antecedent moisture and rainfall amount is the major factor in the rainfall-runoff relationship for the Blacklands. Preliminary analyses indicate that 15-minute intensity may be important for small areas in the Edwards Plateau. Seven-day antecedent rainfall was also found to be an indicator of runoff. Various weighting coefficients are currently being tested. Other weighting coefficients are currently being tested. Other characteristics will be studied as considered necessary.

Studies of agricultural drouths (plant production) in the Blacklands indicate approximately two months will occur on the average of once in two years when there will be not more than 0.25 inch of rain in any one 24-hour period. Criteria other than the '0.25 inch in any one 24-hour period' are being tried, but the study has not been completed.

2.1033, EFFECTS OF CULTURAL PRACTICES, SOIL MOISTURE LEVELS, AND FERTILITY LEVELS ON CITRUS TREE REACTION, AND ON SOIL PROPERTIES

R.F. LEYDEN, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: 1. Evaluate the effects of cultural practices, soil moisture levels, fertility levels, and their interactions on: (a) the growth of citrus trees (b) the quantity and quality of fruit produced (c) the cold tolerance of citrus trees (4) the prevalence of disease in citrus orchards. (2) Determine the influence of cultural practices, soil moisture levels, and fertility levels on: (a) the physical and chemical properties of the soil (b) the consumptive water use requirements of citrus orchards.

2.1034, CITRUS FERTILIZER TEST ON SEVERAL PRINCIPAL CITRUS SOIL TYPES IN THE LOWER RIO GRANDE VALLEY OF TEXAS

N.P. MAXWELL, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: 1. Determination of effect of varying amounts and ratios of fertilizer nutrients on yield and quality of citrus grown on different important citrus producing soil types. The differential response in yield and quality among varieties and species of citrus with varied fertility levels, soil types, and management practices such as (a) time method and rate of application of fertilizers, (b) time, method and rate of application of irrigation water, (c) kind and management of cover crops.

SUPPORTED BY Texas State Government

2.1035, ESTABLISHMENT AND MAINTENANCE OF VEGETATION ON HIGHWAY RIGHTS-OF-WAY

W.G. MCCULLY, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Project Objective: (1) To compare and improve specified methods of erosion control by determining requirements, planting materials and procedures for establishing a vegetative cover on finished slopes and other areas subject to soil erosion. (2) To adapt recommended agricultural methods of plant control to highway requirements.

2. WATER CYCLE

Description of Work Proposed: This project is a continuation of project S1291. Work under this research outline will be primarily in the field of vegetation establishment. This research will augment the testing and will provide an outlet for materials being evaluated under H988, 'Evaluation of Potentially Drought Resistant Grasses for the Southwest'. Outturn from this project should provide recommendations for planting or service basis for future work on grass establishment for reclamation or eroded or similar sites on range lands.

The work under the second objective will enlist the cooperation of other existing projects within the Texas Agricultural Experiment Station, but work under this project will be only on an opportunity basis or to solve specific problems.

SUPPORTED BY Texas State Government

2.1036, EVALUATION OF SUBIRRIGATION FOR CROP PRODUCTION

J.S. NEWMAN, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: 1. To develop engineering design data on the size of pipe, friction pressure loss, length of rows, size and type of outlet for different soils under field conditions. 2. To evaluate the effect of subsurface irrigation on plant growth and application efficiency. 3. To study the capillary movement of water in perforated plastic pipe buried at different depths and horizontal spacings in soil of different texture.

SUPPORTED BY Texas State Government

2.1037, SOIL MOISTURE STORAGE AND UTILIZATION.

P.A. RICH, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: 1. To determine relations between stored moisture and plant functions. 2. To develop methods of moisture storage and utilization. 3. To determine the effects of increased nutrients in stored moisture.

Description: Comparison of continuously cropped plots with alternate crop and fallow plots plus these two systems with different drill widths will be utilized to evaluate preseasonal and seasonal moisture storage methods. An addition of 60-30-0 to half the plots will be used to determine added nutrient effects plus stored moisture effects on plant characteristics.

SUPPORTED BY Texas State Government

2.1038, ROLE OF LIGHT QUALITY, ETC., ON TRANSPIRATION OF WATER LOSSES BY PLANTS

J.A. RUNKLES, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Determine role of light quality (spectrum wave lengths) affecting transpirational water losses by cotton, bean, and tomato plants under controlled conditions of environment. Special emphasis will be placed on the red and far-red parts of the light spectrum. Study interactions of light quality, temperature (soil and air), and relative humidity on water-use rates by cotton, bean, and tomato plants under controlled environmental conditions. Evaluate further a thermal method for measuring water flow rates in agricultural plants as affected by changes in light quality, temperature, and relative humidity. Evaluate and report data periodically.

DESCRIPTION OF WORK: All fundamental phases concerning light quality, soil and air temperatures; and relative humidity will be conducted under controlled and climatic conditions in the laboratory. Light quality will be accomplished by using different colored fluorescent tubes (blue, green, yellow, red). Infra-red source will be incandescent lamps. Radiation will be measured by a Beckman hemispherical radio-meter initially. Air and soil temperatures will range in combinations between 55 degrees and 115 degrees F. Relative humidity will range between 20% and 85%. Plant response to environment changes will be indicated by use of the thermoelectric method for measuring water flow rates in stem of selected plants.

2.1039, A STUDY OF THE MECHANISMS AND SUPPRESSION OF EVAPORATION OF WATER FROM SOILS

J.R. RUNKLES, Texas A & M University System, School of Agriculture, College Station, Texas 77843

The proposed research involves controlled environment and field experiments directed towards the suppression of evaporation from soils. The main objective of this investigation is to study the basic mechanism of evaporation from different soils and to develop the best method of suppression of these soils.

The controlled environment phase will study the important parameters alone or in combination as to their influences on the evaporation process. Both soil and atmospheric parameters will be studied. Mechanisms of suppression will be studied under controlled conditions.

The field phase will be concerned with extrapolating the best suppression mechanisms to field conditions. The important soil and atmospheric parameters will be measured under field conditions.

2.1040, CONTROL OF EVAPORATION AND TRANSPIRATION THROUGH SOIL, PLANT AND AIR - WATER INTERFACE MODIFICATIONS

J.R. RUNKLES, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

1. To study the basic influence of evaporation suppression by surface-active chemicals applied to soils and water. 2. To determine the influence of selected surface-active chemicals and soluble salts on evaporation from soils and water. 3. To determine the influence of selected chemical compounds and soluble salts on transpiration by plants. 4. To determine the influence of genetic leaf modifications (color, size and shape) on transpiration of cotton. 5. To analyze and report data periodically.

The research will utilize controlled environment chambers, greenhouse and field plots facilities to accomplish the objectives described above.

SUPPORTED BY Texas State Government

2.1041, INVESTIGATION OF A LINEAR MODEL TO DESCRIBE THE HYDROLOGIC PHENOMENON OF DRAINAGE BASINS

F.A. SCHMER, Texas A & M University System, Water Resources Institute, College Station, Texas 77843

This research is directed toward hydrologic research in small drainage basins. Small drainage basins will be utilized to evaluate a linear model. If this model is adequate for small watersheds, then its application to basins of any size would be similar to the empirical unit hydrograph approach that is presently being used by many hydrologists, but greater accuracy and flexibility should result. Three specific objectives of this research are: 1. To determine the applicability of available linear mathematical models to the rainfall-runoff hydrologic phenomenon in natural drainage basins. 2. To evaluate the ability of a specific lumped linear time-invariant system, the convolution relation, to adequately represent the rainfall-runoff hydrologic phenomenon of natural drainage basins. 3. To investigate possible relationships between the unit impulse response of the convolution relation and drainage basin characteristics provided the validity of the use of the convolution relation is substantiated.

2.1042, WATER POLLUTION FROM ERODED SEDIMENTS

E.T. SMERDON, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

2. WATER CYCLE

To investigate the nature of sediment transport in shallow flow with superimposed rainfall.

Description of Work Proposed: The study is directed to the problem of initial transport of eroded sediments from the point of detachment to streams in which the flow is sufficiently deep so that the effect of rainfall energy on the surface of the flow is negligible. The study will include the investigation of factors such as velocity distribution in clear and sediment-laden flows, shear distribution within the flow, suspended transport capacity, all as affected by rainfall of various intensity levels.

SUPPORTED BY Texas State Government

2.1043, PREDICTING SOLUTE MOVEMENT AND DISTRIBUTION IN SOILS

G.W. THOMAS, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Salts will be added to soil columns made up of important, representative soil types and then eluted with solvents. Measurements of spreading and the lag of solutes behind the water front will be taken. From these data, solute concentration vs. depth of soil curves for specified leaching situations will be obtained. Field data on movements of solutes also will be taken for comparison with idealized laboratory results.

To predict the shape and position of salt concentration curves in soils, the band spreading equations will be combined with chromatographic equations and corrected for the rate of hydrolysis. It is anticipated that realistic, workable and useable prediction equations will be the most important result of these studies.

SUPPORTED BY Texas State Government

2.1044, INVESTIGATION OF BLOSSOM-END ROT OF PEAR TOMATOES

UNKNOWN, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: (1) To determine the cause of blossom-end rot of pear tomatoes. (2) To determine the influence of different factors on blossom-end rot of pear tomatoes. (3) To determine the water transfer from fruit to other plant parts using a thermoelectric method. (4) To determine the influence of transpiration suppressants, growth regulators or plant modification on transpiration blossom-end rot, yield and other growth characteristics.

A hypothesis is proposed which states that blossom-end rot occurs due to loss of water from tomato fruits. The transfer of water to other plant parts is probably the most significant mechanism which causes blossom-end rot of pear tomatoes. It is the purpose of this research to clarify the proposed hypothesis and to evaluate the influence of different factors on loss or transfer of water from fruit to atmosphere or at plant parts. It is also the purpose of this investigation to try to find suitable transpiration suppressants. The influence of these possible suppressants or plant modifications on transpiration, blossom-end rot, yield and other plant growth characteristics will also be evaluated.

2.1045, FERTILIZER REQUIREMENTS OF CROPS GROWN IN DIFFERENT CROPPING SYSTEMS

H. WALKER, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: 1. Fertilizer requirements of cotton grown under natural rainfall and natural rainfall plus supplemental irrigation under continuous cotton and in a 6-year rotation of 3 years of alfalfa fertilized uniformly followed by 3 years of cotton. 2. Fertilizer requirements of corn grown under natural rainfall and natural rainfall plus supplemental irrigation under continuous corn in a 6-year rotation of 3 years alfalfa fertilized uniformly followed by 3 years of corn. 3. Fertilizer requirements of alfalfa grown under natural rainfall plus supplemental irrigation when fertilizer is applied every third year. 4. Relative merits of alfalfa-corn versus alfalfa-cotton systems under natural rainfall and natural rainfall plus supplemental irrigation.

SUPPORTED BY Texas State Government

2.1046, WATER TRANSFER FROM SOIL TO THE ATMOSPHERE AS RELATED TO CLIMATE AND SOIL PROPERTIES

C.W. WENDT, Texas A & M University System, School of Agriculture, College Station, Texas 77843

The transfer of water from the soil to the atmosphere will be investigated in relation to soil properties and atmospheric conditions. Evaporation will be measured with field lysimeters in conjunction with a complete micrometeorological measuring system. Evaporation of soil moisture will be related to soil water content, soil texture, porosity and surface roughness. The atmospheric parameters which will be related to evaporation are: solar radiation, wind speed, relative humidity, and air temperature.

The study will be conducted at the South Plains research and Extension Center at Lubbock, Texas.

2.1047, EVALUATION OF ESTUARINE DATA

C.R. CHAPMAN, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Increasing demands upon Gulf coast water resources are rapidly producing significant alterations and, in many cases, destruction of the estuarine and coastal marsh environment. Engineering construction projects, both small single-purpose units as well as large basin-wide developments, are being initiated with increasing frequency. The complexity of basin-wide developments and the large numbers of smaller projects makes it extremely difficult to treat each project in sufficient detail. Thus, it becomes increasingly evident that every expediency must be employed to assist with preconstruction studies and evaluations. This aim can be greatly facilitated by properly organizing and distributing existing data and information.

Project objectives are to inventory and organize existing published and unpublished data and information describing and relating to Gulf coast estuaries; make this data and information available in readily accessible or retrievable form; apply and include new data and information as it becomes available; and assist in establishing requirements for future estuarine research.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.1048, ECOLOGY OF WESTERN GULF ESTUARIES

W.L. TRENT, U.S. Dept. of Interior, Biological Laboratory, Fort Crockett - Galveston, Texas

Demands upon water resources along the coast of the Gulf of Mexico are rapidly altering the estuarine environment. These combined alterations disturb the integrity of large estuaries to the extent that entire biological systems may be significantly affected. Basic to an evaluation of the effects of estuarine alteration is knowledge of the interrelations of factors, such as nutrients, bottom types, marine organisms, and vegetation.

Project objectives are to (1) compare the productivity of natural estuarine habitats with areas altered by dredging, spoiling, bulkheading and filling; (2) determine practical methods for rehabilitating altered habitats so that productivity can be reestablished; and (3) determine management procedures for maintaining or increasing the productivity of estuarine areas.

SUPPORTED BY U.S. Dept. of Interior - Bu. Comm. Fish.

2.1049, CULTURAL PRACTICES OF VEGETABLE CROPS

J.H. KYLE, Texas A & M University System, Agricultural Experiment Sta., Lubbock, Texas

Cultural Practices to Aid Production of Vegetable Crops on the High Plains - 1. To determine the proper rate and placement of fertilizer for maximum yield and highest quality. 2. To study and develop better cultural practices which lead to higher production and better quality of vegetable crops. 3. To study the

2. WATER CYCLE

irrigation practices which lead to higher production and the conservation of water.

Research shall be undertaken to study onions and carrots. Plant populations, i.e. variable number of rows on a 40 inch bed, irrigation levels and fertility levels shall be the treatment variables in the experiment. The onions shall be grown as an early crop (planted about March 20) and the carrots shall be grown as a late crop (planted about July 20). Two replications shall be used in both tests with thirty- two foot experimental plots.

SUPPORTED BY Texas State Government

2.1050, IRRIGATION STUDIES FOR THE HIGH PLAINS

J.S. NEWMAN, Texas A & M University System, Agricultural Experiment Sta., *Lubbock, Texas*

Objectives: (1) To evaluate different methods of applying irrigation water to crops on the high plains for maximum irrigation water efficiency. (2) Investigate timing and rates of irrigation applications on major crops produced in the area. (3) Determine the consumptive use, water requirements, irrigation requirements, and moisture-fertility interactions for major crops produced in the area. (4) Determine the influence of moisture levels on yield and quality of produce for major crops in the area. Methods physical sites have been located on research center and on selected farms in the area. Standard equipment has been used to measure appropriate parameters for determinations listed in the objectives on cotton, grain sorghum, soybeans and castors. Yields and produce quality were taken and used as an indicator of the most acceptable combinations of cultural practices. Progress: (1) The water and irrigation requirements have been determined for present varieties and cultural practices on cotton, grain, sorghum, soybeans and castors. (2) New cultural and irrigation practices are being evaluated for use as adjustments to a diminishing supply of irrigation water anticipated in the not too distant future. (3) Standard irrigation research procedures used on commonly grown crops in the area are being used to research water and irrigation requirements for new crops adapted but not grown in the area and for new crops being grown on a limited basis in the area.

SUPPORTED BY Texas State Government

2.1051, SOIL MOISTURE SURVEY FOR SOUTH PLAINS OF NORTHWEST TEXAS

O.H. NEWTON, Texas Technological College, School of Agriculture, *Lubbock, Texas 79409*

Project Objective: To determine through use of the most modern soil moisture measuring devices, the content of subsurface soil moisture to a depth of four feet in all or a major part of the area described as the South Plains of West Texas. The size of the area to be sampled will be determined by the availability of funds.

Procedures: (1) Not less than eight nor more than fifteen observation sites will be established in each of at least ten counties and permanent access tubes installed from which soil moisture observations will be taken. (2) Observations will be selected after consultation with county agents and careful consideration given to soil types, drainage and other factors that might influence a representative evaluation. (3) Selection of the observation site and the installation of the access tube will be made only after requirements have been met and a pledge of full cooperation has been obtained from the property owner. (4) After selection of observation sites has been completed and access tubes installed, soil measurements will be taken annually during late October and early November and again in late February and early March. (5) Evaluation and analysis of the data will be completed as quickly as possible following each observation period and this data distributed to all agricultural interests throughout the South Plains.

SUPPORTED BY Texas State Government

2.1052, PHREATOPHYTE EVAPORATION RESEARCH

T.E. VANHYLCKAMA, U.S. Dept. of Interior, Water Resources Division, *Lubbock, Texas 79410*

The objective is to measure the use of ground water by saltcedar (*Tamarix pentandra*) in evapotranspirometers and to evaluate these data against those obtained by energy budget and mass transfer methods.

Six plastic-lined tanks 9 x 9 meters of surface and 4.5 meters deep were constructed and planted in saltcedar to the same density as the surroundings. The use of water from these tanks is being measured daily and at times more frequently. Ground water in the tanks can be maintained at different levels and the effects of depth to water on the transpiration and evaporation can be evaluated.

Five smaller tanks (6 x 6 meters and 2 meters deep) provide information on water losses from bare soil as well as on the effect of difference in salinity of the ground water on water use in vegetated tanks.

Equipment for measuring the energy budget as well as mass transfer components has been installed and data are recorded on potentiometers and other devices.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1053, IRRIGATION PRACTICES WITH RANGER PEACHES

U.A. RANDOLPH, Texas A & M University System, Agricultural Experiment Sta., *Montague, Texas*

To obtain information on the effect of irrigation at different periods of fruit development on fruit size and yield of the Ranger peach.

Description of work proposed: Four irrigation treatments designed to insure adequate available soil moisture at various intervals prior to harvest will be compared. Fruit size and total yield will be measured.

SUPPORTED BY Texas State Government

2.1054, PRECIPITATION CHARACTERISTICS INFLUENCING RUNOFF FROM WATERSHEDS IN THE SOUTHERN PLAINS

W.G. KNISEL, U.S. Dept. of Agriculture, *Temple, Texas*

Object: To develop basic information on amounts, duration, areal and seasonal distribution, storm paths and other characteristics of rainfall as affected by geographic location, topographic location, and other factors, to the extent that the characteristics influence runoff from watersheds.

Plan of Work: The study is carried on by means of networks of recording raingages in the vicinity of Chickasha, Oklahoma; Riesel, Texas; and Sonora, Texas. Data from the Chickasha location are made available to the Weather Bureau in connection with development and evaluation of radar for precipitation measurements.

SUPPORTED BY U.S. Dept. of Agriculture

2.1055, THE ROLE OF SOIL STRUCTURE IN CROP PRODUCTION AND METHODS FOR IMPROVING SOIL PHYSICAL CONDITIONS

C.J. GERARD, Texas A & M University System, Agricultural Experiment Sta., *Weslaco, Texas*

Objectives: 1. To inventory and assess changes which have occurred in soil structure as a result of continued cropping in major agricultural areas in Texas. 2. To study of soil structure on growth of plants and the effects roots and crop residues on formation and stabilization of soil structures. 3. To develop or improve methods for measuring and characterizing soil structure. 4. To determine influence of soil structure on water movement and storage. 5. To develop principles which may increase our understanding of soil structure and from which new management practices may be developed.

The research this year has been concerned with (1) the effect of selected cationic, anionic and nonionic surfactants on clays and (2) the hydraulic conductivity of soils in the unsaturated state. It has been found that anionics had no effect on the d-spacing of montmorillonite and did not interfere with hydration of clay surfaces. Their effects on soil physical properties were directly related to the lowering of surface tension of the liquid

2. WATER CYCLE

phase. Cationics were strongly adsorbed by the clay surfaces through ionic bonding in amounts equal to or even greater than the cation exchange capacities of the clays. Their presence on clays significantly reduced hydration and water-content to the extent of making clay surfaces completely hydrophobic at the high treatment rates. Their effects on soil physical properties were directly related to the degree of hydrophobicity imparted. Nonionics were adsorbed by hydrogen-bonding of polar-active groups to oxygen rich clay surfaces. Their sorption energy was somewhat greater than that of water, and they displaced water when adsorbed.

The hydraulic conductivity (unsaturated) of Norwood silt loam has been investigated using the steady state method and the modified transient flow system. At a moisture content of 25% as determined in the lab of about .2 to .3 cm/min.

2.1056, THE EFFECT OF TILLAGE AND ORGANIC MULCHES UPON SOIL MOISTURE MOVEMENT AND SOIL TEMPERATURES IN THE LOWER RIO GRANDE

C.J. GERARD, Texas A & M University System, Agricultural Experiment Sta., Weslaco, Texas

The use of petroleum resin and other covers to modify the environment of summer planted seeds and subsequent young seedlings shows promise with some crops.

The relationship between soil temperature and 1/2 inch and stand was established for peppers. Soil temperatures between 110 to 115 degrees F at 1/2' depth caused a seed dormancy reaction in the case of peppers. Carrots were more sensitive to high soil temperature. Damping off young seedlings was significantly related with surface moisture level (0-2 inch depth). Plans are to continue evaporation and temperature studies under different covers through 1966.

2.1057, UNDERSTANDING AND IMPROVING SOIL-PLANT-ATMOSPHERIC RELATIONSHIPS FOR MORE EFFICIENT UTILIZATION OF WATER

C.L. WIEGAND, U.S. Dept. of Agriculture, Weslaco, Texas

Object: To develop basic knowledge regarding the role of soil and atmospheric factors on the use of water in plant growth processes; to devise procedures based on soil-plant-atmospheric relationships for more efficient timing and use of irrigation water in plant growth; and to study the effects of modified soil microclimate on plant growth and water utilization.

Plan of Work: Experiments will be conducted in (1) controlled growth chambers to determine the effects of soil moisture suction on root aeration, water movement, evaporation, and uptake by plant roots; and the effects of light intensity, temperature, and humidity on water use and plant growth; and (2) greenhouse, laboratory, lysimeter, and specifically controlled field experiments to study the interacting effects of soil moisture properties, water tables, microclimatic variations and plant characteristics on water use in plant growth processes. Basic studies will be made of the mechanism of water transfer from the soil into the plant. Methods for irrigation timing will be developed to obtain efficient plant growth and water conservation and use. Studies of ways to modify the soil microclimate, including moisture and temperature, for more efficient utilization of water will be conducted.

Cooperation: Texas Agricultural Experiment Station; SCS; Agricultural Extension Service; soil conservation districts.

2.1058, CALCULATION OF TEMPERATURE AND PRECIPITATION VALUES

G.L. ASHCROFT, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: 1. To determine the probabilities for selected precipitation values to occur in weekly periods. 2. To calculate the probabilities for critical temperature values to occur during certain periods. 3. To calculate the probabilities of degree-day-totals coming in certain ranges.

Description of work proposed: 1. To fit an incomplete-distribution to the rainfall data. 2. To fit a normal distribution to the critical temperature data. 3. To find a good distribution to fit the degree-total-date.

2.1059, ELECTRONIC ANALOG MODEL STUDIES OF RIVER BASINS

J.M. BAGLEY, Utah State University, School of Engineering, Logan, Utah 84321

The basic hydrologic processing of precipitation, snowmelt, surface and subsurface runoff, groundwater storage and movement, evapotranspiration, streamflow, etc., are being modeled electronically as a complete hydrologic system. Model will be used to predict performance of various parts of the hydrologic system resulting from proposed water management and water development changes.

The project was started in 1964. The model is completed. Verification and utility in various problem situations is being explored. Plans are now underway to add considerably more capacity in order to handle a wider variety of problems more expeditiously and to permit greater sophistication and detail in hydrologic definition.

SUPPORTED BY Utah State Government

2.1060, CHARACTERISTICS OF UTAH STREAMS

J.M. BAGLEY, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

A comprehensive analysis of characteristics of Utah streams is being made. Streamflow data from only those gaging stations measuring 'natural' flow (free from any man-made regulation or division upstream), and having a relatively long and continuous record were selected for analysis.

Analyses include magnitude of error in determination of mean annual and seasonal flow, as affected by number of years of record; serial correlation analysis to investigate nature of carryover and lag; analysis of high and low flow sequences and their probabilities of occurrence; and the monthly flow exceedence probabilities. Regional and geographic patterns in flow characteristics are being sought.

Utah State University

2.1061, INCIPIENT MOTION OF ROUGHNESS ELEMENTS IN TURBULENT OPEN CHANNEL FLOW

C.G. CLYDE, Utah State University, School of Engineering, Logan, Utah 84321

The objectives of the proposed research are: 1. To develop suitable criteria for the incipient motion of large roughness elements in turbulent open channel flow under prototype conditions. The parameters to be utilized are time-dependent lift and drag forces, intensity of turbulence, edge velocity, velocity profiles and gradients, flow depths, discharge, and energy gradient. 2. To measure the flow resistance of large roughness elements in order to extend present flow resistance data to large elements and, also, to verify whether or not particular criteria developed from research on various smaller roughness elements by other investigators are applicable to the larger roughnesses. 3. To study the interrelationships between time-dependent lift and drag forces, intensity of turbulence, probability of incipient motion, flow resistance, and the other hydraulic parameters listed under Item 1.

SUPPORTED BY U.S. National Science Foundation

2.1062, INCIPIENT MOTION OF LARGE ROUGHNESS ELEMENTS IN TURBULENT OPEN CHANNEL FLOW

C.G. CLYDE, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

Suitable criteria will be developed for the incipient motion of large roughness elements (hemispheres and spheres varying in

2. WATER CYCLE

diameter between 3 and 12 inches) in turbulent open channel flow under prototype conditions. The parameters to be utilized are time-dependent lift and drag forces, intensity of turbulence, edge velocity, velocity profiles, and gradients, flow depths, discharge, and energy gradient.

The flow resistance of large roughness elements will be measured in order to extend present flow resistance data to large elements and, also to verify whether or not particular criteria developed from research on various smaller roughness elements by other investigators are applicable to the larger roughnesses.

The interrelationships between time-dependent lift and drag forces, intensity of turbulence, probability of incipient motion, flow resistance, and other hydraulic parameters listed under Item 1 will be studied.

2.1063, EFFECTS OF RANGE PLANT FOLLIAGE REMOVAL ON SOIL MOISTURE REGIME

G.B. COLTHARP, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

1. To determine the effects of light (25%), medium (50%), and heavy (75%) levels of foliage removal from native range plants on soil moisture regime. 2. To determine the effects of season of foliage removal from native range plants on soil moisture regime.

Proposed work: Small circular plots (approx. 50 sq. ft.) will be located in typical summer range, i.e., native grass and browse. Plots will be subjected to light, medium, and heavy foliage removal treatment by means of clipping. Clipping dates will be: June 1 for one set of plots; June 1, July 1, August 1, and September 1 for the other set of plots. There will be three replications of each treatment combination. Soil moisture will be sampled, by means of a neutron scattering device, immediately prior to clipping and at bi-weekly intervals thereafter. Data will be analysed by means of analysis of variance technique for a randomized block plot design.

SUPPORTED BY U.S. Dept. of Agriculture

2.1064, EVAPORATION AND CLIMATIC STUDIES

J.E. FLETCHER, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

Evaporation, evapotranspiration, and sublimation from snowpacks are all functions of the climatic environment and constitute the principal water losses to the United States. An investigation of the climatic factors which affect the quantity, quality, and timing of these losses is being conducted in order for a more precise formulation of the location and character of water supply utilization to be developed.

SUPPORTED BY Utah State Government
Utah State University

2.1065, SNOW COVER COMPACTION AND SOIL MOISTURE

J.E. FLETCHER, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

Plants growing under areas where snow has been compacted frequently show better growth than adjacent plants following melting of undisturbed snow. Moisture levels in the soil are followed and observations of the plants between compacted and uncompact areas are being made.

2.1067, EFFECTS OF PINYON-JUNIPER CONVERSION ON WATERSHED VALUES IN UTAH

G.F. GIFFORD, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: To determine the water budget of natural stands of pinyon-juniper versus areas which have been cleared and seeded; to determine the effects of conversion on soil physical properties and stability, runoff, sediment movement and production; to ecologically evaluate sites before and after as to phenology, composition, and vegetative production; to evaluate the economics of conversion practices in terms of watershed values and multiple use relations; and to obtain data necessary for the determination of hydrologic soil-cover complex numbers from pinyon-juniper sites before and after treatment.

Procedures: Three small watersheds will be selected at two widely separated sites in Utah, within the pinyon-juniper vegetative type, representative of similar areas on which conversion by chaining is a standard procedure. Each will be instrumented for climatic data, runoff and sediment yields, soil moisture and temperatures, etc. Detailed soil and vegetative samplings and measurements will be made. When satisfactory calibration has been obtained, two watersheds at each site will be treated (1) double chains, leave debris in place, broadcast seeding, (2) one-way chain, windrow and burn debris, drill seeding.

SUPPORTED BY U.S. Dept. of Interior - Bu. Land Mgmt.

2.1068, DATA REDUCTION METHODS FOR STREAMFLOW FROM SMALL, WILDLAND WATERSHEDS

G.E. HART, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: 1. To develop electronic computer integration techniques for the reduction of streamflow data. 2. To evaluate long-term streamflow record for undisturbed watersheds in the Wasatch Mountains.

Abstract of Procedures: Manual methods of compiling and computing discharge from streamflow recorders will be modified to permit semi-automated reduction by electronic computer. A general program will be developed to cover a variety of conditions, both for the input and output. Time and water level values will be transcribed to cards in sufficient detail for reconstruction of the hydrography by machine methods.

SUPPORTED BY U.S. Dept. of Agriculture

2.1069, REMOTE ELECTRO-MAGNETIC SENSORS FOR DETECTING TRANSPIRATIONAL WATER USE BY PLANTS SUBJECTED TO VARIOUS FOLIAR CHEMICAL TREATMENTS

F.W. HAWS, Utah State University, Utah Ctr. For Water Resour., Logan, Utah 84321

This project has a dual purpose: (1) to evaluate the usefulness of remote electro-magnetic sensors to detect amounts of transpirational use of water by vegetation, and (2) to evaluate various foliar chemical treatments for reducing transpirational water losses. Spectral reflectance, absorption and thermal emission characteristics of typical forest vegetation and forest soils will be determined. If spectral changes occur with moisture stress a remote sensing technique will be devised to measure and evaluate these changes. Anti-transpirants will be applied to a forest test plot which has been instrumented to measure moisture use. Various anti-transpirants will be evaluated by measuring moisture regime with remote sensors, sap velocity meters, and soil moisture probes.

2.1070, EFFECT OF VARIOUS IRRIGATION TECHNIQUES ON SOIL AERATION, SOIL STRUCTURE, AND CROP RESPONSE

J. KELLER, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

1. A laboratory study to determine the influence of various irrigation techniques on soil structure. 2. To correlate the laboratory study to field response by a field study. 3. To establish a procedure for predicting field responses to the irrigation techniques studies.

The laboratory study will be conducted on soils from possible field sites. The major variables will be water application rate, soil moisture and soil type. Crop response studies will be made at the sites where the laboratory soil samples were taken.

SUPPORTED BY Utah State Government

2.1071, STORAGE AND CONVEYANCE OF IRRIGATION WATER

C.W. LAURITZEN, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: To develop (1) methods and materials for the control of seepage and channel stabilization; (2) equipment and construction practices designed to reduce the cost of lining; (3) new methods of conveying water on the farm.

Description of Work Proposed: Properties of materials expected to influence the effectiveness of a lining material will be measured. Measurements will include: (1) permeability and stability of materials, (2) susceptibility to biological deterioration, (3) resistance to weathering, (4) resistance to damage from impact, puncture, hydrostatic pressure, and other types of mechanical damage, and (5) resistance to plant penetration.

Materials investigated will include: (1) earth, (2) asphalt, (3) concrete, (4) metal, (5) chemical stabilizers, and (6) structures fabricated from asphalt, plastics, and elastomers.

The use of new materials frequently necessitates the development of new techniques in construction involving the design and testing of equipment for handling, compacting, joining, and protecting the lining material and other conveyance structures. Some of these factors can only be evaluated in operating canals and reservoirs. Evaluation takes many forms, depending upon the lining employed: (1) seepage measurements, (2) permeability and apparent specific volume determinations, (3) measurement to determine physical and chemical properties, and (4) observation of usual deterioration, such as breaks, cracks, and checking.

2.1072, DEVELOPMENT OF IMPROVED SNOW SURVEYING AND STREAM-FLOW FORECASTING TECHNIQUES

C.H. MILLIGAN, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

In this project data on antecedent streamflow, as measured by the U.S. Geological Survey, rainfall, temperature, soil moisture, and accumulative winter snowfall will be collected for the Logan River watershed. These antecedent data will be correlated with streamflow for the irrigation season. Functional relationships thus developed will be utilized for advance information will guide water management. This advance information is especially valuable in years of drought. The objectives of this project are to develop improved techniques and equipment for measurement of the variables which affect streamflow and to improve forecasting relationships, all so that more accurate forecasts of expected streamflow can be made.

2.1074, UTAH ATMOSPHERIC WATER RESOURCES (THE WASATCH WEATHER MODIFICATION PROJECT)

G.W. REYNOLDS, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

The purpose of this study is to quantify the effects of cloud seeding on the winter snowpack in the Wasatch Mountains in Utah. Initially, at least, the seeding is to be with silver iodide from two mountain top and two valley generators, along the Wasatch Front, near Ogden. The evaluation is to be based primarily upon data from 150-200 telemetering precipitation gages. Approximately 40 of these stations are to be in operation during the 1967-68 winter. These measurements are to be supported with radar and special rawinsonde observations.

Support studies in several areas are required: silver iodide background and plume nuclei studies; inadvertent cloud seeding by air pollution; precipitation analysis for silver and iodine; time and space synoptic climatology-cloud-precipitation studies; and hydrologic studies. These support studies have only been started. The bulk of the effort thus far has been on the development, adaptation, manufacture, and installation of the telemetering system (remote stations and terminal readout system).

The evaluation system will involve the comparison of natural and seeded precipitation patterns. Variations in both time and space will be considered. Both target versus control and seeded versus unseeded comparisons are to be made. Non-parametric statistical significance tests will be applied.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

2.1075, THE SIMULATION OF HYDROLOGIC EVENTS IN ARID REGIONS

J.P. RILEY, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321

The hydrologic characteristics of watersheds in semiarid regions are dependent upon many variable and often interrelated factors. A quantitative knowledge of these factors and of their relative influence upon the system as a whole is needed in order to improve the efficiency of watershed management in these areas. In an attempt to develop a comprehensive simulation model of a semiarid watershed, research workers in the Agricultural Research Service considered the electronic analog computer, and a cooperative research agreement was subsequently signed with Utah State University.

Analog modeling concepts are based upon the development of basic relationships which describe the various processes which occur within the surface hydrologic system of a semiarid watershed. Once established, the model is applicable to any particular geographic unit by determining the appropriate constants of the hydrologic equations. The analog computer is ideally suited to the many time-dependent differential equations which are encountered in hydrologic systems.

To test individual equations and to verify the model, a sub-basin of Walnut Gulch Watershed in southern Arizona was simulated. In preliminary tests, close agreement was achieved between the observed and computed runoff hydrographs for a single storm. Some progress has also been made in the development of an analog technique to plot isohyetal lines corresponding to selected time intervals during the course of a storm.

2. WATER CYCLE

The project was initiated in February 1965 and has no specific termination date. It is however, subject to renewal on July 1 of each year.

2.1076, PREDICTION OF WATER MOVEMENT IN UN-SATURATED SOILS

S.A. TAYLOR, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: 1. To delineate the influence of structural and electrostatic differences as well as solute concentration and energy gradients upon the movement of solutes, energy, and water in soils. 2. To devise quantitative expressions describing the simultaneous movement of water, solutes, and energy in soil.

Description of Work: 1. Simultaneous measurements of the flow of different kinds of matter and energy through soil materials that have been subjected to simultaneous driving forces will need further developing as their extension to other materials comes about. The results of such measurements will be used to calculate transfer coefficients. These coefficients will then be tested by experimentally verifying the flow equations. 2. The systems of interest will be subjected to further theoretical analyses, in order to find general flow equations. The appropriate equations will be tested using the data collected in connection with objective 1, and by other cooperators in Western Regional Research Project W-68.

SUPPORTED BY U.S. Dept. of Agriculture
Utah State Government

2.1077, WATER-SOIL-PLANT RELATIONS

S.A. TAYLOR, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: 1. Investigate relationships between water stress in root media and internal water status of plants as affected by environment and plant development. 2. Evaluate effect of plant structures, physiological processes and transpiration retardants on water movement and loss from plants. 3. Seek unification of divergent hypotheses concerning soil water and its effect on plants as a basis for developing concepts leading to more efficient use of water.

Description of Work: 1. Measurement of the different components of the water potential (total, osmotic, and solute) in plants will be made using vapor pressure psychrometers. 2. The influence of respiration inhibitors, oxygen concentration, and pressure on the water potential, respiration potential, and permeability of root systems will be made. 3. Various explanations of water transport in the soil-plant-atmosphere system will be studied theoretically and quantitatively using simultaneous flow of water, heat, salts and other materials and forms of energy through the system.

Utah State Government

2.1078, COMBINED INFLUENCE OF ATMOSPHERIC DESICCATION AND SOIL WATER POTENTIAL ON THE IRRIGATION NEED AND WATER POTENTIAL OF PLANTS

S.A. TAYLOR, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objective: To integrate the parameters of atmospheric desiccation, soil water potential, and the thermodynamic condition of internal plant water as a precise method to determine irrigation need and practice.

Procedure: Three different irrigation regimes will be used to maintain the soil water potential in the root zone of mature peach trees within predetermined limits. Leaf water content will be measured continuously. Relative turgidity measurements and direct measurements of plant water potential will be made on plant tissue samples. Atmospheric desiccating conditions will be characterized by potential evapotranspiration as calculated from a Penman equation. If possible the equation will be modified to account for advective energy. The necessary parameters in the equation will be measured continuously using self-recording equipment recently developed and tested at Utah State University.

SUPPORTED BY U.S. Dept. of Agriculture

2.1079, HYDRODYNAMIC FORCES ON NON-COHESIVE BED PARTICLES INCLUDING SEEPAGE

G.Z. WATTERS, Utah State University, School of Engineering, Logan, Utah 84321

This research will consist of an investigation of the hydrodynamic forces on spheres placed in the bottom of a flowing open channel and subjected to a seepage flow both into and out of the channel. These spheres represent idealized noncohesive bed particles normally found in mobile-boundary water conveyance channels.

The experimental apparatus is a dynamically similar model of the prototype bed with 3-inch diameter spheres being used to represent the bed particles. A mineral oil with a viscosity about 100 times that of water will be used to insure dynamic similarity between the model and a prototype bed with particles about 0.5 to 1.0 mm in diameter.

The forces will be measured with a strain-gage dynamometer under various conditions of seepage and channel flow. The contributions to the total hydrodynamic force of the seepage flow and the external channel flow will be determined separately. The use of spheres to model the channel bed will eliminate the statistical scatter inherent when natural bed materials are used and provide definitive results which will reveal the conditions under which seepage is important in influencing the forces on bed particles.

SUPPORTED BY U.S. National Science Foundation

2.1080, SOIL AND CLIMATE EFFECTS ON IRRIGATION WATER REQUIREMENTS

L.S. WILLARDSON, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

1. To determine whether the same consumptive use coefficients can be used under different climatic conditions. 2. To compare field measurements of consumptive use with current methods of calculating consumptive use from weather data. 3. To test a technique for separating measured consumptive use into components of evapotranspiration and deep percolation.

Studies will be conducted at 3 locations having different growing seasons. Laketown (Latitude 41.8, Seasonal F 23.85), Richmond (Latitude 41.9, Seasonal F 30.39), and Logan (Latitude 41.7, Seasonal F 38.78), Utah having been selected. Irrigated fields planted either to spring or fall grain and fields of established alfalfa will be used. Study sites will be selected with the help of county agents and the local Soil Conservation Service personnel. Soil classification information will be obtained. Neutron meter tubes for soil moisture measurements will be installed in the normal cropped area before growth starts in the spring. Other tubes will be installed in a representative location nearby in the same field.

2.1082, HYDROLOGY OF THE SUB-LAKE SEDIMENTS BENEATH GREAT SALT LAKE

W.P. HEWITT, Univ. of Utah, State Geolog. & Min. Surv., Salt Lake City, Utah 84112

In those holes being drilled to determine the engineering characteristics of the bottom sediments of Great Salt Lake, and to test for deep brines, records are to be made of water pressures within the sediments at various depths beneath the brine-mud contact. It is planned to install casing in a few selected holes to study the transmissibility of water within these sub-Lake sediments. From data thus obtained, it is hoped that knowledge will be obtained that pertains to sub-Lake recharge.

This program will be commenced during the fiscal year that starts July 1, 1965. Status: work deferred until funds are available for casing and measuring devices. Will most likely be coordinated as a cooperative project with other State agencies and the U.S. Geological Survey.

SUPPORTED BY Utah State Government

2.1083, CARBON, OXYGEN AND SULFUR ISOTOPES AND THE ORIGIN AND SOURCES OF URANIUM MINERALIZATION

M.L. JENSEN, Univ. of Utah, Graduate School, Salt Lake City, Utah 84112

During past years, this contract has provided diagnostic evidence of the mechanism by which sandstone-type uranium deposits form. This evidence consists of the analytical isotopic analyses of sulfur and carbon stable isotopes indicating that CO₂ and H₂S, derived from sulfur reducing anaerobes, has provided the effective reductant, H₂S, that has concentrated insoluble tetravalent uranium from solutions carrying soluble hexavalent uranium that transit zones containing the reductant H₂S.

Although the mechanism for the concentration of uranium is now known, it is most important to have information on the sources of the metal. At the present time, therefore, this research contract is studying oxygen isotopes derived from uranium oxides, quartz, silicates, and oxide minerals that occur intimately associated with the uranium deposits. Using the diagnostic isotopic ratios of 016/018 of uranium, etc., it should be possible to determine 1) the influence of bacterial activity on the genesis of these deposits and 2) the isotopic composition and genesis of the transporting aqueous medium in light of 016/018 studies from which the uranium assemblages were deposited.

Finally, in order to have a better understanding of the isotopic - temperature relationships of the oxygen bearing solutions, laboratory experiments are being done to determine the isotopic exchange equilibrium reactions between water - uranium oxide and water - uranium oxide - carbon dioxide systems. This information will enable us to evaluate post depositional isotopic exchange of primary uranium oxides with local ground waters and with atmospheric oxygen. If the data can be extrapolated to higher temperatures, the data may be applied to uranium bearing minerals in pegmatites.

SUPPORTED BY U.S. Atomic Energy Commission

2.1084, AUTECOLOGICAL STUDIES ON SOME DOMINANT PHYTOPLANKTON SPECIES OF LAKE CHAMPLAIN

P.W. COOK, Univ. of Vermont, Graduate School, Burlington, Vermont 05401

At the present time, the phytoplankton of Lake Champlain seems to be characteristic of mesotrophic conditions with a trend toward eutrophication in some of the more isolated embayments. Very little data is available on the ecology of some of the dominant organisms and *Tabellaria fenestrata*, *Coelosphaerium naegelianum*, and *Aphanizomenon flos-aquae* have been chosen for detailed consideration. Attempts will be made to correlate quantitative estimates of these species with physico-chemical data collected as part of the general limnological program of the Lake Champlain Studies Center. Chlorophyll content will be used as an indirect measurement of total phyto-plankton; differential counts

will be used to obtain semi-quantitative data on the more common species. If feasible, studies of the nutrition of the selected species will be initiated.

2.1085, PARAMETERIZATION OF THE OBSERVED HYDROGRAPH AS A MEANS OF UNDERSTANDING RUN-OFF PHENOMENA FROM SMALL WATERSHEDS

R.N. DOWNER, Univ. of Vermont, School of Engineering, Burlington, Vermont 05401

The primary objective of this investigation will be to develop an analytical method of fitting a mathematical model to the observed hydrograph and to express this model by parameters which can be related to measurable watershed characteristics. By establishing meaningful relationships between the model parameters and the characteristics of the watershed it should be possible to predict hydrographs for certain known contributory conditions.

The study will involve the fitting by means of the computer of a form of the incomplete gamma function to the observed hydrographs from a small watershed. Incidental to this work will be the establishment of criteria for goodness of fit. Once fits have been made for many storms statistical procedures will be used to establish relationships between the parameters of the hydrograph and the causative factors. Testing of the methodology will be carried out with the cooperation of the Sleepers River Research Watershed operated by the USDA-ARS at Danville, Vermont. Having developed adequate relationships between the parameters of the hydrograph and their causative factors for a gaged watershed, an attempt will be made to extend their methodology to ungaged watersheds typical of the northeast.

2.1086, CHEMICAL CHARACTERISTICS OF PRECIPITATION FALLING IN CHAMPLAIN VALLEY

E.B. HENSON, Univ. of Vermont, Graduate School, Burlington, Vermont 05401

Rain and snow will be collected from several stations as it falls to the ground. This water will be analysed for major cations (Ca, Mg, Na, K) present and the anions HCO₃, Cl, SO₄, and PO₄. The total alkalinity or acidity, pH. Conductivity will also be determined, when possible. Special rain buckets of inert plastic will be placed in strategic locations in the Champlain basin. Some will be placed on the New York Shore, some in the middle of the lake, and a number of collectors will be located in Vermont. The precipitation from a complete storm sequence will be collected in most instances; records will be maintained by the U.S. Weather Bureau in Burlington as to the type of precipitation.

From the analyses of the water in these collections, it is anticipated that some general conclusions can be made as to the chemical nature of the water that falls in the Champlain watershed, and that we therefore will have some knowledge of the amount of nutritive or contaminating load that is added to the local hydrological scene.

2.1087, BOTTOM SEDIMENTS OF LAKE CHAMPLAIN

A.S. HUNT, Univ. of Vermont, State Resources Res. Center, Burlington, Vermont 05401

A reconnaissance study has been undertaken to collect data on the physical, chemical, and mineralogical properties of the sediments at the sediment surface and at depth in Lake Champlain. The grain size is being measured in order to study current, erosion, and sediment transport. Grain size is also related to organic content, clay mineralogy, benthonic organisms and other dependent variables. In order to better understand the relationship between the sediments discharged into the lake and the lake's waters, chemical and mineralogical analyses of selected sediment samples is being undertaken

2. WATER CYCLE

A grid system has been used to select the sample sites which are located by transit. Surface samples are collected with a grab sampler; cores are collected using a gravity and Mackereth corer. The grain size is being determined using a settling tube and hydrometer methods and the data is processed by means of a computer program. The mineral content of the sediments is being studied using X-ray diffraction methods, magnetic separation, and other standard procedures. Chemical analyses are performed using atomic absorption and other conventional methods.

2.1088, LIMNOLOGY OF LAKE CHAMPLAIN

M. POTASH, Univ. of Vermont, State Resources Res. Center,
Burlington, Vermont 05401

The Objectives of the project are twofold; (1) to carry out field studies on Lake Champlain to determine, as far as possible, its physical, chemical, and biological characteristics; and (2) to continue long-term studies to determine whether these characteristics are being altered in any harmful way, or in any region of the lake, by the addition of pollutants.

Immediate research will concentrate on obtaining further descriptive information on such characteristics as temperature, light transparency, oxygen, pH, carbon dioxide, nutrients, currents and water flow, and bottom sediments. After the basic character of the lake had been described, continued research will be carried out to determine the biological character of the lake. As far as possible, research will emphasize the distribution and quantity of phytoplankton, zooplankton, benthic organisms, correlating their patterns with environmental data previously obtained.

2.1089, GLACIAL GEOLOGY OF THE CHAMPLAIN VALLEY

W.P. WAGNER, Univ. of Vermont, Graduate School, Burlington,
Vermont 05401

The prime objective is to determine the Pleistocene (Ice Ages) glacial history of the Champlain Valley. Glacial deposits around Lake Champlain will be studied and mapped using aerial photographs and topographic maps and the other usual field and laboratory techniques. In addition, the clay mineralogy of tills will be studied by Differential Thermal Analysis. Sediment analyses will be treated statistically with the aid of a computer.

A secondary objective is to determine whether or not an interaction of glacial ice and ancient Lake Champlain water resulted in similar topographic and sediment characteristics as the principal investigator found in Michigan and Alberta, Canada. The techniques involved are the same as outlined above.

2.1090, SOIL WETTABILITY AND TREATMENT IN RELATION TO WATER MOVEMENT IN SOILS

E.G. DUNFORD, U.S. Dept. of Agriculture, Forest Service,
Arlington, Virginia 22209

Object: To provide understanding of soil wettability, its effect on infiltration, retention, and release water, and the feasibility of modifying wettability through application of wetting agents.

Plan of Work: The investigator will conduct most of this research in the laboratory. Soils with variable properties of wettability, organic matter, mineralogy, and surface area will be packed in columns and wetting agents will be flowed through the columns to determine sorption, etc. He will attempt to extract and identify the active material of nonwettability. The physical effect of wetting agents will be studied and waterflow through porous media with various surface properties will be measured.

SUPPORTED BY U.S. Dept. of Agriculture

2.1091, UNSTEADY FLOW AND SALINE INTRUSION IN ESTUARIES

R.A. BALTZER, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

It is of fundamental importance to recognize that flow in natural channels is basically unsteady flow. To be sure, the degree of its unsteadiness is often of such minor significance that, with sound reason, such flow can be assumed to be steady flow, thereby taking advantage of greatly simplified analytic representation. Nevertheless, proper and thorough understanding of the mechanics of unsteady flow is important per se in determining the discharge of regulated streams, in flood routing, in determining flows in tidal reaches of homogeneous density, and, in fact, in any situation where open-channel flow cannot be assumed to be steady flow. Moreover, an understanding of the mechanics of unsteady flow is fundamental to improving the understanding of saline intrusion and diffusion in estuaries.

The ultimate objective of this investigation is the development of mathematical models representing unsteady open-channel flow, particularly as associated with estuarine channels. These models, hopefully, could then be used to predict-- or using certain field obtained parameters -- to determine such quantities as outflow, saline intrusion, and effects of channel changes upon flow.

A thorough appraisal of present knowledge of unsteady, open-channel flow is being conducted, including categorization of flow types and their required mathematical representation. Mathematical models will be derived and evaluated utilizing various solution techniques employing both analog and high-speed digital computers. Selected field data will be employed in the evaluation process.

2.1092, REGIONAL HYDROLOGIC SYSTEM ANALYSES (HYDRODYNAMICS)

R.R. BENNETT, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

The general objective is to determine the degree of significance of the factors that control or affect regional ground-water flow patterns in large hydrologic systems and to determine the principles of the functional nature of permeability distribution in granular sediments so that physical characteristics of hydrologic systems can be predicted. Two hydrologic systems are being used as prototypes. The field data and samples collected from the prototypes are being analyzed in the laboratory for directional permeability, fabric orientation and grain-size distribution. This project is being conducted in conjunction with the project, 'Permeability distribution and sedimentational features,' J. D. Bredehoeft, Project Leader.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1093, MECHANICS OF GROUND-WATER FLOW

H.H. COOPER, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

Mathematical analyses and analog studies of the movements of water in underground reservoirs provide a theoretical background for methods and techniques and the criteria for sound judgment in water management. Current studies are concerned with movements in anisotropic aquifers and in multi-aquifer systems, induced recharge from surface streams, and the response of water levels in wells to earthquakes.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1094, MINERALOGIC CONTROLS ON CHEMISTRY OF GROUND WATER

B.B. HANSHAW, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

Results of Laboratory investigations of the behavior of compacted clays as semi-permeable or osmotic membranes indicate that they are capable of affecting the chemistry of subsurface water and the fluid pressure. Salt filtering occurs when a saline

2. WATER CYCLE

solution is forced through compacted clay. Where a pressure differential exists across a body of shale, this process may be effective in increasing the salinity on the high pressure side of the membrane. The ability of shale to act as an osmotic membrane could also be a factor in the occurrence of anomalously low fluid pressures in parts of some sedimentary basins.

Compacted clay membrane electrodes have been used to study the action distribution coefficient between the clay and an internal solution. Preliminary results suggest that the distribution coefficient (exchange constant) varies as a function of compaction pressure.

Research into the use of C dating of ground waters is being studied along with a study of other isotopic equilibria in ground water in an attempt to understand better the rate, direction of movement, and recharge of ground-water aquifers.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1095, MINERAL-WATER INTERACTION IN SALINE ENVIRONMENTS

B.F. JONES, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

The chief processes being considered are evaporative dissolved-solid concentration, solid-solute reaction, mineral precipitation and re-solution, and compositional variation resulting from hydrographic fluctuation. Pilot study of the Deep Springs Valley, California has emphasized the compositional influence of salt storage mechanisms in sediments over simple or cyclic hydrographic variation of saline waters, and has elucidated the effects of precipitate geochemistry on brine composition. Delineation of trends in inflow chemistry has indicated the interrelation but basic dominance, or lithologic over climatic controls. Details of these findings are being examined further in other basins. Problems of methodology in solution analysis over an extremely wide range of conditions, and in better definition of associated solids, have received much attention, and work to further refine techniques in this progress.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1096, NUMERICAL SIMULATION OF HYDRODYNAMIC PHENOMENA BY DIGITAL COMPUTER

C. LAI, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

Purpose: To develop numerical methods for solving selected surface and ground water fluid dynamics problems; to develop new computer simulation techniques with which to model natural field phenomena.

Methods: Movements of wave-crest in open channels will be simulated, pictorial representations of surface profiles of wave-crest movements will be developed and results will be compared with field observations.

Free-surface, unsteady, gravity flow through porous media induced by transient open-channel flows will be simulated by digital models.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1097, THE POST-PLEISTOCENE EPICYCLE SEQUENCE OF ALLUVIATION AND EROSION IN THE LOWER SAN JUAN DRAINAGE

D. OBRYAN, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

Non-nuclear techniques such as sedimentation, geomorphology, palynology, dendrochronology, archaeology, and history are being applied in a study of late Recent sequences of alluviation, arroyo cutting, and terracing along parts of Chinle Wash in northeastern Arizona. These sequences will be related to the effects of environmental and hydrogeologic controls in an effort to reconstruct the local paleoenvironment, and to aid in the reconstruction of paleoenvironments in other semi-arid parts of the world.

The alluvium consists mainly of two deposits; the older was deposited between 2,000 B. C. (?) and A. D. 1100-1200, and the younger accumulated between A. D. 1300 and 1850, when the

present arroyos began to form. Remains of prehistoric Pueblo Indian culture occur in the upper part of the older alluvium. Sites representative of Basketmaker III and Pueblo I (8th to 10th centuries) occur as much as 25 feet below the top of the older alluvium. Pueblo II and III (11th to 13th centuries) remains either are buried in the upper few feet of the older alluvium or occur on the terraced surface cut from that unit.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1098, PERIODIC PLANT GROWTH PHENOMENA AND HYDROLOGY

R.L. PHIPPS, U.S. Dept. of Interior, Geological Survey, Arlington, Virginia

Most plant growth phenomena (sprouting, height and diameter growth, leafing, flowering, fruiting, etc.) may be regarded as integrated responses to present and past environments within hereditary limits. Though relationships between these growth activity phenomena and hydrologic components of environment are incompletely understood, data relative to such an understanding may be easily collected for a wide number of plant species over a large area by 1) noting dates of occurrence of various plant-growth phenomena and relating them to precipitation and stream-flow and, where practicable, to soil moisture and ground-water fluctuations; 2) mapping of vegetation and making observations concerning related microclimatic variation to facilitate interpretation of periodicity of plant activity; and 3) making measurements of rates of current three-dimensional growth of trees for inclusion with, and analysis of, tree-ring data and growth form. These data are potentially of value as a means of further definition of cycles of hydrologic activity in vegetated areas, of estimating trends and variability in hydrologic phenomena, and of extending hydrologic records in space and time.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1099, THERMAL CHARACTERISTICS OF AQUIFER SYSTEMS

R. SCHNEIDER, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

Background: One of the most difficult problems in defining the flow pattern in aquifer systems is the determination of vertical permeability of aquifers and their confining strata. Under natural conditions or when induced by pumping, there can be a significant quantity of cross-formational flow. In general our ability to predict the effects of the large-scale development of aquifers is directly related to the precision with which we can estimate the spatial distribution of permeability. The study of the relation between thermal and hydrologic characteristics of various types of aquifers would improve our capability for defining permeability in a vertical direction.

Objectives: To study the temperature distribution in representative coastal-plain aquifers and carbonate-rock aquifers, in which hydrologic conditions are well known and relatively simple and relate this parameter to vertical permeability and other flow characteristics of the aquifer system.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1100, BASIC RESEARCH IN VEGETATION AND HYDROLOGY

R.S. SIGAFOOS, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

The objective is to determine qualitative and quantitative differences in vegetation which are related to flooding and low flow of streams, to differences in quantity of surface and ground water, and to recent activity of mountain glaciers.

Plants are identified and mapped and trees are measured in the field; the distribution of them is related to type of surficial material and bedrock, to height above low water, to height of floods of different frequency, to topographic features, to estimated depth to water table, and to land use. Where appropriate, cores and sections of trees are taken, and ages of trunks are determined. In the office, significance of association or independence of the variables is tested statistically, and mathematical methods of expressing vegetation differences are determined.

2. WATER CYCLE

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1101, GRAIN SIZE DISTRIBUTION AND BEDLOAD TRANSPORT

G.P. WILLIAMS, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

Flume experiments will be carried out relating bedload transport rate to channel factors, and especially variations resulting from changes in size distribution keeping median grain size constant. Bed forms, including values of linear grain concentration, will be measured.

The basin hydraulic parameters of the upper limit of flow of G. X. Gilbert experiments will be duplicated and runs will extend these data to larger values of discharge and grain size.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1102, TRANSPORT PROPERTIES OF NATURAL CLAYS

R.G. WOLFF, U.S. Dept. of Interior, Water Resources Division, Arlington, Virginia

The work includes (a) Assessing the applicability of existing sampling and measuring techniques for determining the hydraulic properties of undisturbed clay samples. Modifying the techniques as necessary. (b) Developing in stages, the equipment and techniques for measuring all the transport properties that govern the movements of water and dissolved solids through undisturbed clay samples. (c) Introducing the use of these measurements to field problems and, using the data obtained, attempting to correlate the transport properties of natural clays with their mineralogical, chemical, and geological characteristics.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1103, EFFECTS OF ZOOPLANKTON ON PHOTOSYNTHESIS BY ALGAE IN LAKES

J.W. BISHOP, Virginia Polytechnic Institute, Water Resources Research Ctr., Blacksburg, Virginia 24061

Field studies will be conducted to ascertain the effects of vertically migrating zooplankton on rates of photosynthesis by natural assemblages of phytoplankton. Phytoplankton will be isolated from or exposed to zooplankton. The quantities of phytoplankton and their rates of photosynthesis then will be measured. Differences between the two groups of phytoplankton will be attributed to effects of zooplankton. The combined as well as individual effects of different species of zooplankton will be estimated.

University of Richmond

2.1104, SOIL AND WATER MANAGEMENT AS RELATED TO FORAGE CROP PRODUCTION

R.H. BROWN, Virginia Polytechnic Institute, Agricultural Experiment Sta., Blacksburg, Virginia 24061

Objective: To study the establishment and maintenance of forage species and mixtures as influenced by: (1) liming and fertilization, (2) irrigation and drainage, (3) tillage, and (4) fumigation.

These are all small plot investigations conducted in various locations at research stations in Virginia. Data are being obtained on species balance, yield, and the chemical composition of individual species in the plant associations. Present experiments include nitrogen fertilization and the interaction of nitrogen fertilization with potassium on grass-legume mixtures; grasses grown alone and with legumes with different cutting managements; nitrogen fertilization, responses of grasses to 3 levels of nitrogen and 4 of K₂O; and one experiment is set up to study the interrelationship of irrigation, cutting management, nitrogen fertilization of orchardgrass.

SUPPORTED BY Virginia State Government

2.1105, INVASION OF THE AQUATIC HABITAT BY AMPHIBIOUS SPECIES OF POLYGONUM

R.S. MITCHELL, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

The purpose of this project is to determine the aquatic capabilities of so-called 'semi-aquatic' species of Polygonum of the section Persicaria. Through cloning experiments the properties of these organisms may be compared with those of P. amphibium, the only true aquatic of the group, and a scale of amphibiousness may be drawn up with regard to the species studied.

Through such endeavors, coupled with cytological, anatomical and biosystematic comparisons, it is hoped that a clearer understanding of the relationships between species of Polygonum may be reached, and that putative parents for P. amphibium might be assigned. This study affords an excellent opportunity for comparison of terrestrial and aquatic species in a closely related group.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch

2.1106, CHARACTERIZATION OF THE PHYSICAL PROPERTIES OF THE SOILS OF VIRGINIA

J.E. MOODY, Virginia Polytechnic Institute, Agricultural Experiment Sta., Blacksburg, Virginia 24061

OBJECTIVES: (1) To study the physical properties of various soil series of the state and obtain data on the ranges in these properties. (2) to correlate the physical data with field characteristics to provide supporting data to local health directors and other agencies in evaluation of land for sewage disposal and other urban uses. (3) to study the physical properties and their relation to the genesis and morphology of the various soils.

DESCRIPTION OF WORK: This study of soil physical properties will be in the following areas: (1) Permeability measurements of important soil types of Virginia to include in place measurements of restricting layers and laboratory measurement of hydraulic conductivity. (2) Interrelationships of soil characteristics and the seasonal march of the water table in various Virginia soils to include important soils in the Coastal Plains and Piedmont regions. (3) Extent and nature of the shrink-swell properties of Virginia soils, and (4) soil moisture characteristics and related physical properties of the soils of Virginia.

SUPPORTED BY Virginia State Government

2.1107, PHYSICAL PROPERTIES OF IMPORTANT SOIL TYPES OF VIRGINIA AS THEY RELATE TO WATER AND AIR BEHAVIOR AND TILLAGE

J.D. PENDLETON, Virginia Polytechnic Institute, Agricultural Experiment Sta., Blacksburg, Virginia 24061

Objectives - 1. To measure the capacity for water intake, storage, and for supplying water to crops of some important soil types. 2. To determine the bulk density of these soil types. 3. To determine these properties for each horizon of the profile of the soil type. 4. To study the depth of a soil type that is effective for water storage and root development. 5. To relate these properties to the productivity of these soil types for crops and to land and earth use for roads, buildings, and other purposes.

To accomplish these objectives the soil types are sampled horizon by horizon using a special core sampler fitted with cylinders to hold cores of definite size. The structure of the soil is not disturbed. These cores are placed on a porous plate in a pressure chamber or on a cellophane membrane in a pressure membrane extractor; the desired pressure is applied and at equilibrium the moisture percentage of the soil is determined. The bulk density is found for other cores of the same horizons. This makes it possible to find how much water for crop use the soil types hold.

SUPPORTED BY Virginia State Government

2.1108, GROUND WATER RESERVOIR RESPONSE TO EARTH TIDES

E.S. ROBINSON, Virginia Polytechnic Institute, Graduate School, Blacksburg, Virginia 24061

The proposed research is concerned with the application of measured tidal water level fluctuations in wells for determining aquifer porosity and specific storage. The research involves measurements of well water level fluctuations for 2-3 month periods, computation of the tidal dilatation of the solid earth, and recording of supplementary barometric and seismic data. The project

2. WATER CYCLE

work will attempt to verify recently published theoretical treatments of aquifer response to earth tides.

Field investigations include: a) Well water level recording; b) Tidal gravity recording; c) Borehole temperature logging; d) Seismic refraction surveys; e) Barometric pressure recording at well-sites.

Data analysis and interpretation involve: a) Resolution of principal tidal components by harmonic analysis; b) Computation of solid earth tidal parameters for realistic models; c) Calculation of porosity and specific storage for aquifers characterized by fracture systems, and estimation of volume of large water filled caverns.

From these data and calculations the applicability of tidal parameters to the determination of aquifer characteristics will be evaluated.

2.1110, SOLAR REFLECTANCE OF MONOLAYER-COVERED WATER SURFACES AS RELATED TO EVAPORATION SUPPRESSION

J.T. BEARD, Univ. of Virginia, School of Engineering, Charlottesville, Virginia 22903

The importance of evaporation suppression in conserving water has been noted by many investigators. Most of the evaporation suppression work has been centered around the fact that monolayers of certain hydrocarbons placed on the surface of water act as a barrier which water molecules must penetrate in order to evaporate.

The idea of evaporation suppression by increased solar reflectance has been presented by Beard. An analytical investigation showed that a chemical monolayer or thin film with suitable optical properties (index of refraction and extinction coefficient) could substantially increase the reflectance. Thus the rate of evaporation is reduced due to the decrease in solar energy absorbed by the water.

It is proposed that research be done to determine the chemical substances which will substantially increase the solar reflectance of lake surfaces. As the known values for optical properties are limited to substances in the bulk form rather than a monolayer form, experimental work is necessary.

2.1112, BIOLOGICAL AND CHEMICAL STUDY OF VIRGINIAS ESTUARIES

M.L. BREHMER, Virginia Inst. of Marine Sci., Gloucester, Virginia

Virginia's three major estuarine systems--the James, the York, and the Rappahannock--exhibit different biological characteristics both within and between years. These differences have been noted in phytoplankton populations; in shellfish reproduction, growth, and condition; and in finfish populations.

This study will compare the biological, chemical, and physical characteristics of the three systems. Stations will be occupied at 5% intervals from 25 to less than 0.5% in each river at slack before flood tide. Water samples will be collected at 2 m intervals from surface to bottom and the water column described by temperature, salinity, dissolved oxygen, pH, alkalinity, chlorophyll, suspended solids (loss on ignition and fixed residue), transparency, phosphorus (soluble reactive, soluble unreactive, particulate reactive, and particulate unreactive), and nitrogen (soluble organic, ammonia, nitrite, nitrate, and particulate organic). Primary productivity levels will be determined.

Nutrient levels and turn-over rates, phytoplankton standing crop and productivity, and the dependent and independent physical and chemical characteristics of the three systems will be compared. Data collected by the shellfish and finfish departments at the Institute will be utilized to complete the analyses.

2.1114, FACTORS AFFECTING THE MOVEMENTS OF WATER AND ORGANISMS WITHIN A REGULATED MULTIPURPOSE LAKE

G.F. KRAFT, Western Washington State Coll., Graduate School, Bellingham, Washington 98225

A four year backlog of limnological information on Lake Whatcom, Washington (5,000 acres; 750,000 acre-feet) has been collected and an intensive three year study is proposed. Recording meteorologic instruments are to be placed at lake level and used together with current, wave, and seiche measuring instrumentation to quantify the relationships between wind and water movement. Total heat, water, and geochemical budgets will be determined. The sources and fates of the several polluting agents (silt, enterococcus and coliform bacteria) will be determined. The pollutability of the lake will be measured, in terms of the survival times of the bacterial agents present under the conditions of water circulation and other limnological conditions which obtain. The project is designed as one which will give limnological base information necessary for the manipulation of multipurpose water resources.

SUPPORTED BY U.S. Dept. of Hlth. Ed. & Wel. - P.H.S.

2.1116, SOIL AND WATER RELATIONSHIPS OF VEGETABLE CROPS

P.C. CRANDALL, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

1. To determine the water requirement of the principal vegetable crops in western Washington. 2. To evaluate methods for measuring temporary moisture stress in plants. 3. To increase the concentration of bloom and harvest of bush beans. 4. To determine the interrelationship of cultural practices and varieties as they relate to crop efficiency.

Water column supported lysimeters will be used to measure water requirements and correlate water use with evaporation from standard 4-foot evaporation pans. Mist applications will be evaluated on bush beans for blossom drop control and their effect on yields. Soil and leaf temperatures will be measured. Chemical sprays will be tested for their effect on blossom concentration. Refractometer measurements, diurnal volumetric fluctuations, and thermocouple psychrometers will be compared for their value in determining temporary moisture stress. The interrelationship of fertilizers, cultural practices, and varieties will be determined for vegetable crops common to western Washington.

SUPPORTED BY Washington State Government

2.1117, PHYSICAL CHARACTERISTICS OF BASALT AQUIFERS

J.W. CROSBY, Washington State University, School of Engineering, Pullman, Washington 99163

The proposed research is directed toward a detailed study of the basaltic aquifers in the Pullman, Washington area. By utilizing composite geophysical well logging methods, the investigators will evaluate the diminutive features which apparently play such an important role in basalt hydraulics. Utilizing combinations of gamma, spontaneous potential, single point resistivity, short normal resistivity, long normal resistivity, caliper, and neutron logs the following features will be examined in area wells: 1. Lateral continuity of water-bearing zones. 2. Lateral variations in porosity. 3. Bulk porosity of basalt sequences as opposed to horizontal porosities and individual layer porosities. 4. Lateral continuity of basalt flows and techniques for their correlation. 5. Possible relationships between radiation logs and specific capacities of wells. 6. Structural conditions in the basalts which may influence ground-water motion. 7. Relative importance of interflow zones, joints, weathered horizons, buried channels, faults, etc. in ground-water movement. 8. Vertical distribution of aquifers.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Washington State University

2.1118, ORCHARD MANAGEMENT

E.S. DEGMAN, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

1) To determine the value of controlling weeds around young trees. 2) To find the most profitable way of filler tree removal. 3) To find a suitable way for a grower to determine when to irrigate. 4) To study methods of pruning, especially pertaining to dwarf trees.

This project covers all the aspects of orchard management. Chemical control of weeds is no better than mechanical control around young trees, but it is less expensive and is more likely to be done correctly. Filler tree removal studies show that it pays a grower to cut his filler trees back and leave them in a little longer (4 years). Many growers irrigate by the calendar, a questionable practice. We are trying to tie evaporation into the program. We feel that mechanical pruning will be an orchard management

practice of the future and are growing trees with that, specifically, in mind.

SUPPORTED BY Washington State Government

2.1119, PREDICTION OF WATER MOVEMENT IN UNSATURATED SOILS

W.H. GARDNER, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

Regional Obj. hysteresis and to define its role in the movement of water, solutes and energy in soil.

Regional Obj. 3. To delineate the influence of structural and electrostatic differences as well as solute concentration and energy gradients upon the movement of solutes, energy, and water soils.

Soil columns will be sealed in containers with soil initially at uniform water content. Temperature gradients will be established by means of heat and cold reservoirs placed at the column ends. Water content distribution will be followed as equilibrium is established and then the temperature gradient reversed. Hysteresis studies will be based on flow of water and the different equilibrium water content conditions reached on temperature reversal. Water content will be inferred from neutron attenuation measurements.

Soil columns will be set up so that they can shrink or swell in a single dimension at right angles to the direction of water flow. Water will be supplied at one end for study of wetting conditions or dried down from one end for study of drying conditions. Water content will be inferred from neutron attenuation measurements and bulk density changes from gamma ray attenuation measurements in association with the neutron water content measurements.

2.1120, RUNOFF GENERATION AS A FUNCTION OF PRECIPITATION AND WATERSHED CHARACTERISTICS

J.S. GLADWELL, Washington State University, State Water Research Center, Pullman, Washington 99163

A study of the physical and climatological parameters of Western Washington watersheds is to be made in order to define quantitatively their effect on the transformation of effective precipitation into runoff. Through the use of these 'coefficients' it is planned to study the possibility of generating synthetic hydrographs in areas with no runoff gages, and extensions of current gage histories through the use of precipitation information. It is hoped also to explain variations in probability distribution between watersheds relatively close together.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch Washington State University

2.1121, THE STORAGE COEFFICIENT AS A FUNCTION OF WATER TABLE CELERITY

D.T. HIGGINS, Washington State University, School of Engineering, Pullman, Washington 99163

The application of unsteady, unconfined groundwater flow equations based on the Dupuit assumptions and a constant coefficient of storage yields unsatisfactory results for thick aquifers at early time. Contemporary efforts to improve these equations appear to be concentrating on the inclusion of vertical flow effects in the equations. However, the correlation of field and laboratory data with the newer theory is still weak. The problem may lie in the oversimplified treatment of the storage coefficient.

The release of stored water as the water table drops is thought to be a time dependent gravity drainage phenomenon. Actually, the rate of release of stored water is a function of the water table celerity and reflects all the complexities of unsaturated flow.

It is proposed to first study in the laboratory the functional dependence of the storage release on the water table celerity. Then, using the experimental results as a guide, the extremely complex problem of unsaturated flow with a time dependent boundary condition may be simplified in order to derive a usable expression for the drainage celerity function.

2.1123, WHEN TO IRRIGATE M.C. JENSEN, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

When to irrigate seeks to establish the amount of water that can be used from the soil moisture reservoir between irrigations and obtain optimum production from selected irrigated crops. The crop to be studied in 1962 is potatoes. Five irrigation treatments based on irrigating each day and when 30%, 45%, 60%, and 75% of the available water has been removed from the effective root zone and two irrigation methods (sprinkling and furrow) will be included. Three replications in 40' x 40' random plots will be part of the experimental design.

Two crops will be studied each following year, procedure being modified according to the 1962 experience.

2.1124, NUTRIENT INPUT TO WASHINGTON SOILS FROM ATMOSPHERIC SOURCES.

C.D. MOODIE, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

OBJECTIVES: 1. To determine the quantities of nutrients contributed to soil and crops in Washington by rainfall and irrigation waters. 2. To estimate the quantities of nutrients which may be absorbed directly in gaseous form from the atmosphere by plants and soils.

WORK PROPOSED: A precipitation network of 10 to 15 stations will be established to cover rainfall conditions around the state; one is established on each experiment station and adjacent to standard weather stations. Stream and well waters from areas where nutrient input from irrigation waters appears to be critical will be sampled. The rainwater and irrigation samples will be analysed for Ca, Mg, Na, K, NH₄-N, Cl, SO₄, HCO₃, and NO₃ routinely. Certain minor elements will be determined on selected samples.

A comprehensive review of published data on water quality will be undertaken if funds are available. Two objectives are sought: (1) an appraisal of the suitability of each water for irrigation purposes and (2) an estimate of its value as a source of nutrients.

Estimates of nutrients in gaseous form in the atmosphere are to be made: Detailed procedures for this phase remain to be worked out.

2.1125, THE EFFECTS OF IRRIGATION AND FERTILIZATION UPON A PONDEROSA PINE FOREST STAND M.M. MOSHER, Washington State University, Agricultural Experiment Sta., Pullman, Washington 99163

OBJECTIVES: To determine the effects of irrigation and fertilization upon the vegetative and reproductive growth and upon wood quality and to determine what environmental changes may occur with increased water supply.

DESCRIPTION: A 60-year old pure stand of ponderosa pine located in Stevens County, northeastern Washington, will be fertilized with nitrogen, irrigated, and both fertilized and irrigated. The effect of these treatments upon diameter and volume growth, on seed production and on secondary vegetation will be compared to natural conditions by yearly measurements and observations.

2.1127, PLANKTON-PERIPHYTON STUDIES IN THE COLUMBIA RIVER

C.E. CUSHING, Battelle Memorial Institute, Richland, Washington 99352

Autotrophic organisms assimilate inorganic nutrients directly from the water, thus occupying a basic position in aquatic food-webs. In this context, they play an important role in the cycling of radioisotopes to higher trophic levels and, in the case of phytoplankton, in the dispersal of radioactivity. Current studies are in progress to further elucidate these functions.

Data on the transport of ³²P and ⁶⁵Zn by net plankton are currently being evaluated. Preliminary calculations reveal that as much as 1.8 Ci of ⁶⁵Zn and 1.2 Ci of ³²P per day are transported downstream from Hanford. Highest concentrations per unit weight are found during the winter months. This study is being expanded to include the role of the nanoplankton in the transport of radionuclides.

Periphyton, especially in smaller, rapidly flowing streams, comprises the main source of primary production in these habitats. Studies are in progress to evaluate the relationships between primary productivity, environmental parameters, and radionuclide uptake and cycling of this community. Data presently being analyzed reveal good correlations between dry weight, ash weight, and chlorophyll a content. Net Production Rate was closely related to chlorophyll a content and solar energy. Phosphorus-32 and ⁶⁵Zn accumulation were best related to dry and ash weight and chlorophyll a, but poorly related to the river burden index of these isotopes. This anomaly is being investigated further under controlled conditions. Work is now being initiated to study the cycling of radionuclides and the effects of varying environmental parameters on this phenomenon using a specially designed algal growth chamber in conjunction with an in situ radiation detector.

2.1129, COLUMBIA RIVER CHINOOK SALMON

D.G. WATSON, Battelle Memorial Institute, Richland, Washington 99352

The section of the Columbia River within and immediately adjacent to the Hanford Reservation is the only remaining portion of the Columbia River in which chinook salmon spawn. Changes in the river environment, produced by the construction of hydroelectric dams, have destroyed other main stem salmon spawning habitats.

Population estimates of locally spawning salmon have been made since 1947 by aerial surveys of the spawning grounds. Results of these surveys are compared with those of previous years and with the escapement of salmon to the Columbia River in general, as determined by counts of adult salmon ascending downstream dams.

Comparison of the first (1947-1951) to the last (1960-1964) five year periods of this study shows an approximate threefold increase in the local population while the number of fish ascending Bonneville Dam was reduced by half. Part of this apparent success of the local race of fish is presumed to be due to the barrier effect from Priest Rapids dam, located just upstream from the Hanford Reservation. During the 12 years prior to the construction of this dam an average of 17% of the total number of salmon nests were observed in the area immediately downstream from this dam, since then a mean of 43% of the total were in this area. The mean annual number of salmon nests during 17 years is 600, with a range of 64 to 1485. There is no evidence that the Hanford Operation has affected the local salmon population.

SUPPORTED BY U.S. Atomic Energy Commission

2.1130, TRANSLOCATION OF RADIONUCLIDES BY FISH

D.G. WATSON, Battelle Memorial Institute, Richland, Washington 99352

The migration of resident species of Columbia River fish upstream from or into tributaries below the section of the river receiving radioactive effluents provides a route of dispersion of radionuclides in a natural ecosystem. The objects of this study are: 1) determine the season and extent of migration of the various fish species; 2) estimate the amounts and kinds of radioelements translocated by these populations; 3) provide estimates of size of some of the major fish populations.

Results to date show that seasonally as much as 80% of the fish collected upstream from reactor effluent outfalls, and in a stream tributary to the Columbia River downstream from Hanford, have been exposed to radioactive effluents.

Future work will employ an electric fish shocker, as well as nets, for the collection of fish. A portable radiation counter will be used to sub-sample the catch, and specimens not selected for tissue analysis will be marked by a thermal brand and released into the river. The marked individuals will provide the basis for population estimates and rate of movement when they are recaptured. It is anticipated that change in the ratios of the amounts of two biologically important radioisotopes, ^{65}Zn and ^{32}P , in the fish will also give information on rate of movement.

This project is coordinated with a study on the fish disease, *C. columnaris*, and may provide information on the role fish migration plays in the spreading of this disease.

2.1131, EFFECTS OF INDUSTRIAL EXPANSION ON THE AQUATIC ENVIRONMENT OF ESTUARINE AREAS

G.R. SNYDER, U.S. Dept. of Interior, Biological Laboratory, Seattle, Washington 98102

The Lower Columbia River and its estuary plays a critical role in the life cycle of anadromous salmonids. Each year millions of young fish move downstream from native rearing areas and artificial propagation facilities. These fish all pass through the lower

river and estuary where they undergo physiological transformations in preparation for their movement from fresh to salt water. The estuary also is an important nursery area and the transition zone for marine species of fish.

Industrial expansion in this area by the thermal electric power, aluminum, and pulp and paper industries can drastically modify the environment. Forecasts indicate that over 2000 MW. of electricity (possibly 4000MW.) could be produced in the Columbia estuary by 1985. The effects of waste heat discharged from these plants could be detrimental to the overall aquatic ecology and specifically to the production of commercial species of fish. Limnological studies are planned to determine the existing ecology at sites known to have potential for industrial expansion. The effects of increases in water temperature on aquatic organisms at specific sites will be studied. Predictions of physical and biological changes will be made. The effects of the environmental changes on fish and on secondary organisms necessary for their survival and growth will receive initial emphasis.

2.1132, A STUDY OF SERIAL CORRELATION IN ANNUAL STREAM RUNOFF

T.H. CAMPBELL, Univ. of Washington, School of Engineering, Seattle, Washington 98122

This research has two primary objectives: (1) To improve existing stochastic models of annual stream runoff by including the variability of the serial correlation coefficient, and to apply the resulting model to methods of studying the probabilities of periods of drought or of excessive runoff, and (2) To relate the serial correlation coefficient to physical watershed parameters.

Streams with sufficiently long historic records will be analyzed for variability of the serial correlation coefficient, which reflects the carryover effect from a relatively wet or dry year into the following year. Methods for determining this variability will be evaluated. Methods for studying periods of drought (or of water excess) will be developed.

Streams in a specific region will be studied to attempt to find a useful relation between the serial correlation coefficients and any gross physical characteristics of the drainage basins.

2.1133, FAUNAL AND TROPHIC STUDIES OF AN INTERTIDAL COMMUNITY

R.T. PAINE, Univ. of Washington, Graduate School, Seattle, Washington 98122

This is a continued study of the ecology of marine rocky intertidal communities. Since 1963, an intensive effort has been made to unite knowledge of the natural history, population bioenergetics, and inter-population interactions into a general scheme of community organization for Mukkaw Bay on the outer coast of Washington State. The current proposal seeks both to continue these studies locally and to extend them to analogous southern hemisphere communities in New Zealand. Similar techniques of individual marking and community manipulation (exclusion, addition, and transplantation) will be followed. The major goal of the work will be an investigation of the degree to which the causal processes (especially predation) known to be important in species distribution and abundance in one community can be generalized to other similar ones.

2.1134, LOW-FLOW ANALYSIS, WASHINGTON STREAMS

F.T. HIDAKA, U.S. Dept. of Interior, Water Resources Division, Tacoma, Washington

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Washington.

Purpose - To derive methods of using gaging station records for projection of low-flow characteristics to miscellaneous discharge measurement sites.

2. WATER CYCLE

Methods - Gaging station records will be analyzed for low-flow frequency, flow duration, base flow, and duration hydrograph. Correlation techniques will be used to extend short-term records and miscellaneous discharge measurements to long-term experience. Parameters such as a variability index based on the flow duration curve or baseflow curve will be investigated.

2.1135, GROUND-WATER HYDROLOGY AND DEVELOPMENT IN EAST-CENTRAL WASHINGTON

J.E. LUZIER, U.S. Dept. of Interior, Water Resources Division, Tacoma, Washington

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Washington.

Purpose: To determine the hydrologic character of the regional ground-water reservoir and predict its probable response to development.

Method: An inventory of all large-capacity (deeper) wells and a representative group of low-capacity (shallower) wells will be obtained. An extensive network of observation wells will be established and data collected for two years to determine the response of ground-water levels to withdrawals. Intensive collection of data in selected areas will allow preparation of maps showing water level elevations and allow computation of an 'area' storage coefficient. The disposition of withdrawals will be studied to appraise return flow and consumptive use in a 'type' area.

2.1137, HYDROLOGY AND GEOCHEMISTRY OF CLOSED BASIN LAKES

A.S. VANDENBURGH, U.S. Dept. of Interior, Water Resources Division, Tacoma, Washington

A study of the hydrologic and hydrochemical characteristics of a closed lake and its surrounding basin can furnish information on the mechanisms of salt migration and accumulation, the means of salt storage and the stability of the stored salt, and the manner in which a closed-lake system reacts to and records the changes in climate and the activities of man. Abert and Summer lakes with their respective tributary basins provide adjacent environments of hydrologically divergent character ideally suited to an investigation of the various aspects of salt economy. The hydrologic character of Abert Lake is highly sensitive to even slight climatic fluctuation, while at Summer Lake under natural conditions the seasonal and year-to-year uniformity of spring flow has masked all but the extremes of climatic change.

The objectives of this project are to evaluate quantitatively and qualitatively the incoming, outgoing, and stored solutes at the two lakes; to study the effect of climatic changes on the amount and character of solutes within the three realms; and to compare and relate present hydrochemical conditions to those estimated for the pluvial period when a single lake occupied both basins.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

2.1138, RUNOFF STUDIES ON SMALL WATERSHEDS

J.C. BURCHINAL, West Va. University, School of Engineering, Morgantown, West Virginia 26506

a. To evaluate the factors affecting the peak discharge of storm runoff. b. To evaluate the factors affecting the volume of storm surface runoff. c. To study the basic factors affecting the hydrograph of surface and ground water flow from soil-cover conditions.

2.1139, GEOCHEMICAL BEHAVIOR OF IRON AND MANGANESE IN A RESERVOIR (LAKE LYNN, WEST VIRGINIA) FED BY STREAMS CONTAINING ACID MINE DRAINAGE

R.G. CORBETT, West Va. University, Graduate School, Morgantown, West Virginia 26506

Total Program - We proposed to study the geochemical behavior of iron and manganese in a dynamic system involving the impoundment of waters polluted by acid mine drainage. The natural model chosen is Lake Lynn, West Virginia, which has formed behind a dam constructed in 1929. The quality of water and abundance of fauna in the reservoir have deteriorated according to available data. An understanding of the behavior of iron and manganese in this environment should benefit many workers in water resources. The phases of research are ordered such that the project may progress as long as results appear fruitful.

Phase I - Areal Variation in Iron and Manganese Content of Sediments of Lake Lynn. From 150-200 samples of sediment from lake Lynn will be collected and analysed mechanically for particle size and spectrochemically for iron content and manganese content. Any variations present will suggest the course of future phases. Concurrently, the literature will be reviewed for information pertinent to the entire study.

Subsequent researches may involve mineral species in the sediments chemical stratification and seasonal variation thereof of iron and manganese in the impounded water and pore water of the sediment, co-precipitation of other elements with iron and manganese, and a chemical budget involving influx, precipitation, and escape at the reservoir outlet of iron and manganese.

2.1140, INFLUENCE OF TOPOGRAPHIC FEATURES ON RAINFALL IN WEST VIRGINIA

W.H. DICKERSON, West Va. University, School of Agriculture, Morgantown, West Virginia 26506

Rainfall patterns over the State will be examined in the light of topographic influences (such as, for example, elevation, exposure, rise). Various parameters which are believed to be of importance in determining the rainfall patterns will be selected and a numerical value assigned to each. The parameters will be used in a computer program for deriving multiple regression equations and testing the significance of the terms. In this manner, the original parameters will be eliminated to those which prove to have significance in establishing rainfall patterns. The end result will be an equation or equations that will estimate the rainfall amounts or rates for any locality, based on topographic conditions at the site. Such estimates will provide the basis for the construction of improved isohyetal maps, the isolines of which are now poorly defined for rather extensive areas of the State as a result of the absence of long time observations on precipitation. These procedures can be expected to be of the most significance for determining rainfall conditions in the more mountainous and inaccessible areas which are largely occupied by forests.

West Virginia University

2.1142, AGRICULTURAL CLIMATOLOGY OF WEST VIRGINIA W.H. DICKERSON, West Va. University, Agricultural Experiment Sta., Morgantown, West Virginia 26506

1. To develop methods of analyses and utilization of climatological data of the Northeast, 2. to determine by phenological techniques the response of selected plant species to changes in climatic variables, and 3. to ascertain the influence of climatic variables on the growth and development of economically important plant species.

The work in West Virginia will be primarily concerned with statistical studies of the historical weather data, also with working toward the establishment of a network of agricultural weather stations and with efforts to develop new methods of estimating the climate of farms or orchards from data of nearby weather stations. Phenological studies using the Persian lilac will be established. Exploration of the interrelationships of such variables as insolation, temperature in soil, air, and plants, as well as studies of the dynamics of frosts will be undertaken.

SUPPORTED BY U.S. Dept. of Agriculture
West Virginia State Government

2.1143, LABORATORY AND FIELD STUDIES OF FROST HEAVING C.F. ENGLE, West Va. University, Agricultural Experiment Sta., Morgantown, West Virginia 26506

To relate the physical and mineralogical properties of soils to the extent and severity of heaving; study the relationship between fertility and management practices and the extent of heaving damage to alfalfa; study ice lens formation as affected by physical properties and moisture content of soils.

Measurements of freezing depth, moisture content in and below frozen soil and temperature will be taken in the field on two soils. The data will be related to theoretical equations found in the literature for predicting depth of frost penetration. The relationship between management and fertility practices to alfalfa heaving will be studied statistically. Management practices will consist of three cuttings of alfalfa by September 1 plus the following: no further harvest; harvest October 15; cut on October 15 and clippings left on as mulch. Fertility practices will consist of minimum maintenance surface fertilization in conjunction with deep fertilization with LPK in various combinations. Measurements will be taken on stand, rooting depth and habit, yield, and amount of heaving. Ice lens formation will be studied in a cold room. Major emphasis will be placed on the relationship between soil density and soil layer arrangement on the rate of water movement to the freezing zone and to critical soil moisture contents for maximum soil heaving.

2.1144, MILWAUKEE RIVER WATERSHED LAKE VEGETATION SURVEY S.J. KLEINERT, State Dept. of Nat. Resources, Madison, Wisconsin 53701

An aquatic plant survey was conducted between June 10 and August 30 on the lakes within the Milwaukee River watershed. This was both a quantitative and qualitative study of the present plant communities. Attention was given to the distribution patterns, abundance, and the effect man's activity may play in altering these communities. This survey was also intended to establish a record for future studies. The objectives were determined from data obtained by random sampling of the plant communities within each lake. With the aid of aerial photographs and contour maps the vegetation areas were located and recorded. Twenty-three lakes and several Milwaukee River backwater areas were surveyed. Nine of the lakes were resurveyed, at the end of August, to determine changes in dominance and abundance.

SUPPORTED BY Wisconsin State Government

2.1145, AN ANALYSIS OF WETLANDS VALUES S.J. KLEINERT, State Dept. of Nat. Resources, Madison, Wisconsin 53701

To review and summarize existing information on wetlands and to evaluate their present and potential importance to man from a broad ecological standpoint. As one facet of the evaluation, a determination will be made of wetlands value in terms of dollars and other quantitative units. Intrinsic values of wetlands, such as scenic beauty and scientific utility will be reviewed, as will the work they may perform such as storing water and contributing to ground water recharge. Hazards to occupancy and development also will be reviewed in terms of replacement value, that is, cost of duplicating the facilities of the developed wetland at a future time.

2.1146, WATER RESOURCES OF CENTRAL WISCONSIN, A WATER-POOR AREA E.A. BELL, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with the State of Wisconsin.

Purpose: To determine the distribution and character of glacial deposits in buried bedrock valleys in the area and make a preliminary appraisal of the potential of artificial recharge to increase water availability in heavily pumped areas.

Methods: Available test drilling results and well log will be assembled and used to plan refraction, seismic, and test drilling programs to delineate buried bedrock valleys which contain saturated sand and gravel deposits. Water samples will be analyzed. Observation wells will be installed to determine water-level variations in areas presently unaffected by pumping. Aquifer tests may be performed using municipal wells tapping the sand and gravel aquifer.

2.1148, HYDROLOGIC EFFECTS OF SMALL RESERVOIR ON NEDERLO CREEK, WISCONSIN

J.H. GREEN, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

Purpose - To provide hydrologic data necessary to answer questions regarding the effect of small reservoirs on streams in southwestern Wisconsin.

Methods - Ground-water divides and overland runoff divides will be located for the hydrologic basin that contributes water to Nederlo Creek. The hydrologic system will be defined by collecting data on precipitation, temperature, soil moisture, ground-water levels, aquifer characteristics, spring flow, streamflow and stage, water quality and temperature, reservoir stage and suspended sediment. Seepage runs on the stream, altitude surveys, and ground-water flow network studies will be made. All phases of the hydrologic cycle except evapotranspiration will be measured. Evapotranspiration in the basin will be estimated.

2.1151, WATER RESOURCES OF SOUTHEASTERN WISCONSIN - RACINE AND KENOSHA COUNTIES

R.D. HUTCHINSON, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

This research is part of the program of water resources investigation conducted by the U. S. Geological Survey in cooperation with the State of Wisconsin.

Purpose - To determine the quantity and quality of the ground water resources available for the expanding population and increasing industrialization in southeastern Wisconsin.

Methods - Daily and periodic water-level measurements will be made to supplement current records and gages to record pumpage will be installed on selected wells. Hydrographs of wells

will be used to determine the effects of recharge and discharge. Areas of recharge and discharge and the direction of ground-water movement will be determined. Quality of water data will be correlated with geologic information to map the geographic and stratigraphic distribution of chemical constituents that occur in critical quantities.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Wisconsin State Government

2.1152, WATER RESOURCES OF SOUTHEASTERN WISCONSIN - MILWAUKEE RIVER BASIN

R.D. HUTCHINSON, U.S. Dept. of Interior, Water Resources Division, Madison, Wisconsin

Purpose: To determine the quantity and quality of water available for use in the Milwaukee River basin in southeastern Wisconsin and determine man's effect on this supply.

Methods: Available information on streamflow, lake stages, ground-water levels, pumpage, climate, water use, geology, and quality of water will be compiled and additional data will be collected to determine the quantity and quality of water available for man's use. Seepage measurements will be made and a ground-water flow map prepared to determine the interrelationship of ground to surface water. Man's effect on the water supply will be determined by relating water use to the piezometric surface, water quality, and surface and ground-water conditions and by projecting anticipated water use to a definite future date and illustrating effects of alternate water-use possibilities.

2.1153, PLANT-AVAILABLE PHOSPHORUS STATUS OF LAKES

D.E. ARMSTRONG, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

The proposed research plan involves evaluation of the role of phosphorus in eutrophication through an understanding of the factors controlling the amount of phosphorus available to algae and higher plants in lake waters. The approach will be as follows: 1. Standardize methods for the fractionation and quantitative determination of the major forms of phosphorus in lakes, including soluble inorganic, soluble organic, microbial algal and higher plant and sediment phosphorus. Forms of organic phosphorus and the total organic and inorganic phosphorus in the seston and sediments will also be investigated. 2. Determination of the relative rates of fixation of plant-available phosphorus in lake waters by microorganisms, sediments and higher plants as affected by environmental conditions, employing ^{32}P -labeled phosphorus compounds. 3. Establish relationships between the forms and amounts of fixed phosphorus in lakes and the actual and potential amounts of phosphorus available for aquatic plant uptake.

Experiments will involve simulated lake environments in the laboratory and analyses of samples taken from lakes at different stages of eutrophication.

2.1154, SIMULTANEOUS RADIATION, CONVECTION AND CONDUCTION IN A TRANSPIRATION PROCESS

W.A. BECKMAN, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

Recent investigations concerning a fluid flowing normal to a porous bed with energy transfer by simultaneous radiation, convection and conduction have neglected the temperature difference between the fluid and the bed. For a large range of the independent parameters which describe transpiration systems, this assumption can lead to significant errors. It is proposed to analytically determine the temperature distributions in both the fluid and bed. From this information, engineering design data such as the maximum fluid and bed temperatures, the net radiant flux leaving the porous bed and the cooling (or heating) effectiveness will be obtained.

2.1155, SIMULATION MODEL FOR THE STUDY OF THE HYDROLOGY OF THE WISCONSIN RIVER

I.K. FOX, Univ. of Wisconsin, Water Resources Center, Madison, Wisconsin

The objective of this study is to develop a simulation model dealing with the hydrology of the Wisconsin River system. The model is to be designed to estimate by the use of an electronic computer the stream flow characteristics at any desired location in the basin under different hydrologic conditions and alternative reservoir operation practices. This model is to have three main characteristics, namely (1) the capability for providing a natural simulated hydrology for the main stem and major tributaries, (2) the capability of simulating the operation of the present reservoir system and proposed additional reservoirs, (3) the capability of estimating flow characteristics for desired time scales such as a day or a month, (4) the capability of assimilating specific B.O.D. loadings at various points in the Wisconsin River system.

By the use of hydrologic data for the Wisconsin River Basin a model is to be devised to simulate stream flows and reservoir functions.

2.1156, THE RELATION OF ENVIRONMENT CONDITIONS TO THE WATER POTENTIAL OF PLANT LEAVES

W.R. GARDNER, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Water is an important factor in the plant environment. An adequate description of the relation of plants to their environment must take into account the dynamics of water transport, through the plant, from the soil to the atmosphere.

The objective of this project is to obtain a better understanding of this transport process in order to develop a quantitative description which will satisfactorily relate the water potential of plant leaves to the soil water potential and to appropriate atmospheric variables.

The procedure will be to conduct experiments on suitable plants both in controlled environments such as growth chambers, and in the field. The water potential in the soil profile, and in the plant will be monitored. Atmospheric factors will be controlled or measured.

Wisconsin State Government

2.1157, WATERSHED WATER BUDGET

W.R. GARDNER, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

The relation between the rainfall on a watershed and the runoff from it is a fundamental problem in hydrology. The present practice of treating interrelationship between the various components of the water budget empirically is a barrier to further progress in solving this problem. It is the objective of this project to develop relations between the surface and subsurface components based upon the processes involved.

The procedure will be to instrument a small agricultural watershed so that the rainfall, runoff, evapotranspiration, soil water content, and deep percolation can be monitored continuously. The field data will be supplemented by model studies of idealized watersheds and mathematical solutions of relevant water transport problems. Present mathematical theories will be tested and improved where possible.

2.1158, EFFECT OF METABOLIC ANTITRANSPIRANTS ON INTERNAL WATER BALANCE, GROWTH AND SURVIVAL OF OUTPLANTED TREES

T.L. KOZLOWSKI, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

(1) To characterize the degree of water stress developed in outplanted trees, (2) to determine effects of metabolic antitranspirants on internal water balance, stomatal closure, and root permeability of tree seedlings, (3) to determine effects of metabolic antitranspirants on growth and survival of outplanted nursery stock.

DESCRIPTION OF WORK PROPOSED: Water stress will be determined as leaf water potential or relative turgidity and as leaf and stem shrinkage in both gymnosperm and angiosperm seedlings. After treatment with metabolic antitranspirants water absorption will be determined with potometers. Transpiration will be determined microscopically on silicone rubber leaf impressions. Effects on root permeability will be determined as amount of water moved through roots per unit time under constant suction before and after treatment. Growth and survival of treated, outplanted trees will be studied in nursery and field plots.

2.1159, UNSTEADY FLOW OF GROUNDWATER--DISPERSION AND SALT WATER INTRUSION IN NON-HOMOGENEOUS MEDIA

P.L. MONKMEYER, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

In the study of dispersion in non-homogeneous porous media, a general solution for the distribution of a contaminant in one dimensional flow through a layered or continuously graded media has been obtained. For two and three layer systems, the solution has compared very well with experimental data. The solution can be adapted to non-uniform flows. Currently, additional experiments are being carried out to verify the theoretical model.

Subsequently, the work will be extended to salt water intrusion in non-homogeneous, coastal aquifers. This investigation will involve analytical and experimental models of the instantaneous and quasi steady salinity and velocity distributions in confined, layered aquifers. The influences of dispersion and pumping and recharging wells will be considered.

2.1160, SOIL EROSION PROBLEMS IN WISCONSIN

A.E. PETERSON, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Objectives: To develop and determine effectiveness of various methods of controlling water runoff and soil erosion on relatively large fields with moderate slopes. Forage crop and pasture studies and their effect on soil and water yield from watersheds.

Description of Work: New tillage practices in combination with herbicides and fertilizers have changed crop production practices drastically. Studies will be initiated and expanded to include:

1. Minimum soil tillage methods combined with herbicides in growing, rotational or continuous corn.
2. Development of more effective methods of pasture improvement including both mechanical and chemical renovation, each alone and in combination.
3. Maintenance of legume stands and yields as affected by different cropping, fertility and tillage systems.
4. Use of new field test equipment, particularly the 'infiltrometer', to appraise effects of soil and crop practices by applying water in simulated rainfall.
5. Surface evaporation and rates of water use by crops.

SUPPORTED BY Wisconsin State Government

2.1161, INVESTIGATION OF THE CIRCULATION OF LAKE SUPERIOR

R.A. RAGOTZKIE, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The overall goal is to describe and explain the general circulation of Lake Superior throughout the year. Studies have revealed that there are persistent cold cells in Superior, at least until early August, and a narrow and relatively fast surface current flowing northeast along the Keweenaw Peninsula.

2. WATER CYCLE

Gradient currents calculated from temperature cross-sections in the nearshore region north of the Keweenaw Peninsula indicate currents velocities excess of 1 knot flowing in a northeastward direction. Current measurements from buoys confirm these calculated currents. This boundary current flows from mid-June until at least early September.

Theoretical studies have shown that for a stratified fluid in an enclosed basin the size of Lake Superior, the natural free mode of circulation includes high velocity boundary currents in a cyclonic direction. These may also occur in Lakes Huron and Ontario.

Circulation studies in a rotating laboratory model of Lake Superior also suggest this circulation in the epilimnion. Further analysis of field observations and laboratory experiments is continuing. Additional airborne infrared temperature mapping and in situ current measurements are planned.

2.1162, ECOLOGY OF CLOSTRIDIUM BOTULINUM TYPE E IN GREEN BAY

H. SUGIYAMA, Univ. of Wisconsin, Graduate School, Madison, Wisconsin

The presence of Clostridium botulinum type E in and on the fish of the Great Lakes constitutes a botulism hazard. The organism is particularly prevalent in Green Bay, not only in fish but also in environmental samples. The very low incidence of type E in the soil away from the aquatic environment suggests that passive accumulation of the organisms being carried down from the surrounding land mass is not the only explanation for this distribution. Attempts will be made to show the multiplication of type E in the bay itself. Other sources of the organism which contribute to the maintenance of the type E population in Green Bay will be studied. Effects of other microflora in limiting the growth of type E will be investigated. Contributions of industrial wastes and treated sewage to the growth of type E will be sought. Factors which prevent the multiplication of the botulinal organism in the living fish will be studied. Improvements in the procedures for the detection and isolation of type E from natural samples will be attempted. The relationship between C. botulinum type E and non-toxicogenic 'E-like' will be studied.

2.1163, ESTIMATE OF ACTUAL DAILY EVAPOTRANSPIRATION AS A FUNCTION OF SOIL WATERFLOW, PLANT CANOPY AND POTENTIAL EVAPOTRANSPIRATION

C.B. TANNER, Univ. of Wisconsin, School of Agriculture, Madison, Wisconsin

A thorough effort to combine knowledge of atmospheric stress, plant characteristics, and soil influence on adsorbed water into a rational estimate of evapotranspiration.

SUPPORTED BY U.S. Dept. of Commerce - E.S.S.A.

2.1164, EVAPORATION MECHANISMS

C.B. TANNER, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Objectives: 1. Determine the evaporation mechanism and cause of diurnal evaporation variation at bare soil surfaces when evaporation is limited primarily by capillary flow to the surface.

2. Determine the vapor diffusion resistances at plant leaves and in plant canopies and how they depend upon the leaf properties, canopy structure characteristics, and the major microenvironment properties.

Description: We will measure the vapor diffusion resistances at the soil surface-atmosphere boundary and determine how this is affected by thermal stratification, pressure fluctuations of the turbulent atmosphere and by heat supply. We will follow a similar approach with leaves, but must also be concerned with stomata distribution, leaf roughness.

2.1165, THE EFFECT OF HETEROGENEITIES OF THE SOIL UPON INFILTRATION

G.W. THURTELL, Univ. of Wisconsin, Agricultural Experiment Sta., Madison, Wisconsin

Objectives: To develop a new model to describe infiltration as effected by soil heterogeneities, by using recent advances in continuum mechanics of mixtures, and to test the model with data from the literature and from laboratory and field experiments as needed.

Description: Current theories and models which describe infiltration into either homogeneous or layered soil, fail when applied to a soil which contains heterogeneities such as cracks, aggregates, worm holes, roots, pockets of clay.

We propose to apply to the infiltration model recent developments in continuum mechanics of mixtures used in petroleum engineering to describe the flow of petroleum in cracked rocks.

2.1166, APPLICATION OF MAGNETOHYDRODYNAMICS TO MEASUREMENT OF LIQUID VELOCITY AND TURBULENCE

J.R. VILLEMONT, Univ. of Wisconsin, School of Engineering, Madison, Wisconsin

This project deals with studies to determine the feasibility of applying the basic principles of magnethydrodynamics to the measurement of turbulence in liquid flow, the measurement of time-smoothed liquid flow velocities, and the measurement of eddy diffusion. A three element, two-dimensional probe is being developed which will permit the observation of two components of the velocity fluctuations simultaneously and analyze them with analog techniques in such a way that three Reynolds' stresses can be calculated. These stresses will be used to check the validity of the Reynolds, equations for turbulent motion for flow in circular closed ducts, assuming that the turbulence is isotropic normal to the flow direction.

A special drogue is being developed to yield a magneto-hydrodynamic signal which will be used to measure the time-smoothed local velocity. This device will be used as a current meter and also as a velocity meter in lakes and oceans as well as in large pipes.

A one-dimensional probe will be developed for the measurement of turbulent mass transfer. It will be used with the two-dimensional probe to study the spreading of buoyant jets discharged into stratified fluids (e.g. jet diffusers in sewage outfalls) and also the mixing between horizontally moving stratified layers, such as density currents in lakes, rivers, and estuaries.

As a result of the objectives of this program, it is hoped that a more detailed understanding of the mechanism of turbulence and its analysis will lead to useful solutions of a wider variety of problems involving turbulent motion in many areas of water resources engineering.

2.1169, SEDIMENTARY FACIES IN LAKE BUTTE DES MORTS, WISCONSIN

J.W. MCKEE, Wisc. State University, Graduate School, Oshkosh, Wisconsin 54902

Lake Butte des Morts is a shallow, highly eutrophic lake which is undergoing rapid changes--some natural, some caused by man. Because of the importance of this and adjoining lakes to the large number of people who live nearby, management programs are desirable. But many of these should not be attempted until a greater understanding of physical processes in this lake is attained.

Toward this end a series of studies is being planned. This study (the first of the series) will result in a description of the present distribution of sediment types in Lake Butte des Morts. Samples will be taken from short cores, then subjected to standard laboratory procedures for determination of composition and of grain size mineral sediments. Isopleth maps will be constructed to show: 1. Proportion of organic matter or of mineral matter. 2. Mean grain size of sands. 3. Sorting.

A bathymetric chart will be constructed for comparison with previous data in order that the filling rate may be estimated.

2.1170, MICROCLIMATIC FACTORS FOR FOUR PLANT COMMUNITIES ON ELK MOUNTAIN

T.L. LOUDON, Univ. of Wyoming, Agricultural Experiment Sta., Laramie, Wyoming 82071

Objectives: To study the effect of sagebrush control on (1) moisture retention and depletion in the soil, (2) the total energy balance over the plant canopy, and (3) stands and production of native forage and weedy species, and to describe and map various plant communities at four different elevations on the Northwest exposure of Elk Mountain and to relate them to certain hydrologic parameters within these plant communities.

Description of work: Periodic measurements of soil moisture will be taken with a neutron probe at 3 locations in each of 5 replicated plots in unsprayed and sprayed sagebrush. Periodic data on solar radiation, net radiation, reflected short wave radiation and soil heat flow will be measured and a vertical energy balance will be made. The major plant communities at four elevations on Elk Mountain will be determined and mapped and correlated with measured precipitation, air and soil temperature, wind velocity, soil moisture and snow accumulation at the four sites at different elevations.

SUPPORTED BY Wyoming State Government

2.1171, MINERAL NUTRITION AND PLANT GENETIC VARIABILITY

M. SARIC, Fed. Inst. For Int. Tec. Coop., Belgrade, Yugoslavia

Object: To study the effect of mineral nutrition and the genetic variation of plant species on transpiration and the forms of water found in plants and the relation of mineral nutrition and water levels to plant growth.

Plan of work: Transpiration, water-forms in the plant, and plant growth will be evaluated under controlled conditions and different moisture and plant nutrient levels on a number of genotypes of wheat. Transpiration will be measured by direct loss of weight procedures and reported as water loss per unit of leaf area. Free and bound water will be measured by placing leaves in a sugar solution and determining the concentration of the sugar in the solutions with a refractometer before and after immersion of the leaves. Dry matter gain on a weight basis will be used as an index of growth. Chemical composition of plants and soil will be made using standard analytical methods. Histological studies to determine the number and size of leaf stomata will be made.

SUPPORTED BY U.S. Dept. of Agriculture

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic Use; Conservation in Industry; Conservation in Agriculture.

3.0001, SOYBEAN YIELD AND QUALITY AS AFFECTED BY CLIMATIC, CULTURAL AND SOIL FACTORS

D.I. THURLOW, Auburn University, Agricultural Experiment Sta., Auburn, Alabama 36830

Objectives: (1) To determine effects of environmental conditions (Soil moisture stress, temperature, daylength) and weed competition on soybean yield and quality, and to relate these effects to long term climatic data by regions in Alabama in predicting crop performance. (2) To determine influence of cultural factors on soybeans, including plant population and irrigation for double cropping and full-season plantings, and use of selected growth regulators. (3) To determine influence of certain soil factors on soybeans, including fertility levels, placement of fertilizers and lime in subsoils in mulch planting, and traffic pan disruption; and to obtain soil productivity indices.

Description of Work: Investigate moisture stress at different stages of growth and microclimate in growth chambers and relate long-term climate records to crop performance by regions of the State. Field studies on weed competition for moisture, growth regulators and plant populations in double cropping and full-season plantings. Investigate feasibility of irrigation for double cropping of soybeans with other crops. Calibrate soil tests by crop response on wide range of fertility levels. Vary placement of fertilizer and lime in subsoils for mulch planting, and study effects of traffic pan disruption. Conduct maximum yield tests for productivity indices.

3.0003, DEMINERALIZATION BY FORCED-FLOW ELECTRO-DESALINATION

E.W. LANG, Southern Research Institute, Birmingham, Alabama

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

We will continue the development of the forced-flow electromembrane process in which solution is demineralized in very thin compartments (5 to 20 mils) formed by cation- and anion-selective membranes. Bench-scale units that utilize multimembrane stacks with compartment dimensions of 5 x 12 inches and about 18 x 20 inches will be used in developing the process to the point it will be ready for evaluation on a pilot-plant scale. The major effort will be on development of designs for forced-flow compartments and stacks that will permit realization of the economic advantages provided by the high limiting current density of the process.

Studies will be made of the effects of design and operating variables on demineralization performance. We expect to develop empirical expressions by statistical analysis of the results that will permit prediction of the performances of forced-flow demineralizers when operated under a wide range of conditions.

We will develop and evaluate promising design concepts and select the designs and levels of operating parameters that give lowest fixed and operating costs. Demineralization runs will be made with a number of different synthetic brackish waters and a wide range of operating conditions to more fully evaluate designs and performance.

Economic analyses of the process will be made as experimental data becomes available, and preliminary cost estimates for a full-scale plant will be prepared. Plans will be presented for a pilot-plant evaluation program.

Phoenix City Government - Arizona

3.0006, PRINCIPLES, FACILITIES, AND SYSTEMS FOR WATER HARVEST

L.E. MYERS, U.S. Dept. of Agriculture, Phoenix, Arizona

Objective: Develop and evaluate principles, methods, materials, and design criteria for collecting and storing precipitation for agricultural and rural water supplies.

Plan of Work: Develop mathematical and physical models, including rainfall simulation, to determine the influence of catchment size, shape, roughness, permeability and location on precipitation runoff. Test laboratory developments, new construction materials, and catchment and storage designs with field installations with cost methods and materials.

SUPPORTED BY U.S. Dept. of Agriculture

3.0007, GROUND WATER IN RELATION TO USE AND MANAGEMENT OF RANGELAND WATERSHEDS IN THE SOUTHWEST

R.B. HICKOK, U.S. Dept. of Agriculture, Tucson, Arizona

Objective: Develop methods for predicting ground water recharge from runoff transmission losses, for reducing non-beneficial consumption of such water detained in valley alluviums, and for evaluating potentials for local water supplies from runoff transmission losses geologically excluded from a regional aquifer.

Plan of Work: Maintain observations of ground water levels in and adjacent to experimental watersheds as related to storm flows and evaporation from dry channel surfaces and transportation of riparian vegetation, determine hydraulic character of aquifers and estimate ground water storage changes and subsurface flows affecting the total water budget.

SUPPORTED BY U.S. Dept. of Agriculture

3.0008, VEGETATION MANIPULATION EFFECTS ON RUNOFF - SYCAMORE CREEK, ARIZ

H.W. HJALMARSON, U.S. Dept. of Interior, Water Resources Division, Tucson, Arizona

This research is part of the program of water resources investigations conducted by the U. S. Geological Survey in cooperation with State and local agencies in Arizona.

Purpose - To evaluate the effects of watershed treatment upon water-yield and sediment-yield characteristics of the East Fork Sycamore Creek watershed.

Methods - Runoff from the East Fork Sycamore Creek watershed where it is proposed to eradicate some of the vegetation will be determined and compared with the runoff from two adjacent watersheds of approximately equal size which will not be treated.

A rain gage network of about 10 recording and 6 nonrecording gages will be established along the rims of the watersheds and at various altitudes within each watershed.

Data from the watersheds will be collected before and after treatment of the East Fork Sycamore Creek to allow computation of total sediment loads and also to determine the particle-size distribution of the fluvial sediment.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey
Arizona State Government

3.0009, HYDROLOGIC EFFECT OF VEGETATION MODIFICATION

R.M. MYRICK, U.S. Dept. of Interior, Water Resources Division, Tucson, Arizona

The intense and increasing demand for water in the Salt River basin indicates the need for developing all possible sources. Substitution of short rooted grasses for deep rooted trees has been proposed as a method of increasing water yield.

The purpose is to evaluate the change in water yield produced by the proposed vegetation modification and to develop a more comprehensive understanding of the function of vegetation within the hydrologic regime under semiarid conditions.

Data are collected on two adjacent basins in Arizona; one basin will be cleared after a satisfactory calibration for the digital computer model has been obtained. The second basin will remain unaltered and used to improve the model and test the accuracy of the hydrologic equation that has been established. If further investigations are warranted the second basin will be cleared at a later date.

3.0010, GENETIC AND CYTOGENIC STUDIES OF HORTICULTURAL CROPS-BREEDING XEROPHYTIC CUCURBITA

W.P. BEMIS, Univ. of Arizona, School of Agriculture, Tucson, Arizona 85721

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Six xerophytic species of Cucurbita (*C. digitata*, *C. cylindrata*, *C. palmata* and *C. foetidissima*) indigenous to southwestern United States and northwestern Mexico are being studied from the viewpoint of (1) their intrinsic properties as associated with arid environments, (2) their interspecific relationships within the xerophytic group and (3) their interspecific relationship with cultivated mesophytic species.

A permanent colony of the xerophytic species is being developed on a marginal (sandy) soil area at the Campbell Avenue Farm of the University of Arizona, Tucson. The purpose of this planting is to observe the mode and rate of colony establishment, proliferation and longevity under minimal water applications.

Preliminary data on species relationships indicate the xerophytic complex, with the exception of *C. foetidissima*, to be variants within a common species.

Interspecific crosses to cultivated mesophytic species have resulted in sterile F1 hybrids. Progress is proceeding toward the development of amphidiploids in these sterile hybrids as a means of restoring fertility.

SUPPORTED BY University of Arizona

3.0011, SPRINKLER IRRIGATION OF COTTON WITH HIGH SALT-CONTENT WATER

C.D. BUSCH, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives: To determine if cotton can be successfully irrigated with highly saline water under the conditions of the Upper Gila Valley.

Cotton plots will be sprinkler irrigated with water in the range of 4.2 to 4.6 millimhos/cm. Salt accumulation on foliage and in the surface soil and its effect on plant performance will be measured. Comparison will be made of salt effects in response to temperature and humidity at the time of sprinkling, soil surface geometry and cotton species.

SUPPORTED BY U.S. Dept. of Agriculture
Arizona State Government

3.0012, DEVELOPMENT OF ECONOMIC WATER HARVEST SYSTEMS FOR INCREASING WATER SUPPLY

C.B. CLUFF, Univ. of Arizona, Water Resources Research Ctr., Tucson, Arizona 85721

Initial investigations have indicated that gravel covered membranes and sodium treated soil provide an economical method for increasing water yields.

For practical application, methods will be developed to lay a membrane and cover it with gravel extracted from the soil. Gravel can also be used to provide erosion control for a heavy treatment of sodium chloride. Considerable emphasis will be made to evaluate the possibility of a lighter rate of application of sodium chloride to increase water yield without appreciably affecting plant growth. Thus the plant cover would serve to minimize erosion. The use of fertilizer to offset the reduction in plant growth will be studied.

The proposed research plan will involve laboratory and field investigations. Laboratory investigations will be used to determine effect of various levels of sodium chloride on the infiltration rate of distilled water on various range soils in Arizona. These will be coordinated with infiltration tests in the field using a rainfall simulator. Field tests will also be made using a sodium treatment with a gravel cover for erosion control. The effects of sodium chloride treatment on grasses and the use of fertilizer to offset this effect, will be studied on field plots. Gravel covered membrane catchments will be installed and evaluated.

A computer model will be developed in an attempt to predict salt treatment rates and expected water yields.

University of Arizona

3.0013, PREDICTING THE EFFECT OF WATER QUALITY AND GYPSUM ON THE CHEMICAL AND PHYSICAL PROPERTIES OF SALINE AND ALKALI SOILS

G.R. DUTT, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives: a. To establish basic principles interrelating cation distribution in irrigation waters, soils and soil solution at the bottom of the root zone with certain physical properties of the soil. b. To develop a method to calculate the amount of gypsum and irrigation waters of different qualities to reclaim sodium affected soils.

Procedures: Several soils from Arizona will be tested to see if there is a reasonable fit between the soils and a mathematical model which has been developed to calculate distributions of ions in soil systems. If there is a fit, a computer procedure will be developed to calculate the amount of gypsum that must be added to a soil to achieve a desired Ca distribution. This procedure would consider irrigation waters of different qualities. Also, a laboratory column study will be initiated to see if the method can be used for the purpose indicated above. Upon completion of the column study a field evaluation of the method will be made.

3.0014, MANAGEMENT OF SALINE WATER FOR CROP PRODUCTION

W.H. FULLER, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Both surface waters collected and stored behind dams as well as certain underground waters are becoming increasingly saltier with time. Such waters must either be managed more carefully if economic crop production is to be maintained or supplemented by waters of better quality. In either instance new and more effective water management principles must be developed to overcome detrimental effects on crop production associated with change in water quality.

In the Southwest it is not always possible to obtain new sources of water of good quality to supplement or replace poor sources. The exception to this, however, is the South Gila River valley where Colorado water is now just being introduced. The effect of this good quality water on the soils that have accumulated high concentrations of salts, including sodium, is being studied. Most of the research is designed to avoid any dominance of the monovalent cations over the divalent cations which would result in impedance of infiltration and poor internal soil drainage. In such areas as the upper Gila, Santa Cruz and Pecos Rivers good quality of waters are being rapidly depleted. Poor quality waters must be used. Basic principles are being developed in the use of these waters. Research is centering around water management to prevent excessive accumulation of salts in the root zone and maintenance of a favorable balance of divalent over monovalent cations.

The research is being continued on State funds for which there has been no project number assigned as yet.

SUPPORTED BY University of Arizona

3.0015, A UNIFIED APPROACH TO WATER, FOOD AND POWER IN A COASTAL DESERT COMMUNITY

C.N. HODGES, Univ. of Arizona, Inst. of Atmospheric Physics, Tucson, Arizona 85721

The University of Arizona is developing a combination system for providing power, water and food. The system is designed for use, initially at least, in a coastal desert area.

Power is generated by a diesel-electric set. Waste energy from the diesel engine is utilized to heat seawater for a humidification desalination plant. The waste seawater from the desalination plant is used to provide the temperature and humidity control for a closed-environment greenhouse. Carbon dioxide from the diesel engine exhaust is used in the closed greenhouse to accelerate plant growth.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Various experimental components of the system have been constructed and tested at the Environmental Research Laboratory, Tucson, Arizona. A pilot facility is being developed at Puerto Penasco, Sonora, Mexico, in cooperation with the University of Sonora.

3.0019, OPTIMIZING SALVAGEABLE WATER RESOURCES IN A SEMI-ARID INLAND BASIN
W.G. MATLOCK, Univ. of Arizona, School of Agriculture, Tucson, Arizona 85721

The purpose of the proposed study is to optimize salvageable water resources in a semi-arid inland basin.

Salvageable water resources, namely, flood runoff and industrial and municipal waste water, will be characterized, according to sources, quantity and quality (physical, chemical, and bacteriological). Treatment procedures required to make the potentially salvageable water suitable for municipal (including recreation) and industrial use will be evaluated.

The hydraulics of natural recharge from sandy ephemeral stream channels will be studied. Analytical theories for defining the growth and dissipation of a ground-water mound will be evaluated.

The management alternatives, within the framework of existing studies, for optimizing and conservation, use and reuse of salvageable water supplies will be determined and evaluated for the Tucson Basin.

3.0021, MANIPULATION AND MANAGEMENT OF SECOND GROWTH PONDEROSA PINE FOR OPTIMUM YIELDS OF WATER AND/OR WOOD AND FORAGE
P.B. ROWE, Univ. of Arizona, Agricultural Experiment Sta., Tucson, Arizona 85721

Objectives: To determine how much and under what conditions water, wood and forage yields can be improved by manipulation and/or control of vegetation.

Specific objectives are: 1. To determine how precipitation is distributed among interception, infiltration surface runoff, evaporation, transpiration and effluent soil seepage under conditions of natural, undisturbed vegetation. 2. To determine how much, in what way, and under what conditions of climate, soils, geology, and topography yields of water, wood and forage can be modified by manipulation and management of vegetation. 3. To determine the interrelations among water, wood and forage yields as modified by vegetation manipulation.

Work Proposed: This project will be concerned primarily with quantitative evaluations of basic processes influencing (1) the factors involved in the disposition of precipitation and (2) the effects of the physical conditions of the environment, and changes in these conditions by vegetation, manipulation, on water yields, and wood and forage production. Such information should have direct application to other areas where adequate inventories of climate, soil, water and vegetation conditions are available. Methods employed will include analytical field and laboratory techniques, the former to be carried out on small plots or similar unit controls.

3.0022, INVESTIGATIONS ON THE SUBSURFACE DISPOSAL OF WASTE EFFLUENTS AT INLAND SITES
L.G. WILSON, Univ. of Arizona, Water Resources Research Ctr., Tucson, Arizona 85721

Artificial groundwater recharge investigations will be conducted to evaluate the applicability of recent theoretical, laboratory and field studies on mixing during miscible displacement, to waste disposal operations in inland alluvial sediments. The results will facilitate the establishment of rational guidelines for the selection and operation of artificial recharge facilities to preclude the impairment of native groundwater supplies during subsurface disposal of waste effluent in inland areas with physical controls similar to those at the experimental site.

Recharge studies will be initiated at The Water Resources Research Center Field Laboratory, The University of Arizona,

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Tucson, using a blended, cooling-tower blowdown effluent. A series of 'single-well' recharge-pumping trials will be conducted on a 150 ft deep, 20 inch diameter recharge well. 'Two-well' tests will consist of injecting effluent into the recharge well and, simultaneously, pumping from a downstream observation well. Recharge water will be tagged with fluorescent dye to facilitate preparation of breakthrough curves, using a recording fluorometer, during pumping. Tracer studies will also be conducted during recharge in a pit (100 ft x 50 ft x 10 ft, 2 1/2:1 side slopes). Water samples will be obtained from wells in the vadose and phreatic zones for preparation of breakthrough curves.

transfer coefficient is about five times higher than the evaporating heat transfer coefficient. Additional studies will further define the

3.0023, SALT TOLERANCE IN BLUE PANICGRASS, PANICUM ANTIDOTALE

L.N. WRIGHT, Univ. of Arizona, School of Agriculture, Tucson, Arizona 85721

The objectives of the research are to: (a) develop techniques to evaluate large numbers of genotypes for salt tolerance within a given species, *Panicum antidotale*, blue panicgrass, (b) isolate salt-tolerant genotypes, and (c) determine the factor(s) affecting salt tolerance of blue panicgrass.

Forty-three sources of blue panicgrass have been collected. Seed will be germinated in a germinator using several salinizing agents individually and in combination (NaCl, CaCl₂, and MgCl₂). Vigorous seedlings of each accession will be placed in soil. After establishment, the plants will be transplanted to the field in restricted recombination crossing blocks for each salinizing agent or combination. Seed from each spaced plant will be progeny tested in the germinator using the same chemicals. Recurrent selection will be made among progeny plants. The procedure will be repeated to attain maximum salt-tolerant genotypes.

Once salt-tolerant progeny have been isolated within the species, then parent and progeny plants will be compared for the physiological processes and morphological characteristics to determine the changes that may have occurred within the species.

3.0024, DEVELOPMENT OF AUTOMATED SUBIRRIGATION SYSTEM

B.B. BRYAN, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

Objectives: To determine, develop and evaluate: (1) Hydraulic problems involved in distributing water subterraneously at low pressures in small-diameter, perforated, plastic pipe for irrigation of horticultural food crops and field crops; (2) Criteria, from (1) above, for design of subirrigation systems which approach the ultimate in efficiency of water use; (3) Hydraulic criteria for distribution of fertilizers, soil fumigants, and systemic pesticides in the same irrigation system; (4) Control techniques for completely automating the agricultural irrigation system.

Description: Hydraulic problems associated with orifice preparation and spacing, and depth and spacing of plastic pipes will be done in laboratory and greenhouse. Irrigation-system-design procedure will be developed from results of laboratory data and field system will be installed and evaluated as to efficiency. Methods of introducing fertilizers and other water-soluble materials will be evaluated and developed using the field system. Automated controls, including a soil-moisture-sensing system, will be developed for the field system.

SUPPORTED BY Arkansas State Government

3.0025, DEVELOPMENT OF AUTOMATED SUBIRRIGATION SYSTEM

J.P. HOSKYN, Univ. of Arkansas, Water Resources Research Ctr., Fayetteville, Arkansas 72701

The objectives of this work are to determine, develop and evaluate: (1) hydraulic problems involved in distributing water

subterraneously at low pressures in small diameter, perforated plastic pipe for irrigation of horticultural food crops and field crops; (2) criteria, from (1) above, for design of subirrigation systems which approach the ultimate in efficiency of water use; (3) hydraulic criteria for distribution of fertilizers, soil fumigants, and systemic pesticides in the same irrigation system; (4) control techniques for completely automating the agricultural irrigation system.

Field evaluation will be accomplished at Vegetable Substation, Van Buren, Arkansas.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Arkansas

3.0026, RICE FARMS IN ARKANSAS

J.H. WHITE, Univ. of Arkansas, Agricultural Experiment Sta., Fayetteville, Arkansas 72701

(1) Relate relative efficiency of producing rice and other adapted crops to the major soil and water resources situations on rice farms. (2) Appraise costs and returns effect of irrigation of crops other than rice for each major resource situation. (3) Appraise cost and returns potentials from adoption of the best combination of improved production practices and techniques for each major resources situation. (4) Evaluate costs and returns aspects of rotations on rice farms for each major resource situation. (5) Determine relative inputs and yields for long, medium and short grain varieties of rice.

Description of Work. Work on this project involves the compiling of information from farmers, agricultural workers, service groups, and research technicians pertaining to cultural practices followed; the labor, equipment, and materials used; and the production and incomes for the established enterprises on representative farms in the rice areas of Arkansas. The objective is to discover opportunities for increasing the incomes of farmers either through more efficient management practices with the different enterprises, through shifts in the allocation of resources between enterprises, or through the use of different rotation systems. After the opportunities that appear most promising have been determined whole farm budgets of representative farms (small, medium, and large) are developed to reflect the effects which the adjustments would have on the incomes of the farmers.

3.0027, SOIL-WATER-VEGETATION RELATIONS IN THE DOUGLAS FIR ZONE

E.E. STURGEON, Humboldt State College, Graduate School, Arcata, California 95521

To initiate basic forest and watershed research in the Elder and Fox Creek watersheds so as to ascertain fundamental relationships between natural cover, stream flow and soil moisture.

Procedure: Initial research will be (1) a precipitation distribution study; (2) installation of soil moisture access tubes and measurement of soil moisture on selected plots; and (3) attendant preliminary analysis of the water balance of the area. Plans call for stream-gaging in order 1) to assess the precipitation-runoff relation under undisturbed conditions, 2) to see how it is influenced by various watershed parameters such as elevation, aspect, slope, etc., and 3) to use the area as a control against which the effects of land use on the precipitation-runoff relationships may be checked. Intensive study will be made of some of the minor drainages so as to fully assess the wildland hydrologic cycle.

3.0028, DESIGN, CONSTRUCT AND EVALUATE A 1,000 GALLON PER DAY REVERSE OSMOSIS UNIT OF RECTANGULAR CONFIGURATION

W.J. FLAHERTY, Aerojet General Corporation, Azusa, California

This contract includes three main tasks. Under economic investigations, a parametric study will be conducted and alternate materials and manufacturing methods for membrane support

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

plates will be examined. The parametric study is for the purpose of determining the capital costs for a mgd capacity Reverse Osmosis plant based on plate and frame design. Cost breakdown on a system component basis will be provided. Under rectangular plate development, an experimental program to determine commercial materials for use as porous membrane supports will be conducted as well as long-term tests to establish pressure drop with time at different feed water pressures. Hydrodynamics for the materials tested will also be determined. The third task is to develop membrane spacers for the rectangular plate design. Test fixtures and dies to evaluate molding of these supports in 18-inch square modules will be fabricated.

Finally, based on Tasks II and III, a 1000 gpd rectangular pilot plant will be designed and constructed for feeds varying from 2,000 to 25,000 ppm TDS and pressures varying from 600 to 1500 psi.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0029, OPERATION OF A 50,000 GPD PORTABLE PILOT PLANT

B. KEILIN, Aerojet General Corporation, Azusa, California

The objectives of this contract are to design and fabricate a trailer-mounted pilot plant which will produce 50,000 gpd of purified water by the reverse osmosis process; to design and fabricate pretreatment facilities to prepare raw well water for use in the pilot plant; to prepare a test site; and to conduct field testing of this equipment fabricated.

Last year, performance tests were conducted to arrest the rapid flux decline and to test the use of wash solutions in removing accumulated membrane deposits. A bench-scale test program and the construction of a 14-inch reverse osmosis unit used to field test the manganese zeolite on a small scale are recent projects.

New membranes have been installed in the unit in preparation for a demonstration on manganese zeolite treated feed.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0030, A STUDY OF MEMBRANES FOR DESALINATION BY REVERSE OSMOSIS

C.W. SALTONSTALL, Aerojet General Corporation, Azusa, California

A fundamental investigation of reverse osmosis membranes is being continued in order to gain a broad basic understanding of the relationship between membrane fabrication techniques, chemical and physical characteristics of the membrane, and the reverse-osmosis transport properties.

In previous work it was discovered that the diffusion coefficient of salt in cellulose acetate depended upon the drying conditions used in preparing the dense films; this dependence is being more completely examined. The relationship of the salt permeation of membranes heat-treated at different temperatures to the electrical conductivity of the membranes is being determined.

Previous work was conducted to relate the rate of flux decline and the compressive mechanical properties of the membrane. In the current work the dependency of the rate of flux decline upon the initial membrane flux and the method of membrane fabrication is being examined.

Work is being conducted to determine if better or more uniform membranes can be prepared by gelling the casting solution in different types of organic solvents rather than in water.

New methods to measure properties of the active layer surface of anisotropic membranes are being examined. For example, attenuated total-reflectance, infrared spectroscopy is under investigation as a means to determine the chemical composition of the surface.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0031, RESEARCH AND DEVELOPMENT OF NEW POLYMER SYSTEMS FOR REVERSE OSMOSIS MEMBRANES

C.W. SALTONSTALL, Aerojet General Corporation, Azusa, California

A program of polymer synthesis for new osmotic membranes is being continued. The objective of the program is to discover polymers which will provide reverse osmosis membranes superior to the current cellulose acetate membranes.

In earlier work on this program, polyacrylonitrile and poly(vinylene carbonate), selected for their chemical stability and mechanical strength, were investigated in the preparation of new membranes. Films (about 7 microns or thicker) of poly(vinylene carbonate) were found to have water transport properties superior to those of cellulose acetate and a theoretical salt rejection capability of greater than 98%. Thinner films of the new polymer, however, showed mechanical break-down under reverse osmosis testing because of brittleness. Therefore, in current work, efforts are being made to prepare internally plasticized polymers of vinylene carbonate through copolymerization with vinyl acetate and vinylpyrrolidone. Externally plasticized films of poly(vinylene carbonate) will also be examined for mechanical and reverse osmosis properties.

Polymers based on methacrylonitrile and comonomers such as acrylamide, methyl vinyl ketone and vinylpyrrolidone will also be investigated for use in the preparation of membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0032, MANAGEMENT FOR IMPROVEMENT OF WATER YIELD IN THE CONIFER ZONE OF CALIFORNIA

J.L. SMITH, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Berkeley, California

Object: To develop a hydrologic base for land management decisions, including understanding of the physical processes affecting snow accumulation and melt, interception of precipitation, and evapotranspiration as affected by vegetation, forest conditions, terrain and soil.

Plan of Work: The project staff is perfecting a radioactive snow gage that has recently been developed by the project. With it they will continue to study snow accumulation and melt as affected by the forest and by timber-cutting patterns. They are also studying water movement in soils and plants. The studies are conducted in the laboratory on sample plots and on experimental watersheds. Phosphorescent (ultraviolet) and nuclear tracers are used in snow studies and water movement studies.

SUPPORTED BY U.S. Dept. of Agriculture

3.0033, A MASS TRANSFER STUDY OF CURRENT REQUIREMENTS FOR CATHODIC PROTECTION

I. CORNET, Univ. of California, School of Engineering, Berkeley, California 94720

Work completed to date (Cornet, I., Pross, T. W., Jr. and Bloom, R. C., 'Current Requirements for Cathodic Protection of Disks Rotating in Salt Water -- A Mass Transfer Analysis,' International Congress on Fouling and Marine Corrosion, Cannes, France, June 1964 - in press-), shows quantitatively that the current required for cathodic protection of rotating disks in salt water and in sea water is proportional to mass transfer of oxygen to cathodic surfaces. This work has however been limited in range of temperature and flow conditions. It is proposed to extend the investigation to a range of temperatures, and to Reynolds numbers beyond the capabilities of the present experimental equipment, into a range where cavitation may occur.

It is proposed to use a rotating disk apparatus at the beginning. Equipment and experience are already available, and results may be correlated with hydrodynamic, heat transfer, and mass transfer studies which have been published for rotating disk systems. It is proposed, however, to extend this investigation to the cathodic protection of other than rotating surfaces. The need for knowledge of cathodic protection requirements under heat transfer conditions will be kept in mind, and preliminary experiments will be undertaken.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0034, RELATIONSHIP BETWEEN IRRIGATION WATER COMPOSITION AND SOIL PROPERTIES

R.K. SCHULZ, Univ. of California, Agricultural Experiment Sta., Berkeley, California 94720

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

It is the purpose of this research to examine, in a highly instrumented and carefully controlled intermediate field study, various theories which have been proposed and tested in the laboratory and to establish principles and procedures that can be used in coping with agricultural problems relating to the use of irrigation water on arid lands. Where necessary, new theories will be formulated and tested. It is the primary concern of this project to aid in obtaining permanence of agriculture on irrigated arid soils by developing an understanding of the mechanisms of salinity accumulation and permeability problems resulting from increases in the level of adsorbed sodium.

A long term field experiment is to be carried out at the Kearney Horticultural Field Station, near Reedley, California. Forty eight plots, 1/100 acre each, have been constructed by bordering the soil to a depth of five feet with concrete and a plastic membrane. Each plot is to be a completely defined system with all important measurements recorded, and this data is to be handled by computer techniques, that is, the amount of water and salt entering the system, rate of infiltration into the soil, movement of water, salts, oxygen and carbon dioxide within the soil, and losses of salts by leaching and crop removal. A building containing a controlled temperature instrument room and facilities for preparing synthetic irrigation waters has been constructed. Instrument development is now underway.

The first experiments will be carried out in nine plots planted to ladino clover. The plots will be irrigated with nine different irrigation waters which contain varying amounts of sodium, calcium, bicarbonate, chloride and sulfate ions.

SUPPORTED BY University of California

3.0035, STUDY OF MASS TRANSFER THROUGH MEMBRANES

K.S. SPIEGLER, Univ. of California, School of Engineering, Berkeley, California 94720

Study of polarization phenomena at membrane-solution interfaces by electrochemical and optical methods. The study is to cover both reverse osmosis (hyperfiltration) and electrically driven processes (e.g., electrodialysis), and will stress the physico-chemical hydrodynamics of membrane-solution interfaces, which are a common feature of all membrane separation methods.

Specifically it is planned to perform (a) a detailed mass-transfer study in a large single ion-exchange membrane module which simulates the conditions in a plant-size electrodialysis stack, and thus determine the influence of turbulence-promoter geometry on polarization (b) a study of electrical potential differences which develop across reverse-osmosis membranes, as a function of pressure, hydrodynamic factors and solution type and (c) optical studies, by laser interferometry, in small membrane cells, designed to lead to the development of large cells for the observation of the interfacial phenomena at normal and high pressures.

3.0037, MANAGEMENT PRACTICES FOR SALINE AND SODIC SOILS IN IMPERIAL VALLEY

W.F. SPENCER, U.S. Dept. of Agriculture, Brawley, California

Objective: To develop soil, water, and crop management practices for optimum production and high water use efficiency, of crops growing on salt-affected soils in the Imperial Valley.

Plan of Work: The distribution and quantity of salts and exchangeable cations in saline soils as affected by water quality, drainage, amendments, crops, and soil management practices and the resultant effect on crop production and water-use efficiency will be evaluated. For this purpose field experiments with controlled variables of amendments, crop culture, irrigation, or drainage practices will be used. Salt distribution variability will be evaluated in order to develop sampling procedures for evaluating the salinity status of farming units accurately enough for making decisions concerning effectiveness of management practices for removal of soluble salts and exchangeable sodium. Practices which will be evaluated for growing crops on highly saline soils are tillage and residue management, deep profile modification, surface stabilization for water infiltration improvement, planting methods, bed shapes, and methods and timing of irrigations.

Cooperation: Agricultural Experiment Stations, SCS, U. S. Bureau of Reclamation, State Engineers, State Water Resources Agencies, and other irrigation, water management, or soil conservation district agencies.

SUPPORTED BY U.S. Dept. of Agriculture

3.0038, IRRIGATION AND EVAPOTRANSPIRATION OF WATER FOR CROPS IN IMPERIAL VALLEY

L. WILLARDSON, U.S. Dept. of Agriculture, Brawley, California

Objective: To determine optimum water application rate for slope, soil type, intake rate, crop and root-zone water storage capacity. Relate energy budget to seasonal, monthly, and peak consumptive-use rates. Design semiautomated irrigation systems for these circumstances.

Plan of Work: Determine crop, soil, and topographic adaptability of different water application techniques and overall system efficiency. Study hydraulic factors governing flow in irrigation furrows and borders to develop equations for rate of advance and row length-grade criteria for control of erosion. Develop methods for metering water intake rates, water holding capacities, and internal transmission rates of moisture for different soils. Determine proper timing and amount of irrigation for efficient use of water supplies using lysimeters. Gather data on energy budget and develop prediction methods for water requirements of crops. Design improved equipment and systems for measurement and application of water including automatic systems.

3.0039, ELECTROCHEMICAL DEMINERALIZATION OF BRACKISH WATER

S. EVANS, North Amer. Rockwell Corp., Canoga Park, California

This process is best defined as electrochemically controlled ion-exchange.

The objective of this effort is the development of a prototype cell with 100 sq. cm. electrodes.

Work at present is focused on the selection of the most suitable ion-exchange materials for this process. This is being accomplished by kinetic studies on weak acid, and weak base ion-exchange resins, a literature search, and consultation with manufacturer's representatives.

The research that must precede the design of a prototype cell involves the development of a reliable and reproducible test electrode followed by the optimization of electrode exchange characteristics with respect to: 1. Ratio of ingredients (e.g., Norit, graphite, binder, ion-exchange resin). 2. Current. 3. Potential. 4. Electrochemical capacity.

The purpose of the prototype cell study is to investigate scale-up factors such as current, capacity, ratio of times required for demineralization and regeneration, and response to ions in brackish water.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0040, DEVELOPMENT OF DIRECT CONTACT CONDENSATION MULTISTAGE FLASH (DCC-MSF) DISTILLATION PROCESS

R.D. KEEN, North Amer. Rockwell Corp., Canoga Park, California

The program consists of analytical and experimental studies aimed at evaluating the feasibility of the Atomic International Direct Contact Condensation - Multistage Flash (AI-DCC-MSF) Distillation Desalination Process for Saline Water Conversion.

The AI-DCC-MSF process differs from conventional MSF processes in that (1) flashed vapor is condensed by direct contact with flowing fresh water instead of by contact with metal tubes containing flowing brine, and (2) the brine is heated external to the flash chambers by indirect contact with the hot fresh water in a simple heat exchanger employing low cost plastic film heat transfer surfaces.

The principal effort under the current program consists of the design, fabrication, and initial operation of two test units to demonstrate (a) direct contact condensation heat transfer rates and (b) plastic film heat exchanger operating feasibility. The program also includes an analytical study of direct contact condensation for high velocity cross current flows of steam and water, and the evaluation of plastic films which are potentially useful for the brine-to-fresh water heat exchanger.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0041, NUCLEATION AND GROWTH OF ICE CRYSTALS

G.R. SCHNEIDER, North Amer. Rockwell Corp., Canoga Park, California

An experimental program is being conducted to investigate (a) the growth of ice crystals in ice-brine slurries for secondary refrigerant freeze desalination processes and (b) hydrate formation in secondary refrigerant processes, as a possible undesirable feature of the process.

A technique for counting and sizing ice particles is being developed and will be utilized to determine size distributions in ice slurries as a function of crystallizer operating variables. In addition, the effect of natural organic contaminants and crystal habit modifiers present in sea water on the particle size distribution of ice will be assessed. The relative rates at which ice and hydrate crystals form in a secondary refrigerant process will also be investigated in order to determine techniques for minimizing hydrate formation.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0042, ROOT-KNOT NEMATODE CONTROL (MELOIDOGYNE NAASI-FRANKLIN)

M.W. ALLEN, Univ. of California, School of Agriculture, Davis, California 95616

Research on the control of the root-knot nematode *Meloidogyne neasi* Franklin, 1965. The study will involve the use of various nematocidal chemicals at several dosage rates. Various crops will be grown to determine their effect upon nematode populations. Crops included are barley varieties (spring and winter), wheat (spring and winter), oats, alfalfa, peas, onion and potato. The effect upon nematode populations of fallow and fallow combined with deep plowing will be studied. Soil and root samples will be collected several times during the cropping season to determine the effect of treatments on the nematode population. Field studies will be supplemented by greenhouse investigation of host range, biology and pathogenicity.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0043, IMPURITIES OF IRRIGATION WATERS AFFECTING SOIL PROPERTIES

L.D. DONEEN, Univ. of California, Agricultural Experiment Sta., Davis, California 95616

Investigate effects of kinds and concentrations of salts on soil structure and penetration of irrigation waters into soil; effects on

plants of materials dissolved in irrigation waters, degree of accumulation of harmful salines in the soil as affected by kinds and concentrations of salts in the water, soil conditions, climatic conditions, and practices of growers; study of the suitability of sewage effluents and drainage waters as irrigation waters.

Description of Work: Previous work has indicated that slightly soluble salts of Ca-MgHCO_3 and CaSO_4 in the irrigation water does not produce salines in the soil and, furthermore, the permeability of the soil is determined by the concentration of salt in the water, the sodium content, and the bicarbonate. To evaluate these many and interrelated components, 2 lysimeter studies are under way. One in the greenhouse includes 2 soils and 13 waters of varying quality. The other is a large outdoor installation employing 9 waters of varying quality from which yield can be obtained. These studies are concerned with infiltration rates, salt balance, leaching requirements for chloride and bicarbonate waters and their effect on soil properties.

Miscible displacement is being investigated. This is fundamental to understanding the simultaneous solute and fluid transfer processes. Both velocity and diffusional mixing are important, as well as the media itself, in determining the distribution of the solute.

3.0044, SALINITY AND ION TRANSPORT MECHANISMS OF PLANT CELL MEMBRANES

E. EPSTEIN, Univ. of California, School of Agriculture, Davis, California 95616

1. According to many reports recently summarized (Nature 212:1324-27, 1966) selective absorption of mineral ions by plant cells is effected through dual mechanisms which differ in many characteristics. It is planned to compare this dual pattern in conventional, i.e., salt-sensitive species and in 'halophytes', plants which are native to saline habitats.

2. The location of the two mechanisms of ion transport will be investigated. There is agreement that the first of these mechanisms is located in the external cytoplasmic membrane, the plasmalemma. The location of the second mechanism, however, is problematical.

3. The connection between ion transport and metabolism will be investigated. Experiments will be done with photosynthetic tissue in the light and in the dark, and the results compared with those of experiments of non-photosynthetic tissue.

4. Experiments will be done on binding of ions to plant cell components. These experiments are meant to supplement those dealing with rates of absorption.

5. Experiments will be done to correlate findings on ion transport with those on salt toleration in salt-tolerant and salt-sensitive species. Attempts will be made to establish whether salt damage to plant cells involves an initial damage to their membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0045, POTENTIAL USEFULNESS OF ANTITRANSPIRANTS FOR INCREASING WATER USE EFFICIENCY OF PLANTS

R.M. HAGAN, Univ. of California, School of Agriculture, Davis, California 95616

Numerous efforts have been made over the past decade to reduce evaporation from water surfaces, but there has been relatively little research on methods for decreasing the transpirational loss of waters from plant leaves. Less than 1% of the water absorbed by plant roots is retained within the plant.

This project has the following objectives: 1. Continue evaluation of new antitranspirant materials (e.g., semipermeable films, reflectants and metabolic inhibitors) for phytotoxicity and their effects on transpiration, relative turgidity, leaf temperature, net photosynthesis and growth. 2. Determine relative permeabilities of film antitranspirants to water vapor, carbon dioxide and oxygen. 3. Study plant and environmental factors which may influence the effects of antitranspirants on transpiration, relative turgidity, and plant growth processes. 4. Develop techniques for supplying antitranspirants and for evaluating the completeness of

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

their coverage on plant leaves, their stability and specific effects on stomatal movement. 5. Investigate the potential usefulness of various combinations of antitranspirant materials as a means of increasing the water-use efficiency of plants. 6. Study special uses of antitranspirants in agriculture, ornamental horticulture, and watershed management.

Full use will be made of basic biochemical research on stomatal regulators by Dr. I. Zelitch and associates at New Haven, Connecticut and on external films by Dr. J. Gale at Jerusalem, Israel. Water use will be assessed by meteorological instrumentation, soil moisture studies, and lysometric techniques. Other observations may include stomatal measurements, relative turgidity of leaves, cell sap concentration, and diurnal measurements of tree trunk radius as indications of internal water stress. Field experiments will be conducted to determine effects of antitranspirant materials on water use efficiency of crops and also on their growth, yield and quality.

3.0049, FOLIAR PENETRATION OF CHEMICALS WHICH INCREASE DROUGHT AND SALT TOLERANCE

R.M. SACHS, Univ. of California, School of Agriculture, Davis, California 95616

Plant growth retardants have decreased water requirements of some species but the response is highly variable under field conditions. The reduction in water use appears to be linked to the reduced vegetative growth. The major factor accounting for variable response is penetration of the chemical. Two foliar applied growth retardants, Alar and MH, are most effective when applied shortly after bud break. Studies with C14 labelled materials show that penetration is greatest through the youngest leaves, such as those appearing shortly after bud break. Surfactant-induced and alcohol-induced enhancement of penetration has been demonstrated. The alcohol (isopropyl, ethyl, or methyl) effect appears to be the result of better wetting of the leaf surfaces and not due to solvent action on the cuticular surface.

SUPPORTED BY University of California

3.0050, DEVELOPMENT OF REVERSE OSMOSIS MEMBRANES

S. MANJIKIAN, Univ. Water Corporation, Del Mar, California 92014 (14-01-0001-2093)

The objective of research undertaken under this contract is to develop new and improved membranes from casting formulations based on cellulose esters. It is proposed to investigate various cellulose esters, specially cellulose acetate butyrate, in a variety of casting solution formulations. These formulations will include various solvents, flux promoters, coupling agents and plasticizers. The effect of pyridine, monohydroxy fatty acids and alcohols as possible couplers in cellulosic solutions will be investigated. Fabrication procedures will be studied to develop optimum methods for fabricating membranes from new formulations.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0051, DESIGN AND CONSTRUCTION OF A REVERSE OSMOSIS PILOT PLANT FOR THE DESALINATION OF SEA WATER

S. MANJIKIAN, Univ. Water Corporation, Del Mar, California 92014

The purpose of this contract is: to design and construct a 2,500 gpd tubular sea water reverse osmosis unit based on pyridine membranes; to test operate the pilot plant with sea water in order to establish the performance characteristics of the unit at various conditions; and to establish optimum economic mode of operation. The program will be conducted in two phases which are, generally: the pilot plant design and construction, and the pilot plant evaluation.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0052, EVALUATION OF DESALINATION PROPERTIES OF CELLULOSE ACETATE MEMBRANES IN FLAT, TUBULAR AND SPIRAL WOUND CONFIGURATIONS

S. MANJIKIAN, Univ. Water Corporation, Del Mar, California 92014

The purpose of this contract is to evaluate the effects of physical stress or strain to which cellulose acetate membranes may be subjected in fabrication or operation; and to determine how these effects are influenced by casting solution composition, conditions imposed during casting and fabrication of the membranes, and the configuration in which the membrane is operated. Laboratory and bench scale tests will be conducted to determine the comparative effects on membrane performance when operated in the flat, tubular and spiral module configurations. Membranes for testing in these configurations will be varied ac-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

according to the type of casting solution and the methods for fabricating the membranes. The test program will include: membrane formulation; membrane fabrication; and testing.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0053, OPTIMIZATION STUDY OF HIGH RECOVERY REVERSE OSMOSIS PLANTS

S.T. BRAUNHEIM, Aerojet General Corporation, *El Monte, California* 91734

The chief objective of this program is to develop an optimum economic reverse osmosis process scheme for maximum product recovery and minimum brine disposal. A mathematical model and an optimized plant system to predict product water cost at product water recoveries ranging from 50 to 98 percent will be developed. Based on this model, detailed cost estimates for desalting four typical brackish waters in the 10 mgd plant size will be prepared. Specific tasks in this contract include process studies, optimization studies, and analysis and presentation.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0054, REVERSE OSMOSIS MEMBRANE REGENERATION

P.A. CANTOR, Aerojet General Corporation, *El Monte, California* 91734

The purpose of this contract is to develop novel methods of extending the economical service life of currently available acetate reverse osmosis membranes. These techniques will cause state-of-the-art systems employing current membranes to become much more economically competitive, and will also effect similar cost savings upon more economical future systems. Through several modifications and the evaluation of these modifications' technical and economic feasibility, recreation of the new membrane structure may be adopted as a standard practice in reverse osmosis plants to maintain high water flux in the membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0055, DEVELOPMENT OF A CALIBRATION MODULE FOR TRACE OXYGEN ANALYZERS

H.C. EDGINGTON, Aerojet General Corporation, *El Monte, California* 91734

The program encompasses research and development to produce a prototype calibration module. The purpose of this module would be to provide a stream of water having an accurately known dissolved concentration for calibration of dissolved oxygen analyzers in the parts per billion concentration level.

Laboratory tests will be conducted to study techniques for use in the Dissolved Oxygen Calibrator. Experimental setups will be used to evaluate de-oxygenation of the sample stream. Tests will be conducted to evaluate gas equilibration and direct injection for the production of accurately known dissolved oxygen concentrations. Gas mixing and coulometric (electrical) generation will be examined as approaches for preparation of gas mixtures for equilibration studies. Coulometric generation will also be investigated as a means for production of measured quantities of oxygen for direct injection as a gas or solution. Concurrently a screening review will be made of candidate analytical methods that can be used to verify the accuracy of the dissolved oxygen levels produced by the calibration module.

Following the above research, a prototype calibration module will be designed and fabricated. Finally, the operating characteristics of the prototype model will be determined.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0056, REVERSE OSMOSIS PILOT PLANT INVESTIGATIONS

G.A. FLUKE, Aerojet General Corporation, *El Monte, California* 91734

The objectives of this program are to develop engineering and plant operation data to improve the economics of plate and frame design reverse osmosis systems, and to establish the

desalination properties of newly developed high salt retention membranes. The various investigations to be conducted include pretreatment studies, evaluation of a 14-inch diameter reverse osmosis unit, membrane substrate evaluation, baffle system evaluation, and the field evaluation of high retention membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0057, PROCESS AND CONFIGURATION DEVELOPMENT FOR TUBULAR REVERSE OSMOSIS UNITS

G.A. FLUKE, Aerojet General Corporation, *El Monte, California* 91734

The chief objective of this program is to develop an economical tubular design reverse osmosis system for brackish water desalination. Major emphasis will be placed on (1) engineering and parametric studies to optimize process and plant design parameters, (2) design and development of tube header and feed and product water manifold system, and (3) material selection and development of manufacturing techniques to produce reverse osmosis tubular elements on a continuous basis in an automated assembly shop.

Within the scope of work there are three planned phases: Plant Design Optimization Studies, Component Development, and Construction and Evaluation of the 1000 gpd Pilot Plant (based on the first two phases).

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0058, DEVELOPMENT OF STORAGE TECHNIQUES FOR REVERSE OSMOSIS MEMBRANES

R.W. LAWRENCE, Aerojet General Corporation, *El Monte, California* 91734

The objective of this program is to develop a workable system for the protection of membranes, membrane assemblies and whole reverse osmosis units against the effects of exposure to microorganisms and other potentially deleterious environmental conditions. Efforts will be made to generalize the procedures developed in order that they may be applied to any reverse osmosis system employing cellulose acetate membranes.

The following developmental tasks are included in the contract: I - Biocide and Biostat Solution, II - Low-Temperature Exposure, III - Dry Membrane Systems, IV - Shipping and Storage Procedures, and V - Standard Shipping and Storage Procedures.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0059, PRELIMINARY EVALUATION OF HIGH RETENTION MEMBRANES

E.R. ROBERTS, Aerojet General Corporation, *El Monte, California* 91734

The purpose of this contract is to evaluate the performance of high retention reverse osmosis membranes on sea water under field conditions. Work to be achieved under this contract includes refitting the 14-inch reverse osmosis cell, setting up sea water pretreatment facilities, installing the cell assembly, relocating the trailer to the San Diego Saline Facility, and making the necessary calculation on and analyzations of the data required.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0060, DEVELOPMENT OF NEW AND IMPROVED CELLULOSE ESTER REVERSE OSMOSIS MEMBRANES

C.W. SALTONSTALL, Aerojet General Corporation, *El Monte, California* 91734

This research project is to develop new and improved cellulose ester membranes for the desalination of sea water in one pass by reverse osmosis. Major emphasis is to be placed on improving the compaction resistance of current cellulose acetate membranes so that an average flux of no less than 10 gallons per square foot per day of a product water containing 500 ppm or less of salt can be obtained from sea water in 50% recovery. This is to be achieved by continuous use of the membrane in a one-stage reverse osmosis process.

The program is to include the development of new and improved cellulose ester polymer blend membranes; the develop-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

ment of homopolymer mixed ester membranes based on E 398-3; development of homopolymer mixed ester membranes based on E 360-60; development of crosslinked membranes derived from E 398-3, E 398-10, and E 360-60. These membranes will then be biostabilized and basic and analytical studies will be conducted.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0061, OPERATION AND EVALUATION OF A 50,000 GALLONS PER DAY REVERSE OSMOSIS PILOT PLANT *E.R. WATSON, Aerojet General Corporation, El Monte, California 91734*

This contract was undertaken to establish the capability of the pilot plant to operate over long periods of time virtually unattended. This does not include attention as to preventative maintenance of periodic surveillance for purposes of inspection and data gathering.

Proposed tasks for the plate and frame reverse osmosis plant operation and evaluation include: 1. Making a continuous test run utilizing the feed water pretreatment method and specific equipment. 2. Analyzing samples for the various constituents 3. Closely monitoring the operation of the pilot plant by means of the acquired data. 4. Keeping a detailed operating log on the plant during the test period. 5. Establishing the effect of changes in operating variables. 6. Preparing cost estimates (capital and operating for 1 and 10 mgd capacity) plate and frame reverse osmosis brackish water desalting plants. 7. Preparing a final report.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0062, WATER YIELD IMPROVEMENT IN THE BRUSHLANDS OF THE SOUTHWEST *L.F. DEBANO, U.S. Dept. of Agriculture, Pac. Sw. For. & Rg. Expt. Sta., Glendora, California*

Object: To establish fundamental plant, soil and water relations as they influence water losses and yields and to develop cultural practices for improving water yield in bushlands.

Plan of Work: Research activities are directed toward studying soil moisture movement in bushland soils. The staff is evaluating unsaturated flow rates during infiltration, evaporation, and other capillary movement through wettable and nonwettable soils, in laboratory and field studies. They are conducting studies comparing consumptive use of brush and grass. Investigations will be made of lateral flow in steep brushlands.

SUPPORTED BY U.S. Dept. of Agriculture

3.0063, NATURAL RECHARGE OF GROUND WATER IN CENTRAL AND SOUTHERN CALIFORNIA *R.B. HICKOK, U.S. Dept. of Agriculture, Lompoc, California*

Objective: Prediction of ground water recharge by direct rainfall penetration and absorption of runoff.

Plan of Work: Trace movement of infiltrated rainfall and runoff abstractions through upland soils and valley fill materials, relating amounts penetrating beyond root zones to climate and watershed conditions.

SUPPORTED BY U.S. Dept. of Agriculture

3.0064, ENGINEERING SERVICES - 50-150 MM GALLON PER DAY MULTISTAGE, MULTIFLASH DESALINATION PROCESS *F.J. DONNELLY, Fluor Corporation, Los Angeles, California 90022*

Act as technical representative for the Office of Saline Water to review engineering, design, drawings, specifications and schedules for a 50-150 MM gallon per day multistage, multiflash desalination process. Work includes investigations pertaining to desalting technology as follows: 1. Process optimization considering brine concentration, tubeside brine velocity, brine blowdown temperature, stage lengths, fouling factors, heat transfer coefficients, flow distributions and stage equalization. 2. Study part load operation, including economic studies, as influenced by number of pumps, isolating valves, use of variable orifices and brine velocities. 3. Evaluate materials. 4. Study use of multistage

versus single stage vertical centrifugal pumps and wet pit versus dry pit applications. 5. Monitor and consult with OSW on a simulation program now under development. 6. Study alternative non-condensable gas removal systems as they relate to operation, maintenance and compatibility with power plant requirements. 7. Evaluate technology for application to large desalting plants including decarbonation techniques, flash chamber performance and test module operating results.

3.0065, THE EFFECT OF ORGANIC INHIBITORS ON THE DISSOLUTION KINETICS OF IRON *K. NOBE, Univ. of California, School of Engineering, Los Angeles - U.C.L.A., California 90024*

This research program is for investigation of the inhibition of iron corrosion by organic compounds and for study of the mechanism of this inhibition in the absence and presence of chloride ions. Pertinent electrochemical parameters will be examined for pure and impure iron electrodes in both inhibited and uninhibited systems. The corrosion data obtained will be compared with the behavior predicted by recently developed theories. The investigation can be expected to result in a greater fundamental understanding of metallic corrosion and further insight into the mechanism of corrosion inhibition.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0066, GEL SEPARATION PROCESSES FOR SALINE SOLUTIONS *R.L. PECSOK, Univ. of California, Graduate School, Los Angeles - U.C.L.A., California 90024*

In this study we will attempt to identify and define quantitatively the various mechanisms operating on the separation of simple ions and small molecules on existing gels. The approach to the elucidation of the mechanism will be a comparison of partition coefficients of various ions and compounds determined under special conditions. For example, variation of solute size and gel cross-linking will indicate the extent of the geometrical effect, while variations in flow rate will indicate the extent of restricted diffusion. Finally variation of ionic strength of the eluent, concentration of the solute, temperature, and degree and type of fixed charges in the network will indicate the degree of the various ionic mechanisms: ion exchange, ion retardation, and ion exclusion. Whatever the mechanism(s), new gels will then be synthesized which will enhance the exclusion of small ions. Hopefully then, sodium chloride will be excluded from the new gel material just as cobalt and nickel tris-ethylenediamine salts are excluded from Sephadex G-10.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0067, POTENTIAL APPLICATIONS OF NUCLEAR EXPLOSIVES IN WATER RESOURCE DEVELOPMENT *A.M. PIPER, U.S. Dept. of Interior, Water Resources Division, Menlo Park, California*

At the request of the Atomic Energy Commission, the project seeks to delineate the hydrologic situations in which nuclear explosives might be used to advantage, and limitations on such use including potentially hazardous side effects. Three phases of study are contemplated: (1) Delineate physical, and hydrologic principles; (2) Identify type areas and sites, both within and beyond the United States, that match limiting specifications for an advantageous use of nuclear explosive. For certain of these, appraise potential hydrologic advantage and disadvantage in relation to legal, economic, and other non-hydrologic limitations; (3) Hopefully and ultimately to identify a site or sites suitable for demonstrating principles by a test detonation or detonations.

SUPPORTED BY U.S. Dept. of Interior - Geological Survey

3.0068, RESEARCH ON POROUS GLASS MEMBRANES FOR REVERSE OSMOSIS *G.A. GUTER, McDonnell Douglas Corporation, Newport Beach, California*

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The objectives of this research are to conduct exploratory studies entailing the characterization and assessment of the potential of various porous hollow glass filaments for use in the desalination and purification of brackish and other contaminated waters by the reverse osmosis process. Special hollow glass filaments will be prepared having a composition containing SiO_2 - B_2O_3 - K_2O and SiO_2 - B_2O_3 - Li_2O . Other materials such as calcium, strontium and barium will be added to modify the silica network. The fabrication of porous glass involving heat treatment, leaching, washing and partial firing will be modified to determine the optimum conditions for obtaining good reverse osmosis membranes. These membranes will be tested with sodium chloride solutions ranging in composition from 1000 ppm to 15,000 ppm. Pressures of 600 and 1500 psi will be used in the reverse osmosis experiments. Other studies using porous glass membranes will be conducted to test their use in the purification of space cabin waste water. Based upon these results, a demonstration unit capability of purifying the water for one man per day will be designed, fabricated and tested.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0069, 14-01-0001-1760 -- IN-SITU FORMATION OF REGENERATIVE CELLULOSE ACETATE MEMBRANES ON POROUS SUPPORTS

G.A. GUTER, McDonnell Douglas Corporation, Newport Beach, California

The objective of this program is to develop regenerative cast membranes with performance equivalent to films cast by other procedures. Membranes will be coated on ceramic and other porous tubes with varying casting solution compositions and procedures. Films will be made by alternately coating the tubes in casting solution, repeating this procedure until the desired film thickness is built-up, and finally the film will be cured in water by the standard procedure. Casting and testing apparently will be developed for evaluation of films produced on 9' long tubes. Commercially available ceramic tubes will be used for outside surface coating, and 1' diameter porous pipe will be used for inside surface coating. Films prepared in the above manner will be tested at 600 psi with 3000 ppm sodium chloride feed. Based on the data obtained from this study, a conceptual design for a 50,000 GPD regenerable membrane reverse osmosis unit will be developed.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0070, REVERSE OSMOSIS TUBULAR MODULE OPTIMIZATION

W. BAERG, Philco Ford Corporation, Newport Beach, California

a. Derive mathematical expressions relating the design and operating variables pertinent to reverse osmosis tubular module optimization. Using reasonable approximations, develop simplified solutions to find the most important variables and their ranges of greater interest. b. Carry out more exact machine computations of optimum design and operating conditions on a variety of cases of practical interest, i.e., for selected feed conditions, plant capacities, and membrane performance characteristics, agreed upon with the Government Project Monitor. c. Obtain experimental data on various tubular membranes (e.g., characterized by a range of heating temperatures and casting solution formulations) of salt rejection and product water flux for a range of values of the operating pressure and temperature, feed composition, and flow velocity. d. Integrate the results obtained in (c) with the computations of (b) to provide a set of practical design data for scaleup to an appropriate pilot plant scale in concurrence with the Government Project Monitor.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0071, DETERMINATION OF THE SURFACE AND COLLOIDAL CONDITIONS WHICH CAN LEAD TO HIGH SALT REJECTION REVERSE OSMOSIS POLYMER MEMBRANES

R.E. KESTING, Philco Ford Corporation, Newport Beach, California

The ultimate goal of the program is to improve the economics of the Reverse Osmosis Process by developing membranes which will exhibit a higher product flux for a given degree of permselectivity. A unified surface and colloidal chemical approach is being utilized to this end. In the surface chemistry portion of the program, the nature of the quasi liquid membranes which form spontaneously as a result of the surfactant capacities of certain feed additives and which act in series with Reverse Osmosis membranes to increase the latter's salt retention is being investigated. In the colloidal chemistry section, correlations are being sought between isotropy (as determined by light scattering measurements) in the polymer solutions from which membranes are made and the performance characteristics of the membranes themselves. The basic a priori postulate is that gel isotropy (in a plane parallel to the membrane surface) is attributable to and preceded by sol isotropy. Thus the 'equivalent pore size' distribution may hopefully be lowered and salt retention increased by controlling sol isotropy.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0072, BRACKISH WATER FIELD TEST EVALUATION OF MEMBRANE PROCESSES

L.P. CARPENTER, Henry J. Kaiser Company, Oakland, California 94103

This contract was proposed to evaluate the desalting efficiency and economics of the membrane-based desalination processes and/or plant designs on a selected number of natural brackish waters under actual field service conditions. Results will be used to establish the economic potential of each candidate process and/or plant design being evaluated from scale-up to commercial application. Included in the study will be field evaluation testing of four membrane desalting pilot plants by using alternate pretreatment systems on a number of representative natural brackish waters at the Mobile Test Facility. The work will be accomplished in three phases which are: the design of the Mobile Test Facility; the preparation of this facility; and finally, field evaluation testing.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0073, PARAMETRIC ECONOMIC AND ENGINEERING STUDY OF THE REVERSE OSMOSIS PROCESS

V.S. IVINS, Westinghouse Electric Corp., Orange, California

The objective of this contract is to conduct a comparative engineering and economic evaluation of present technology reverse osmosis reference plant designs such as plate and frame, spiral, tubular and hollow fine fiber. Based on the results of this study, detailed capital and annual operating cost estimates for each reference plant design with capacities of 1, 10, and 50 mgd will be developed. Critical components, materials and design parameters for each design which contribute significantly to product water costs will be identified. Those areas associated with each critical parameter which have high probability for improvement with additional research and development will be specified. The second set of cost estimates for each design and plant size studied is to be based on projected technology membrane costs, membrane flux rates and life characteristics.

3.0074, THREE BASIC PROBLEMS IN FLUID MECHANICS: EVAPORATIVE CONVECTION, ELECTRO-OSMOSIS, INTERNAL WAVES

A. ACRIVOS, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

Evaporative Convection: A central problem here is the determination of the detailed structure of the convective flow. We have already shown experimentally, using schlieren photography, that these flow patterns belong generally to one of four categories depending on the depth of the liquid layer, the evaporation rate, and on whether the convection is driven by buoyancy or surface tension. The experimental investigations, which are continuing, will be supplemented by a numerical analysis of the equation of change using a high speed computer, for the purpose of develop-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

ing a theoretical model for this important phenomenon. Special attention will be focused on the role played by surface active agents and on whether their ability to dampen the overall convection is related in any way to their propensity to suppress evaporation.

Electro-osmosis: The purpose of this new research program is to study how the presence of an electro-osmotic motion near a solid interface will affect the rate of mass transfer to such a surface.

Internal Waves: Here we propose to investigate various classes of flows, such as internal waves, that owe their very existence to the presence of density gradients inside the fluid such as those existing for example in various parts of the oceans.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0075, TRANSPORT PHENOMENA IN FUSED ORGANIC SALTS

J.E. LIND, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305 (14-01-0001-1683)

The basic question to be answered is how do the coulombic forces in a dense fluid affect the structure and the transport properties of the fluid. The answer to this question may be relevant to the understanding of interfaces of high concentration as in reverse osmosis. The viscosity and diffusion coefficients of salts with identical isoelectronic anions and cations are being compared with fluids of uncharged molecules which are isoelectronic to the salt ions. Their thermodynamic and transport properties are measured under pressure and the salt properties are compared with those of the nonelectrolyte at the same volume and temperature. These measurements permit comparison with statistical mechanical models and thus a structural interpretation is possible. The systems of interest are tetra-alkylammonium tetra-alkylborate salts and their hydrocarbon analogues.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0076, A STUDY OF THE HYDROLOGIC EFFECTS OF RAINFALL AUGMENTATION

R.K. LINSLEY, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

It is proposed to use a water-shed model, which effectively simulates the behavior of watersheds on a digital computer, as a basis for evaluating the probable hydrologic effects of rainfall augmentation for watersheds typical of several regions of the country. With this model it is planned to assess the available reservoir storage, flood peaks, soil moisture, actual evapotranspiration, and possibly suspended sediment production.

Specifically it is proposed that six watersheds be selected as representative of typical climatological and hydrologic regimes of the United States. Each watershed will be modeled; that is, necessary parameters for hydrologic model will be determined by a study of actual records. Actual rainfall over a period of thirty years will be fed into the computer as input, with appropriate instructions to increase the observed amounts to simulate rainfall augmentation by 5, 10, and 15 per cent. The outputs in the form of evapotranspiration, soil moisture, stream flow, flood peak frequency, sediment yield, and other factors will then be computed for the thirty year period and compared with the actual occurrences to determine the possible effect of rainfall increase. In addition to presenting the effects as calculated for each watershed, generalizations will be made so that the data may be used to estimate probable effects of seeding on other watersheds. In addition to answering many of the hydrologic questions regarding the effect of rainfall increase on streamflow, soil moisture, etc. the proposed analysis should provide information which could be of value to meteorologists and biologists in considering other side effects of rainfall augmentation.

3.0077, OPTIMAL DESALINATION BY GEOMETRIC PROGRAMMING AND MATHEMATICAL DECOMPOSITION

D.J. WILDE, Stanford University, School of Engineering, Palo Alto - Stanford, California 94305

Certain novel optimization methods, which may be particularly suitable for desalination systems, will be investigated. One method is geometric programming, an elegant body of theory which not only can solve nonlinear optimization problems of the sort arising in desalination technology, but also can generate design rules for adapting desalination systems to changing economic and technological conditions. The other deals with decomposition principles for exploiting the structure of systems of weakly interacting components, not only to find the system optimum, but also to study the sensitivity of this optimum to uncertainty in cost estimates, design specifications, and performance of the components.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0078, MINIMUM WATER SANITARY SYSTEM

C. HOFFMAN, U.S. Navy, Civil Engineering Lab., Port Hueneme - Point Mugu, California

Technical Objective: Investigate new concepts for the collection treatment and disposal of waste water in polar camps, and develop systems and components which are convenient to use, simple and inexpensive to operate, and which minimize pollution of the polar environment.

Approach: Develop and evaluate toilet units requiring little or no fresh water for flushing and investigate economic and sanitary methods and systems for the disposal of collected waste.

Progress: May 1966 through December 1966. A mechanical flush chemical toilet was developed. The unique feature of this unit is simplicity, other significant features include low cost, reliable sanitary operation, odor control and minimum water usage. Pollution control studies indicate that a control incinerator servicing all waste centers would provide an effective means of pollution control. Studies are continuing on the feasibility of using synthetic nonfreezing waste-carriage media. A literature review is being made to collect data on threat to health of polar camp personnel posed by viruses in human waste. N L Drobny, Mechanical-flush chemical toilet, tech rpt R-471, Aug 66.

3.0079, TEST OPERATION OF A 2,500 GPD TWO-STAGE SEA WATER REVERSE OSMOSIS PILOT PLANT

J.S. WILLIAMS, U.S. Navy, Civil Engineering Lab., Port Hueneme - Point Mugu, California

The purpose of this program is to establish optimum operating conditions and economics of sea water desalination in a two-stage tubular reverse osmosis system. Through test operation on a natural sea water, the design integrity of the tubular design pilot plant and its components will be determined. The effective service life of the newly developed pyridine based cellulose acetate membrane for sea water desalination application will also be determined as well as the optimum pretreatment methods, operating conditions and desalting costs of sea water desalination in a two-stage tubular reverse osmosis system.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0080, A STUDY OF THE EFFECTS OF SURFACE POTENTIAL ON SCALE FORMATION

B.D. MARCUS, TRW Incorporated, Redondo Beach, California

This program is a continuation of one recently carried out under Contract No. 14-01-0001-646. In that effort it was shown that radioisotope techniques (in particular, autoradiography) were powerful tools in monitoring the early stages of scale formation on metal surfaces. Using such techniques, it was demonstrated that control of the electrical potential of the surface could substantially alter the rate of formation of calcium sulfate scale on platinum surfaces in supersaturated solutions. This was a significant finding in that it may be feasible to utilize this phenomenon to control the formation of scale in desalination equipment.

The purpose of the current program is to examine this phenomenon in detail as a function of system parameters such as temperature, concentration, pH, etc. In addition, efforts will be made to relate the observed behavior to the fundamental mechanisms of scale nucleation and growth. In particular, it is suspected that heterogeneous nucleation of scale involves an adsorption step which can be influenced by the surface potential.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0081, SEPHTON FLASH TUBE (VORTEX TUBE) PROCESS

H.H. SEPHTON, Univ. of California, School of Engineering, Richmond, California 94804

The objective of this project is to evaluate a novel method of fluid flow control as applied to a falling film of evaporating saline water and its vapor flowing through vertical distillation tubes with the purpose of enhancing heat flux through the wall of such tubes. This flow control is effected by imposing a continuous vortex upon the fluid in the tubes by a helical baffle inserted therein.

A vertical tube evaporator (VTE) test facility was constructed providing for the simultaneous comparative testing of pairs of vertical distillation tubes. Each pair is tested, one as a vortex tube with helical insert against the other as a reference tube without insert. Tube types and sizes are identical with those used in large plant operation and process conditions are controlled within limits determined by actual or proposed large VTE plant operation.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0082, MULTICOMPONENT FIXED-BED ION EXCHANGE IN THE TREATMENT OF SALINE WATER

T. VERMEULEN, Univ. of California, School of Engineering, Richmond, California 94804

In the continuing study of rate-limited column performance, the general expression for mass transfer within any rate-controlled phase (developed recently in this program) will be used to interpret experimental studies of H-Na-Ag and H-Ca-Mg systems with Duolite C-25 and Dowex 50W resins under separate conditions where pore diffusion, solid-diffusion, or external-mass-transfer control will be considered. Mathematical study of the column for ternary (and perhaps higher) systems will also be continued.

Numerous proposals to remove salt from saline waters by means of ion exchange accompanied by chemical reaction or phase change have been made in recent years. It is planned that specific systems of potential practical interest will be calculated by multicomponent equilibrium theory and an experimental verification of the results will be made.

Regenerant level, concentration, flow rates, number and arrangement of columns, and other variables usually controlling dynamic column performance affect the economic design of multicyclic fixed-bed operation. Pending objectives of the present study are the elaboration of a binary design method and its extension of multicomponent operation.

3.0083, PRINCIPLES AND PRACTICES FOR SALINITY CONTROL IN THE SOIL-WATER-PLANT SYSTEM

C.A. BOWER, U.S. Dept. of Agriculture, Riverside, California

Objectives: Develop principles, formulas, and practices (1) to ameliorate and prevent accumulations of salts and exchangeable sodium in soils, and (2) to minimize the adverse effects of accumulations on plants and soils.

Plan of Work: Use theory, instruments, lysimeters, models and field studies to determine drainage conditions and requirements and to develop improved drainage designs and materials in relation to soil and water properties, boundary conditions, irrigation methods and crops. Determine most efficient and economical means of leaching salts and replacing exchangeable sodium by applying waters and amendments in various ways and amounts to soil in laboratory columns, lysimeters and field plots. By field and laboratory studies develop tillage, and soil, water and crop management practices to improve soil permeability and tilth. In lysimeters and field plots determine leaching requirements for sustained high crop yields in relation to salinity of irrigation water, salt tolerance of crops, depth to water table and irrigation practices. Using field plots, devise special land-forming, planting and irrigation practices for minimizing adverse effects of salts and exchangeable sodium on plants.

U.S. Dept. of Agriculture

3.0084, WATER QUALITY, AND THE CHEMISTRY, MINERALOGY AND BIOLOGY OF SALTAFFECTED SOILS

C.A. BOWER, U.S. Dept. of Agriculture, Riverside, California

Objective: Determine the relations between dissolved, adsorbed and precipitated soil salts, the effect of soil composition and water quality upon these relations, and the effect of salt distribution on the physical and chemical properties of soils.

Plan of Work: Determine equilibrium relations between dissolved, adsorbed and precipitated soil constituents. Monitor effluent composition from laboratory soil columns, and determine steady-state and transient concentrations within the columns. Determine the effects of solution composition and soil additives on soil physical and chemical properties, relating differences obtained to soil composition wherever possible. Extend laboratory results to the greenhouse and field, to test applicability in a dynamic system. Develop general principles for predicting the above phenomena, and integrate these principles into a satisfactory theory for predicting irrigation water suitability and effects under a wide range of conditions. Apply these principles to data obtained from irrigation projects, to assess their general applicability, the potential for reuse of water, and the extent to which satisfactory salt balance can be achieved.

3.0085, RELATION OF SALINITY TO STATE AND TRANSPORT OF WATER AND IONS IN SOIL AND PLANTS

C.A. BOWER, U.S. Dept. of Agriculture, Riverside, California

Objective: Develop a quantitative understanding of transport and energy status of water and ions in the soil-plant-atmosphere continuum as affected by the physical environment.

Plan of Work: Develop and improve techniques for in situ measurement of the components of the water potential in soil and plants. Determine the extent of the interdependence of the osmotic and matrix components of the water potential. Characterize the environment of plant roots with respect to ions and energy level of water. Relate uptake of ions and water by roots to their respective concentrations and energy levels at the root. Formulate, test, and improve mathematical and physical models for prediction of transport of water and ions through plants as influenced by root geometry, distribution of water and ions in the soil as functions of time and depth, magnitude and distribution among components of plant water potential, and vapor concentration gradient at the leaf surfaces.

SUPPORTED BY U.S. Dept. of Agriculture

3.0086, SOILS AND NUTRIENT CULTURE EXPERIMENTS TO DETERMINE THE EFFECTS OF VARIABLE SALINITY CONDITIONS ON CITRUS BEHAVIOR

F.T. BINGHAM, Univ. of California, Agricultural Experiment Sta., Riverside, California 92502

Study salinity tolerance of citrus under field conditions where variable salinity conditions are built up in soil from use of irrigation waters of different quality; measure behavior of citrus trees with respect to yield, size, and quality under varying patterns of salinity with respect to vertical distribution in profile and chemical characteristics; use same rootstock top combination and under same climatic conditions set up in solution cultures with graded salinity contents with salinity same through root zone but salinity varying from point to point in soil profile.

DESCRIPTION OF WORK - Field studies at Riverside are underway using Valencia trees budded on Troyer rootstock. Four treatments are to include: (1) water of excellent quality, (2) water of the ionic composition of Colorado River water, (3) water synthesized to approximate twice the ionic composition of Colorado River water, and (4) water synthesized to approximate 220 ppm Cl, low SO₄, and give a 50-50 Na-Ca ratio. Trees are basined and each treatment includes 20 individual tree replicates. Solution culture studies designed to approximate soil solution concentrations in the field are planned.

3.0087, BORON CHARACTERISTICS AND RECLAMATION NEEDS OF SOILS IN WESTERN KERN COUNTY
F.T. BINGHAM, Univ. of California, Agricultural Experiment Sta., *Riverside, California 92502*

Objectives are three-fold: 1. To characterize mineralogically and chemically, selected soils from Kern County representing significant acreages in need of reclamation. 2. To obtain detailed information of certain soil reactions that bear upon reclamation (boron desorption, cation exchange, salt movement, and water flow). 3. To test, under laboratory conditions, various reclamation techniques.

The project entails selection of representative samples from the field taken in conjunction with a semi-detailed soil survey and taking samples to the laboratory for detailed study.

SUPPORTED BY California State Government

3.0088, THE EFFECTS OF FLUORIDES IN AIR, WATER AND SOIL ON GROWTH, QUALITY AND YIELDS OF TREE, FIELD AND VEGETABLE CROPS
R.F. BREWER, Univ. of California, Agricultural Experiment Sta., *Riverside, California 92502*

Objectives: 1. Determine effects of F accumulation on plant growth, crop yields and product quality. 2. Determine interrelationship between F and other plant constituents such as Ca, P, Zn, Mn, and Al. 3. Investigate the feasibility of protecting F-sensitive crops from F-polluted air by modification of cultural practices. 4. Study the physical and chemical effects of F-containing irrigation waters on western soils.

Description of Work Proposed: Test plants will be exposed to known concentrations of HF in the air or will be sprayed with dilute NaF or HF sprays to study effects on growth, yields, fruit quality and nutrient content. Calcium sprays will be applied to greenhouse and field plants exposed to F to determine feasibility of obtaining protection. Western soils irrigated with F-containing waters will be examined for physical and chemical changes.

3.0089, INCREASING CHAPARRAL WATERSHED YIELD THROUGH IMPROVED USE OF PHENOXY-TYPE HERBICIDES
J.R. GOODIN, Univ. of California, School of Agriculture, *Riverside, California 92502*

This project studies the influence of environment on the translocation of herbicides in resprouting chaparral species. Specifically, soil moisture, soil and ambient temperature, light, and humidity will be investigated in an attempt to find the correct combination of environmental factors which will lead to the greatest chance for success in causing a growth-regulating chemical to be translocated into the crown region. The following will be employed:

1. Labelled and unlabelled phenoxy-type herbicides will be used to study the rate and degree of absorption and translocation as influenced by soil moisture stress. 2. Other environmental factors such as air and soil temperature, relative humidity, and light will be investigated with respect to their influence on translocation of herbicides.

Laboratory data achieved under precisely controlled conditions will be correlated with field data obtained in this project and in WRC Project No. W121-5U-69.

3.0090, COOPERATIVE RESEARCH ON SOIL AND WATER MANAGEMENT OF DRY-FARM GRAINLAND AND RELATED LANDS
R.E. LUEBS, Univ. of California, Agricultural Experiment Sta., *Riverside, California 92502*

Objective: To develop effective soil and water management practices for conserving soil and water, and particularly to improve the efficiency of moisture use in a dry, mild winter climate.

Description of work proposed: The following studies involving field, laboratory, and greenhouse experiments are proposed: (1) Measuring evaporative moisture losses from different soils during the rainless summer to evaluate fallow; (2) comparing several feasible tillage systems for their effect on moisture storage with fallow; (3) measuring moisture use efficiency for forage and grain crops under the prevailing low and erratic rainfall; and (4) determining optimum nitrogen availability for different levels of available moisture and for different methods of plant residue management.

3.0091, SURFACE AND SUBSURFACE IRRIGATION SYSTEMS FOR COASTAL CALIFORNIA
P. NIXON, Univ. of California, Agricultural Experiment Sta., *Riverside, California 92502*

Objective: To develop methods and practices for irrigation of field and row crops and provide maximum efficiency of water used with a minimum buildup of saline elements.

Plan of Work: Continue collection of inflow-outflow of water, nutrient, and salt balance on 1000-acre citrus crop watershed. Continue replicated presalinized field plot, research on irrigation of potatoes to maintain high productivity and favorable salt balance. Conduct field and laboratory tests of materials and devices for subirrigation of tree and row crops. Develop methods for installing and removing subirrigation systems. Conduct laboratory and field tests of saturated and unsaturated flow of moisture away from the subsurface irrigation system. Design optimum location of subirrigation device with respect to crop type and root zone.

3.0092, WATER USE UNDER DRYLAND CONDITIONS IN COASTAL VALLEYS OF CALIFORNIA
W.F. SPENCER, Univ. of California, Agricultural Experiment Sta., *Riverside, California 92502*

Objective: To develop principles and practices for more efficient and effective use of precipitation on crop and rangelands in the coastal valleys of California.

Plan of Work: Field, laboratory, and greenhouse experiments will be conducted to determine proper cropping systems, sequences, cultural practices, fertilization, and combinations thereof necessary for maximum moisture utilization, optimum crop productivity, and maintenance of soil productivity. The work includes studies of climatic factors affecting water use, factors affecting infiltration, storage of water in soil, evaporation from the surface, the effect of concentrating rainfall, the interrelationships between timing of nitrogen fertilization and moisture availability in relation to stage of plant growth. In field trials different fertilizer rates will be applied to forage and grain crops, yields, quality of product, leaf area, root development, moisture use, and various climatic factors will be measured. The technique of adding soil moisture is used to secure better control of the moisture variable and lysimeters are used to more accurately estimate evapotranspiration.

3.0095, DEVELOPMENT AND TESTING OF LARGE, SPIRAL-WOUND, MULTI-LEAF REVERSE OSMOSIS MODULES

T.J. LARSON, General Dynamics Corporation, *San Diego, California*

This contract is comprised of four main tasks. The first is to conduct a detailed evaluation of backing materials in order to arrive at an acceptable material selection for large modules. Each materials' cost and availability will be considered as well as its performance. In the second task, modifications to the internal module configuration will be evaluated in an effort to arrive at an acceptable design for large modules. Construction and the testing of experimental modules will be undertaken as required to assist in the evaluation of the various problem areas. Phase III includes conducting detailed evaluation of materials handling problems, configuration, support requirements; and the fabrication and testing of modules to establish an acceptable rolling technique for large modules. The last task is to carry out detailed tests on selected modules for the evaluation of various assembly methods.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0096, RESEARCH ON IMPROVED REVERSE OSMOSIS MEMBRANES

H.K. LONSDALE, General Dynamics Corporation, *San Diego, California*

This research is directed toward the characterization of modified (Loeb-Sourirajan type) cellulose acetate membranes and the development of ultrathin film-composite membranes for desalination by the reverse osmosis process. The properties of modified membranes to be examined are membrane compaction and useful life, and imperfections which lead to reduced semipermeability. Techniques are being sought for the preparation of ultrathin films (2000 Angstrom units thick) of cellulose acetates and a crosslinked polyvinylpyrrolidone system, and of suitable porous support membranes for these films, and of methods for incorporating thin films and porous supports into composite membranes with reverse osmosis properties superior to those of the modified membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0097, STUDY OF REJECTION OF VARIOUS SOLUTES BY REVERSE OSMOSIS MEMBRANES

H.K. LONSDALE, General Dynamics Corporation, *San Diego, California*

The purpose of this research is to measure the selectivity of well-characterized cellulose acetate reverse osmosis membrane of the Loeb-Sourirajan type to a number of inorganic and organic solutes of importance to water quality. The intrinsic permeability of cellulose acetate to these solutes will be measured by means of a sorption experiment and the solute rejection will be measured in reverse osmosis tests under conditions that will allow the results to be extrapolated to other experimental conditions. Among the solutes of interest are ammonium, nitrate, bicarbonate, and phosphate salts, boric acid, a simple sugar, a chlorinated hydrocarbon, and urea. Methods for improving the rejection of some of these species will also be examined.

3.0099, APPLICATION OF IRON-ALUMINUM BASE ALLOYS TO SALINE WATER CONVERSION

C.E. SMELTZER, Internat. Harvester Co., *San Diego, California* (14-01-0001-1796)

In the flash-evaporator type of saline water converter, the cost of tubing becomes an important consideration. For reasons of low cost and ready availability, the ferrous alloys are being given serious consideration for these applications.

Alloys of iron and aluminum, made up of two of the most abundant elements in the earth's crust, should be of great interest from the viewpoint of economics. The Alfenol (Fe-Al) and Thermenol (Fe-Al-Mo) series exhibit stainless qualities and, in general, good corrosion resistance in various media. For example, the corrosion resistance of Thermenol is superior to both types 302 and 430 stainless steels in a 20 percent sodium chloride solution at 194 degrees F.

Purpose of this program is to systematically study the sea water corrosion properties of Alfenol and Thermenol type alloys, and to determine the effect of decreasing aluminum contents upon the overall corrosion resistance of these alloy systems. Hopefully, it will be possible to decrease substantially the aluminum content of these alloys, thereby greatly improving their ductility and still retain a sufficient degree of resistance to the corrosive sea water environment.

3.0100, BOUNDARY LAYER FLOW PROBLEMS IN DESALINATION BY REVERSE OSMOSIS

F.A. WILLIAMS, Univ. of California, School of Engineering, *San Diego - La Jolla, California* 92038

Theoretical and experimental research is being carried out on the reverse-osmosis method of water desalination. The discipline of the study is fluid dynamics. Velocity fields and salt concentration fields will be calculated theoretically and measured experimentally in a variety of flows which exhibit boundary-layer characteristics and which involve mass transfer through seim-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

permeable membrane walls. The membranes that will be employed will be those commonly used in reverse-osmosis devices for a water desalination. The geometries to be investigated first are steady laminar flow over a semiinfinite (semipermeable) flat plate and fully developed laminar flow in a two-dimensional channel with a semipermeable wall. The results of the research are expected to improve the accuracy of knowledge of osmotic properties of existing semipermeable barriers, to provide information concerning the onset of crystallization, and to clarify generally the process of salt buildup during reverse osmosis.

3.0102, THE ELECTROSORB PROCESS FOR DESALTING WATER

A.M. JOHNSON, Marquardt Corporation, Van Nuys, California 91409 (14-01-0001-1444)

Porous carbon electrode systems that display water desalting capability are under investigation. An understanding of the mechanism whereby such systems function is important for the attainment of the highest desalting performance that is consistent with long-term electrode durability. Mechanistic evidence that is presently available suggests the dominance of purely capacitive factors; but it is known that the responsiveness of a particular electrode to ions of one charge sign is dependent to an important extent upon the chemistry of the electrode's preparation. A theoretical model that appears to illuminate the behavior of known electrode-electrolyte systems is being developed with the aid of experimental tests.

The test program entails investigation of multivariable operating regimes, preparation and testing of novel electrode materials, and design construction and application of new test equipment. Feedwaters range from aqueous sodium chloride to simulated natural brackish waters.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0103, THE THERMOSORB PROCESS FOR DESALTING WATER

A.M. JOHNSON, Marquardt Corporation, Van Nuys, California 91409 (14-01-0001-1469)

A bed of suitably prepared porous carbons will sorb salt from low-temperature feedwater; introduction of hot feedwater then causes salt desorption. Practical sorbent beds in a works-scale unit are expected to operate between temperatures of about 200 and 800°C, permitting the use of low-cost heat. The functioning of a thermally modulated, carbon sorbent, desalting process is based upon the coupling of capacitive and ion-exchanging phenomena via the electron conductivity of the carbon sorbent matrix. Sorbent preparation and testing in progress is aimed toward the development of the most efficacious and durable salt sorbents that can be economically produced. As work progresses it is expected that system design will be initiated.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0104, THE ELECTROSORB PROCESS FOR DESALTING WATER

A.M. JOHNSON, Marquardt Corporation, Van Nuys, California 91409

Electrode systems based upon porous carbon are being investigated for desalting water. It is believed that the fundamental phenomena of desalting by these electrodes are those associated with capacitive charging of the extensive wetted surfaces supplied by the carbon. It is assumed that this behavior can be predicted from a knowledge of charge-versus-voltage function of a given surface for ionic species of interest, and that the nature of this function can be modified by suitable chemical pretreatment. Thus electrodes can be prepared especially for cation or for anion responsiveness. A theoretical model of these systems is being developed, analyzed, and compared with experimental results.

The test program includes preparation and testing of suitable electrode systems in terms of the theoretical model as well as in terms of performance level and of durability in the presence of various important ionic species. It also includes studies of variously pretreated carbons to determine their capacitive ion sorption characteristics. Design and performance optimization studies are planned to evaluate the potential of these systems for practical desalting applications.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0105, LIME MAGNESIUM CARBONATE PROCESS - SEA WATER SOFTENING PLANT

D.D. KAYS, Stearns Roger Corporation, Denver, Colorado 80204

Stearns-Roger has developed the system design and constructed a prototype facility competent to carry out research and development of the Lime-Magnesium Carbonate Process for pretreating sea water fed to evaporators. The plant has the capacity of treating approximately 3 MGD of sea water.

This pretreatment is a method of reducing the quantity of calcium present in the feed, thus reducing the solubility product and raising the temperature at which solid CaSO_4 can form. In addition, bicarbonate can be removed, resulting in the precipitation of CaCO_3 . This has the potential of eliminating the present need for acidification. This modified sea water will then be suitable for evaporation at higher temperatures and, at the same time, less corrosion.

The prototype facility will provide process criteria for specifying and sizing of the clarifiers, reactors, and other equipment required for various size desalting plants.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0106, INVESTIGATIONS OF ALGAE INHIBITING MATERIALS

T.R. BARTLEY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Attached aquatic organisms seriously reduce the carrying capacity of irrigation and water distribution structures. Laboratory and field studies show that by coating these structures with appropriate materials containing toxicants the organisms will not develop on the coated area. Coatings under study include antifouling paints, direct metal coatings to concentrate incorporation of toxicants in the concrete surface, and various other materials applied to the surface of the submerged concrete. The most promising results to date indicate that certain antifouling paints, a vinyl-resin system cuprous oxide or tributyl tin oxide, applied to submerged concrete will provide long-term inhibition of algae attachment. The present program has progressed sufficiently to provide recommendations for routine field use of specified materials on submerged concrete structures. These antifouling coatings are presently limited to small areas, such as concrete weirs and flumes, because of cost.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0107, AROMATIC SOLVENT AQUATIC HERBICIDES AND EMULSIFYING AGENT TESTING

T.R. BARTLEY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Certain aromatic hydrocarbon solvents are used extensively by the Bureau of Reclamation and cooperating irrigation districts for controlling submersed aquatic weeds. These materials are seldom available in quantity as formulated aquatic herbicides, but

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

are often products of petroleum or coal-tar distillations that differ in makeup. Large-scale acquisition of these byproducts requires laboratory testing and evaluation for determining suitability as aquatic herbicides. Studies have shown that aromatic solvents must have specific physical and chemical properties, as well as proper dispersion in irrigation water by emulsifiers. Physical, chemical, and biological laboratory tests are conducted on samples of aromatic solvent materials and emulsifying compounds to determine whether they meet specifications and are effective as aquatic weed herbicides. These samples are submitted to the laboratory from Bureau field offices, manufacturers, and suppliers.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0108, EFFECT OF COPPER SULFATE ON AQUATIC WEEDS

T.R. BARTLEY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Laboratory studies and experiments by other investigators have shown that copper has a pronounced effect on higher forms of aquatic vegetation. Copper has been used for many years as an effective algicide. This study was undertaken to determine the effects of a semicontinuous feed of low concentrations of copper on the growth of aquatic weeds common to Western irrigation canals.

Small copper sulfate crystals are fed into the flowing water at a calculated rate based on water volume by means of an automatic feeding device equipped with a timer. The copper sulfate is fed into the water daily throughout most of the irrigation season. The aquatic weed growth will be observed frequently through the season to determine the effect of the treatment. Concentration of copper in the irrigation water will be monitored. Total alkalinity of water on copper concentrations is being investigated. Water temperature and other factors are investigated in this aquatic weed control study.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0109, HERBICIDE RESIDUES

T.R. BARTLEY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

It is important to know the level of herbicide that gets into irrigation water either through direct application to the water or through applications adjacent to the water. The amount of herbicide that accumulates in the aquatic plants and the aquatic and agricultural soils is also pertinent to a better understand and use of the weed control method being practiced.

Samples of water and sometimes aquatic plants, aquatic soils, and agricultural soils exposed to herbicide treatments are collected in and along irrigation canals for analysis of various herbicides commonly used for weed control on irrigation projects.

Herbicides such as 2,4-D, 2,4,5-T, xylene and acrolein copper, are being emphasized in this study. The level of herbicide present in samples will be measured through the use of gas chromatographic and atomic absorption spectrophotometric techniques.

3.0110, SOLAR REFLECTANCE OF MONOLAYER-COVERED WATER SURFACES AS RELATED TO EVAPORATION SUPPRESSION

J.T. BEARD, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

A study is being made to determine the chemical substances which will substantially increase the solar reflectance of monolayer-covered water surfaces. The study includes determining the optical properties of these substances in the monolayer form. Known values for optical properties are limited to substances in the bulk form. Two basic categories of substances are under investigation: (1) Dyes, which by their general nature have a high coefficient of absorption in the visible energy wave lengths where most solar energy is found; and (2) polymers, wherein an increase in film thickness tends to increase the reflectance of films having certain optical properties.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0111, WEED CONTROL AND REVEGETATION

C.L. DAVENPORT, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Work on the Rio Grande Project, Las Cruces Branch, New Mexico, consists of weed control demonstration on project right-of-way to ascertain most economical and effective means of controlling perennial grasses, woody plants and weeds to establish a permanent cover crop of adaptable grasses.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0112, SURFACE FACILITIES FOR DISPOSAL OF DESALTING PLANT EFFLUENTS

L.M. ELLSPERMAN, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Objectives: To develop design criteria for surface facilities to be used in the disposal of desalting plant effluents.

Description of Work: a. Perform 'state of the art' bibliography, including literature and industry survey. b. Explore and evaluate soil samples from probable sites. c. Conduct a laboratory evaluation of the effectiveness of soil sealants and other lining materials with various brine effluents. d. Develop a monitoring system for continuous and routine measurements of seepage losses. f. Field test soil sealants and other lining materials and develop optimum methods of application. g. Prepare a manual on surface facilities for disposal of desalting plant effluents. h. Conduct an economic study of salt disposal.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0113, CONSUMPTIVE USE OF WATER BY SALT CEDARS

R. FIFE, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Work being done on the Middle Rio Grande Project, near Bernardo, New Mexico, consists of three sets of lysimeters, each set consisting of three tanks, to be located in a representative area of salt cedars. One set, having a high water table, will be used as a control. The second set will be used to determine the effect of the rapid lowering of the water table. The third set will be located in a cleared area.

The purpose of the study is to (1) determine the change in consumptive use of salt cedars after the depth of groundwater has been rapidly increased; (2) determine the difference in consumptive use of water between cleared and uncleared areas; (3) to obtain data for comparison of consumptive use rates as determined for other areas and to appraise the validity of transferring such data to other areas.

During F. Y. 1965 routine operation and maintenance of the nine large and five small evapotranspirimeters continued. Two vegetative density surveys were made of the salt cedar in the tanks and in the surrounding area. The tanks were flushed during November, but it was not necessary to add gypsum.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0114, RADIO METHODS FOR DETERMINING WATER VAPOR CONTENT OF AIR

Q.L. FLOREY, U.S. Dept. of Interior, Evaporation Reduction Section, Denver, Colorado 80225

Study is a joint effort by the Environmental Science Services Administration and the Bureau of Reclamation in connection with the Lake Hefner field studies made during 1965, 1966 and 1967. The Lake Hefner tests, which were designed to permit a comparison of several methods for determining evaporation losses and savings through the use of monomolecular films, also provides an ideal opportunity to measure the refraction of radio waves resulting from water vapor in the air and may result in a simple method for evaluating monomolecular films on large water surfaces.

The bulk aerodynamic and energy budget methods require extensive instrumentation and personnel and are indirect, empirical methods for estimating the evaporation in terms of other measurable parameters such as vapor pressure gradient, wind speed,

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

and radiation balance. Results to date have been restricted to averages over periods of days to weeks. The study involves measurement of turbulent flux of water vapor both directly at a point and indirectly by the apparent variation of radio path length over distances of the order of several miles and comparing the indicated evaporation losses with those indicated by the various other methods to be utilized.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0115, PROGRAM FOR FIELD EVALUATION OF REVERSE OSMOSIS PILOT PLANTS ON BRACKISH WATERS

D.H. FURUKAWA, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The objectives of this work are: to test operate reverse osmosis pilot plants on natural brackish waters at Roswell, New Mexico, and Dalpra Farm, Colorado, and to determine their operational characteristics; to obtain comparative data on the desalination performance characteristics of these units; to establish optimum operating conditions and pretreatment requirements for economic desalting of Roswell type brackish waters.

The scope of work will include: test operate pilot plants with blended brackish waters of 2,000 to 4,000 ppm at Roswell and 3,700 ppm at Dalpra Farm; establish optimum operating conditions, optimum feed water pretreatment requirements, and active service life of reverse osmosis membranes; conduct economic study and compare cost of desalting test brackish waters by different designs.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0116, PROGRAM FOR ELECTRODIALYSIS RESEARCH AND DEVELOPMENT

D.H. FURUKAWA, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The objectives of this work are: to establish long term effects on process characteristics and components for high temperature electrodialysis; to perform comparative evaluation tests on different neutral membranes using Dalpra Farm water supply as test water and commercial electrodialysis stacks as test vehicles.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0117, COMPARATIVE EVALUATION OF REVERSE OSMOSIS PILOT PLANTS OF DIFFERENT DESIGN CONFIGURATIONS

D.H. FURUKAWA, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The objective of this work is to obtain data on the design and performance characteristics of plate and frame, spiral, and tubular reverse osmosis systems through the test operation of 1,000 gpd pilot plant units on synthetic brackish waters under different test conditions. Based on test data, the design (or designs) will be identified that offers the most promise for immediate advancement to commercial application. Areas will be recommended where additional research and engineering efforts are needed to improve component reliability and performance capability of each design tested.

The general requirements of the work to be performed under the contract are as follows: 1. Operate pilot plants on synthetic waters under a preselected set of operating conditions and salinities. 2. Investigate the effect of changes in feed water salinity, feed water pH, and product to feed water ratio on the process efficiency and design integrity. 3. Investigate practical hydrodynamic methods of minimizing concentration polarization effects at the solution-membrane interface for each reverse osmosis unit design. 4. Develop standard test procedures to determine the performance characteristics of reverse osmosis membranes. 5. Identify potential areas where additional research and engineering efforts are likely to produce information helpful in lowering the cost of desalting brackish waters by reverse osmosis process. 6. Train the maintenance and operation contractor personnel to continue this test program in the OSW brackish water test center facility at Roswell, New Mexico. 7. Prepare a final report on results. With recommendations for further study.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0118, WEED CONTROL AND REVEGETATION

C. GUERRO, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Work on the Middle Rio Grande Project, New Mexico, consists of weed control demonstration on project right-of-way and river lands to ascertain the most economical and effective means of controlling woody plants. The funds for establishment of grasses for permanent vegetative cover have been applied to the control of woody plants.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0119, WEED CONTROL AND REVEGETATION

A.L. HULBERT, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Work on the Rio Grande Project, Ysleta Branch, Texas, consists of weed control demonstration on project distribution and drain right-of-way to ascertain the most economical and effective means of controlling perennial grasses and weeds to establish a permanent cover crop of adaptable grasses.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0120, HYDRAULIC MODEL STUDIES OF A PUMP INLET MANIFOLD

D.L. KING, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Because of the variable flow rates in the manifolds of flash distillation plants and the fact that the vapor pressure of the brine is near the flash point, there is a critical need for maintaining the design net positive suction head on the circulating pump and for eliminating vapor entraining vortices at the pump inlet.

A pump inlet system design has been verified by model tests to assure that design conditions for the pump suction will be met. The objective of the studies was to verify or, if necessary, to modify the design of the module inlet system so that it will be essentially free of vortex formation and excessive drawdown of the water surface.

Flow conditions in the evaporation channels immediately upstream from the manifold have also been investigated. The model is being retained to investigate any problems which might arise during operation of the prototype module.

Investigations to determine the head losses in the inter-module piping were completed.

3.0121, CONTROL OF WOODY PLANTS

W.D. LEIGON, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Work is being done on the Rio Grande Project, Caballo Reservoir, near Truth or Consequences, New Mexico. During the past years, a portion of this area has been aerial sprayed to determine the effectiveness of herbicides on woody plants when small volume applications are made. A new phase of program recently initiated with the State of New Mexico provides for removal of woody plants and control by various methods and root food reserve studies.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0122, VALUE OF DESALTED WATER FOR IRRIGATION

J. MALETIC, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225 (14-01-0001-1241)*

The technical objectives of this study are to make preliminary evaluation of the benefits that would accrue from using desalted water, at various quality levels, to augment and improve the water supply of three selected irrigated areas and to select a method for introducing desalted water into the existing irrigation systems of these areas. With the information noted above, the Office of Saline Water will be able to identify the design and operating criteria and the limiting economic constraints for desalting plants to be used for the application cited.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0123, SELECTION OF SITES FOR FIELD TESTING BRACKISH WATER CONVERSION UNITS

H.R. MCDONALD, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The objective of this work is to recommend sites for field testing brackish water conversion units, evaluate their suitability, and provide support services as requested. The Bureau of Reclamation will investigate, evaluate, and recommend sites suitable for conducting field operational tests of brackish water conversion units. Preference will be given to sites owned by or accessible to agencies of the Department of the Interior, in particular, the Federal Water Pollution Control Administration and the Bureau of Reclamation.

The test site should be available for a period of one or more years and should be of a size suitable for testing up to three brackish water conversion units simultaneously for purposes of comparison and to concentrate the need for support services to a few sites at a time. Reclamation has recommended a number of sites from which the required number will be selected by the Office of Saline Water as needed.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0124, BASIC INVESTIGATION OF HEAT AND MOISTURE TRANSFER ACROSS THE AIR-WATER INTERFACE

T.R. MEE, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

A laboratory study is being made of the heat and moisture transfer across the air-water interface. Particular attention is being given to the structure of the interface; the laminar layers above and below the surface; the modes of heat and mass transfer; and the nature of the physical and chemical parameters which govern the rate of mass transfer. An empirical model is being developed which will describe the physical process of water evaporation and the effects that air water temperature differences, wind and wave action, and laminar region thickness have on the process.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0125, FIELD INVESTIGATION OF THE SUBMERSED AQUATIC ENVIRONMENT

N.E. OTTO, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Study of the ecological relationships of plants and animals in canal and reservoir environments are necessary to gain understanding of biological problems existing in these areas. Knowledge of environmental factors and interactions are essential to future improvement of aquatic weed and animal problems existing in irrigation distribution systems. Data have been collected from irrigation canals in three different geographical areas concerning the physical, chemical, and general biological aspects. Samples of soil, water, and biological materials are being collected for chemical and physical analyses in both weed-free and heavily infested canal sites. Observations are being made of all physical, chemical, and biological factors suspected as being important in the environment. Data obtained to date indicate that rooted submersed aquatic weeds are adapted to a wide range of environmental conditions, and no one specific set of factors nor interaction of factors has been demonstrated as being responsible for pondweed invasion and establishment in a canal system. Present emphasis on this phase of the aquatic pest investigations program is associated with more detailed study of the nutrient requirement of submersed aquatic weeds, including filamentous green algae.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0126, FIELD EVALUATION OF SOIL-APPLIED HERBICIDE FOR TOTAL VEGETATION CONTROL

N.E. OTTO, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Twenty-two different soil-applied herbicide formulations are being evaluated for ability to provide complete control of vegetation. The initial herbicides under test were applied to replicated 1-square-rod plots at three different rates.

The study will be conducted for a minimum of 5 years on the original field test site. Data obtained will provide information useful to field operation personnel for improving non-selective herbicide applications and long-term vegetation control on areas where plant cover is undesirable. Evidence at the end of 4 years indicates that three of the newer formulations of herbicides are exhibiting more efficient vegetation control than most types presently under general use by the Bureau of Reclamation.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0127, LABORATORY STUDY OF AQUATIC ENVIRONMENTAL FACTORS AND PLANT GROWTH STAGES ON AQUATIC WEED GROWTH AND HERBICIDAL RESPONSE

N.E. OTTO, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

The effectiveness of aquatic herbicides often varies in the same canal system. The factors responsible for these variations in herbicidal response are seldom determined, but might be ascribed to variations in environment or plant material. Laboratory studies are being conducted to evaluate environmental factors, such as light, temperature, and plant growth stage on the development of aquatic weeds and response to herbicidal treatment. Laboratory studies are conducted in two controlled environmental growth chambers. Results show that controlled environmental variations of light and temperature exert considerable influence on the growth and development of two pondweed species studied. These studies also show that the morphological growth stage (relative age) attained by aquatic plants was a major determinant in the degree of injury obtained from treatment with two types of aquatic herbicides. Studies are conducted on a continuing basis as new aquatic herbicides and weed control techniques become available.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0128, VALUE OF DESALTED WATER FOR IRRIGATION

H.L. PARKINSON, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

Three irrigated study areas, located near Yuma, Arizona, Phoenix, Arizona, and Thermal, California, are being studied at reconnaissance level to determine the value of various water quality levels for irrigation. Improved water quality would be achieved by desalting brackish water in the 2000-5000 ppm range. Water quality levels of 400, 900, and 1500 ppm are being studied. Desalting costs are being developed for both Electrodialysis and Multistage Flash methods. Efforts are being made to maximize the possible benefits. Soil salinity is being held at optimal ranges for maximum production of selected crops by utilizing an adequate amount of deep percolation. Crops enterprise budgets are being used to evaluate potential direct benefits. Crop selection is carefully done to assure the best net income at each water quality level. Crops vary some between study areas.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0129, A STUDY OF NATURAL EVAPORATION FROM FREE WATER SURFACES

R. PILIE, U.S. Dept. of Interior, Bureau of Reclamation, *Denver, Colorado 80225*

A laboratory and field investigation is being conducted to determine the quantitative relationship between wave characteristics, airflow characteristics, and evaporation rate. The microphysical processes that control the rate of mass transport across the water surface and how these processes change with wave activity particularly as influenced by monomolecular films, will also be studied. Field tests at Lake Hefner, Oklahoma will be conducted to develop methods of applying laboratory results to field situations.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0130, EVAPORATION REDUCTION INVESTIGATIONS STUDY OF THE EFFECTS OF FATTY ALCOHOLS ON THE ECOLOGY OF LAKE HEFNER

J.K. SILVEY, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

A study is being made to determine the effects of fatty alcohols on the ecology, especially the bacteria and plankton population, of Lake Hefner.

Evaporation Reduction investigations utilizing various monolayer-forming fatty alcohol mixtures conducted at Lake Hefner during the summer and fall months of 1965, 1966, and 1967 provide an ideal opportunity to observe these effects, since records on bacteria and plankton populations under natural conditions are available for several years prior to the monolayer applications.

3.0131, GREENHOUSE AND OUTDOOR NURSERY CULTURE OF SALT CEDAR PLANTS TO BE USED IN PHREATOPHYTE CONTROL PROGRAM

P.M. TURNER, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Plants for herbicide testing purposes are cultured in a greenhouse. Stem cuttings are used as propagating material. Saltcedars are also grown in a nursery and are used for field-type studies of phreatophyte control methods.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0132, HERBICIDE EVALUATION FOR PHREATOPHYTE CONTROL

P.M. TURNER, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Phreatophytes cover 16 million acres along water courses in the 17 Western States and may consume 20 to 25 acre-feet of water annually. Economical methods of control, primarily chemical, have been the object of investigations. Systemic herbicides are applied by foliar spraying to salt cedar plants at different rates. Effects of replicated

Herbicide treatment results will be correlated between indoor grown plants. The effects of adjuvants such as thickeners, surface active and emulsifying agents are evaluated for enhancement of herbicidal activity. Environmental factors of precipitation, relative humidity, air temperature, water table depth and soil composition are recorded and their effects on herbicide applications determined. The ecological aspects of saltcedar invasion of grassland following scouring and silt deposition resulting from flooding are being studied. The annual cycle of carbohydrate reserves have been determined by chemical analysis of root samples which have been collected in the field. This has been correlated with the response of plants to herbicides and other control methods. Combined methods of control such as mechanical mowing followed by herbicide treatments have been tested. The quality of water used for the herbicide spray diluent and its effects on treatments is being investigated. Soil application of herbicides has been evaluated.

SUPPORTED BY U.S. Dept. of Interior - Bu. Reclamation

3.0133, MICROBIOLOGICAL INVESTIGATIONS

P.M. TURNER, U.S. Dept. of Interior, Bureau of Reclamation, Denver, Colorado 80225

Microorganisms occurring in water supply, storage and conveyance systems cause problems such as corrosion, deposition, plugging and fouling. Investigations are made to identify the organisms, determine their mode of action and response to their environment, and to find effective measures of control.

3.0135, CONSTANT TOTAL PRESSURE EVAPORATION WITH HEART REUSE BY A BUILT-IN ENGINE

C. CHENG, Univ. of Denver, School of Engineering, Denver, Colorado 80210

In the process, an auxiliary system consisting of two organic substances which are partially miscible in a certain temperature range and have a critical solution temperature is used to serve as a built-in engine in an evaporating system to help separating fresh water from a brine. One substance is called a boiling point depressor and is added to the boiling mass to lower its boiling temperature, and the other is called an absorbent and is added to the condensing side to raise the temperature of the condensing mass. By the raising and lowering of the condensing and boiling temperatures respectively, heat of condensation can be effectively utilized in the evaporating of the boiling mass under a constant total pressure condition. The auxiliary system is regenerated by cooling below the critical solution temperature. A system consisting of a fluorocarbon as a depressor and a higher boiling paraffin hydrocarbon as an absorbent would be an ideal system owing to non-toxicity and low solubility in water.

The study will be directed primarily toward the screening of working mediums and determination of the necessary physical property data. Laboratory scale equipment will be constructed so that the feasibility of the process can be determined and the effects of heat and mass transfer can be evaluated.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0136, THE EFFECTS OF VELOCITY ON THE PASSIVATION OF ALLOYS IN BRACKISH WATER

D.T. KLODT, Univ. of Denver, Denver Research Institute, Denver, Colorado 80210

The primary objective of the proposed research program is to develop a basic understanding of the effects of velocity on passivity and corrosion resistance of alloys used in desalination plants. Another objective of the program is to provide engineering data on the corrosion resistance of eight commercially available alloys exposed to velocity conditions in brackish water. Environmental factors such as temperature, degree of aeration, concentration of the electrolyte, and the velocity of the electrolyte relative to the test metal surfaces will be similar to those that would be encountered in a typical process for desalting brackish water.

Analysis of the passivity will be conducted by electrochemical and electron microscopy techniques. The electrochemical, that is, potentiostatic measurements will be used to determine the overall or average passivity of the alloys. Electron microscopy studies of the structural and topographical characteristics of localized passivity breakdown will be correlated with the potentiostatic measurements. Thus, these analyses of passivity will be used to evaluate the basic behavior of the various alloys under velocity conditions. Also, the experimental techniques will be evaluated in terms of their potential usefulness in the development of new or modified corrosion resistant alloys in velocity exposure service.

3.0137, A STUDY OF THE STRESS-CORROSION SUSCEPTIBILITY OF CUPRO-NICKEL AND TITANIUM UNDER DESALINATION CONDITIONS

R.N. ORAVA, Univ. of Denver, Denver Research Institute, Denver, Colorado 80210

The objective of this research project is to establish the stress-corrosion susceptibility of titanium and cupro-nickel under conditions peculiar to desalination operations. The investigation is designed to provide the information necessary for the prediction of long-term stability from the standpoint of stress-corrosion behavior. Sheet and tube specimens of A-70 and A-40 grade commercial titanium, and 90Cu-10Ni, 70Cu-30Ni-0.5Fe copper-nickel alloys will be tested by continuous immersion in saline solutions. The specimen variables will be grain size and hardness temper, and the testing variables will be the applied stress on the specimen, and the composition, velocity, and temperature of the environment. The variation of stress will serve to establish a stress-failure time relationship. The solutions will be brackish water, and natural sea water with three different salt contents up to about 11 percent. Three velocities (0.4, 8 Fps.) and four temperatures will be examined (ambient, 150, 200, and about 250 degrees F).

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0138, EVAPORATION OF WATER AS RELATED TO WIND BARRIERS

J.E. CERMAK, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

The evaporation of water from soil and water surfaces and from plants is intimately associated with the local wind characteristics such as turbulence, mean velocity, temperature and water vapor content. Properly designed and located wind barriers and soil surface corrugations show considerable promise for controlling the local habitat with respect to turbulence and mean velocity or in other words the local transfer coefficients.

By means of experimental measurements over simulated corrugated surfaces with and without wind barriers placed in a special wind tunnel, an attempt will be made to attain the following objectives: 1. Determine the local heat and mass transfer coefficients over the surface of corrugated areas. The variation of these coefficients for a wide range of corrugation configuration, spacing, depth, and orientation relative to the mean wind direction is to be obtained. In addition to direct measurement of the transfer coefficients, the local mean wind distribution and turbulence characteristics are to be determined. 2. Determine the local heat and mass transfer coefficients over surfaces which are bordered by obstacles such as tree rows, hedge rows, stubble strips, and solid or semi-solid barriers. The variations of these coefficients for a variety of barrier structures, row spacing and height is to be obtained. Local mean wind distributions and turbulence characteristics are to be measured in addition to the local transfer coefficients. 3. Develop analytical methods, using the experimental data acquired, which will assist in the design of wind barriers for planning water conservation measures.

3.0141, FACILITIES, METHODS AND DESIGN CRITERIA TO PUMP, CONVEY, CONTROL AND MEASURE WATER FOR AGRICULTURAL PURPOSES IN THE NORTHERN PLAINS

H.R. HAISE, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: To develop and evaluate improved methods and facilities to increase efficiency and reduce labor requirements for pumping, conveying, controlling and measuring irrigation water; and to develop systems to handle runoff in areas of limited rainfall for more efficient crop production and storage of livestock and domestic water supplies.

Plan of Work: Investigations will be conducted in the laboratory and field. Particular attention will be given to automatic devices for distribution of irrigation water to border strips and furrows with the prime consideration being the more efficient use of water with reduced labor requirements. Structures that combine water control and water measurement adapted to on-farm conditions will be developed and evaluated to permit irrigation farmers to easily and accurately measure water at strategic points in their farm irrigation distribution system. New methods and materials for conveying water, such as flexible tubing and canal liners made of plastic and rubber, will be evaluated for adequacy, stability and adaptability. Field installations of water harvesting systems will be developed on non-irrigated lands to allow long-term evaluation of climatic vagrancies, cropping patterns, and economic feasibility. Another approach to be investigated involves concentration of runoff from small watersheds, usually marginal lands, and diverting such runoff into spreading systems or pans for more intensive crop production, or into storage reservoirs for livestock or domestic water supplies.

SUPPORTED BY U.S. Dept. of Agriculture

3.0142, IRRIGATION PRACTICES, REQUIREMENTS AND DESIGN CRITERIA FOR EFFICIENT USE OF WATER AND SUSTAINED CROP PRODUCTION IN THE NORTHERN PLAINS

H.R. HAISE, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: To determine proper timing of irrigation based upon stage of plant development and/or plant distress symptoms in relation to moisture availability, fertility status, plant density, etc., as affected by evapotranspiration processes; to develop and evaluate practical devices and procedures to estimate evapotranspiration and to develop and evaluate facilities, methods and design criteria for improved water application and distribution efficiency including hydraulics of flow in relation to stream size, and other factors for production of high quality crops.

Plan of Work: Studies will be made in the field, laboratory and greenhouse of (1) plant response to irrigation and related factors; (2) soil moisture availability on uptake and use of plant nutrients and related problems; (3) proper timing of irrigation;

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

(4) correlation of measured evapotranspiration for principal crops grown under various soil and climatic conditions; (5) developing more reliable methods of estimating evapotranspiration; (6) magnitude of influence of various climatic conditions on the evapotranspiration process and results considered when developing predictive equations; and (7) the fundamental relationships of stream size, slope, soil roughness, crop retardance, etc., affecting flow in surface irrigation systems. The combined crop and soil effects will be evaluated. Design procedures will be formulated.

3.0143, WATER YIELD IMPROVEMENT IN THE SNOW-PACK TIMBER ZONE, RUNOFF FROM RANGELANDS

M.D. HOOVER, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Plan of Work: The project staff will continue its investigation on (1) forest and snow relationships, specifically: different timber-cutting patterns on snow accumulation and melt and water yield, net radiation, soil moisture, and water vapor transport; (2) mountain range hydrology, specifically: the relation of grazing to water yield and sediment movement; and (3) reduction of erosion and damaging storm runoff. The latter phase is concerned with designing and testing gully control structures and the use of plants for erosion control.

SUPPORTED BY U.S. Dept. of Agriculture

3.0144, FLOW MEASUREMENT OF IRRIGATION WATER

H.J. KOLOSEUS, Colorado State University, Agricultural Experiment Sta., Fort Collins, Colorado 80521

Irrigation Flow Meters & Canal Structures - A. The general objective is to develop a new and improved device and techniques for the measurement of irrigation water. Specific problems include the following: Design and evaluation of trapezoidal measuring flumes. Determine the effect of convergence on the calibration of the Parshall Measuring Flume. Evaluate the vane-type flow meter.

DESCRIPTION OF WORK: The various measuring devices are tested in the hydraulics laboratory. The technique varies with each measuring device.

SUPPORTED BY Colorado State Government

3.0145, WATER YIELD AS RELATED TO CLIMATIC WATERSHED CHARACTERISTICS IN THE NORTHERN PLAINS

D.A. WOOLHISER, Colorado State University, School of Engineering, Fort Collins, Colorado 80521

Object: To identify the climatic and watershed factors influencing water yield from agricultural watersheds; to evaluate and integrate these factors quantitatively; to develop simple field procedures and 'working tools' by which the seasonal, annual and longer period yield of water from ungaged watersheds may be reliably estimated, and to develop methods by which ground water recharge and the yield of water from ground water may be estimated.

Plan of Work: The work is currently in progress on agricultural watersheds in the vicinity of Hastings, Nebraska; Newell and Cottonwood, South Dakota; and Ft. Collins, Colorado. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water evaluations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape and other geomorphic attributes of the watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

3.0146, WATER YIELD IMPROVEMENT, AND SNOW AND AVALANCHE PREDICTION AND PREVENTION, IN

THE ALPINE REGIONS OF THE CENTRAL ROCKY MOUNTAINS

M. MARTINELLI, U.S. Dept. of Agriculture, Rocky Mtn. For. & Rg. Ex. Sta., Fort Collins, Colorado

Object: To determine methods to increase snow storage in alpine snowfields; to control evaporation and melting; and to reduce snow avalanche danger by working out improved forecasting of hazard and methods of stabilizing snowpacks on mountain slopes.

Plan of work: In Snowfield research, the staff will continue to collect climatic data from alpine areas, and is testing varieties of snow fences. They are studying (1) snow accumulation and melt, (2) snow transport by wind, (3) the aerodynamics of mountain terrain, and (4) the use of chemicals to accelerate or retard snow-melt. Watersheds are being calibrated to test promising methods of alpine snowpack management. In Avalanche research, the staff is investigating European control methods for application to Rocky Mountain conditions. They are also determining the relationships between meteorological, terrain, and snowpack conditions and avalanche formation and movement.

SUPPORTED BY U.S. Dept. of Agriculture

3.0147, DEVELOPMENT OF WATER PURIFICATION SYSTEMS BASED ON REVERSE OSMOSIS

B. GITLOW, United Aircraft Corporation, Hartford - E. & W. Hartford, Connecticut

The performance of cellulose acetate reinforced membranes cast directly on nylon reinforcing cloth will be evaluated to determine rate at which water is purified in terms of gallons of water purified per square foot of active membrane area and the percent of salt rejection when the feed water concentration is 10,000 ppm and the flow conditions are turbulent. Some of the best performing membranes will be tested for extended periods of time to determine their potential for long life operation. Composite membranes applied to suitable support materials will also be fabricated and evaluated.

A small compact, disposable cartridge using composite membranes will be fabricated to demonstrate the feasibility and performance of such a cartridge.

Studies will be conducted to evaluate the design configurations which are feasible utilizing a reinforced membrane.

The performance of advanced reverse osmosis membranes will be evaluated; those membranes which demonstrate high levels of performance will be tested for extended periods of time.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0148, THE DESIGN, CONSTRUCTION AND TESTING OF A 10,000 GPD TRANSPORT DEPLETION DESALINATION PILOT PLANT

F. HARTER, United Aircraft Corporation, Hartford - E. & W. Hartford, Connecticut

A 10,000 gpd capacity transport depletion desalting pilot plant will be designed, constructed and receive laboratory evaluation. This will be accomplished by reviewing the available transport depletion data, identifying a series of design concepts, and constructing that concept which appears to offer the greatest potential. A brief laboratory evaluation of the pilot plant will be performed using synthetic brackish solutions.

Small experimental programs to define the properties of neutral and cation selective membranes, to more fully characterize the electrical performance of the transport depletion process using bench scale units, and to evaluate the hydrodynamic properties of transport depletion channels which incorporate various support screens will be performed.

Design specifications including cost estimates will be prepared for a 100,000 gpd capacity transport depletion test bed plant. A parametric cost analysis for commercial transport depletion plants of 1, 5 and 10 mgd capacity will also be performed.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0149, STUDY OF METHODS TO RETARD COMPACTION OF CELLULOSE ACETATE MEMBRANES IN REVERSE OSMOSIS DESALINATION

R.D. DEANIN, Debell & Richardson Inc., Hazardville, Connecticut 06036

Compaction of cellulose acetate membranes in desalination of water by reverse osmosis, appears similar to cold flow of plasticized cellulose acetate plastics. Of the techniques which reduce cold flow in plasticized cellulose acetate, those which appear compatible with use in reverse osmosis membranes have been selected for experimental study: increasing molecular weight, cross-linking, and reinforcement with fibers and pigments. These techniques will be applied first to solid films, then to asymmetric membranes used in reverse osmosis of saline water, to see whether they reduce cold flow, and whether they reduce compaction.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0150, DEVELOPMENT OF A 50,000 GALLON PER DAY NELLEN STACK ELECTRODIALYSIS MODULE

W.R. WILLIAMSON, Cuno Engineering Corporation, Meriden, Connecticut 06453

This contract is for the purpose of evaluating the technical and economic feasibility of the Nellen (flexible membrane) electrodialysis stack design in a 50,000 gallon per day module pilot plant. One module, 20-inches wide by 30-feet long, containing 75 membrane cell pairs will be designed, built and tested. Tests will be run on brackish water of 3,000 ppm total dissolved solids at internal liquid flow velocities from 2 to 10 centimeters per second. The cost of water from the Nellen type electrodialysis plants with capacities of 50,000 gpd, 200,000 and 400,000 gpd will be estimated.

3.0151, CONSERVING SOIL MOISTURE BENEATH RED PINE BY MEANS OF A FOLIAR SPRAY OF A STOMATA-CLOSING CHEMICAL

P.E. WAGGONER, Conn. Agric. Expt. Station, New Haven, Connecticut 06504

Objective: To ascertain whether a thorough foliar spray of phenylmercuric acetate conserves soil moisture beneath a stand of large red pine.

Procedure: Soil on 5 pairs of 50-foot plots will be covered with plastic. Thirty-foot red pine grow on plots. One lot of trees in each pair will be sprayed thoroughly with phenylmercuric acetate in 0.1% wetting agent. Seasonal change in soil moisture to a depth of 10 feet will be determined by neutron meter. A one-tenth saving in transpiration should create a significant 1 inch savings in the seasonal change.

SUPPORTED BY U.S. Dept. of Agriculture

3.0152, INTERFACIAL STRUCTURE AND TRANSPORT IN WATER

J.B. FENN, Yale University, School of Engineering, New Haven, Connecticut 06520

In a recent study we investigated the effect of monolayers on evaporative heat and mass transfer at water surfaces. We found that compressed films of cetyl alcohol, in addition to their evaporation suppression ability, also decreased natural convection in the water. This decrease might have resulted either from a change in the rheologic nature of the surface due to the presence of the film or from changes in the water properties over a distance of many molecules caused by the films. It could, of course, have been a result of both. The present study is an extension of this earlier work. We intend to take a closer look at surface structure and transport in water.

The use of oriented compressed monolayers as 'orientation promoters' on surfaces of pure water and various aqueous solutions seems to be a promising method for studies of structure and properties of water surfaces. If combined, for example, with

Brownian Motion studies it may be of great value in determining quantities such as surface viscosity, thermal gradients and the depth of the surface region. If combined with further evaporation studies and flow measurements, it can provide information on velocity or (in the case of solutions) concentration gradients near the surface.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0153, A STUDY OF THE BENEFITS OF PLASTIC MATERIALS IN DESALINATION PLANTS

D.R. GOODRICH, Amer. Cyanamid Company, Stamford, Connecticut

The goal of this investigation is to determine those areas where desalination costs can be minimized by replacing the current materials of construction with plastic or plastic-lined materials. The proposed method involves process analysis of existing desalination plants, collection of plastics data, computerized searching of candidate materials to meet materials requirements, and cost analysis. The four processes under consideration are: Electrodialysis, Reverse Osmosis, Distillation (M.S.F. and L.T.V.), Freezing (V.F.V.C.).

Materials requirements can be categorized into two areas: functional and environmental. The functional criteria of the equipment include heat transfer, mass transfer and storage, whereas the environmental criteria include process conditions such as temperature, pressure, flow rates and composition. Process and cost data will be obtained from construction, operating and maintenance records of pilot and demonstration plants.

A literature survey will be made to collect comprehensive physical property and cost data on commercially available plastics. A computer search program will be developed to perform materials replacement studies. Plastics cost data, such as fabrication costs, when not available, will be estimated. Based on comparative cost analyses, areas where plastics usage may be beneficial will be recommended.

3.0154, CONSTRUCTION AND DEVELOPMENT OF SPIRAL DESIGN ELECTRODIALYSIS MODULE

M. MINTZ, Amer. Machine & Foundry Co., Stamford, Connecticut 06907

This study is for the purpose of developing a low-cost spiral design electrodialysis stack module and new, improved anion exchange membranes. The work proposed will include the construction and delivery of a 10,000 gpd electrodialysis unit of circular configuration, the development of a spiral design electrodialysis stack cartridge, and membrane development. Based on the final field test results, the most promising anion membrane will be selected for further field evaluation on natural brackish waters and a final report summarizing the work accomplished will be submitted.

3.0155, DEVELOPMENT OF A THIN-LIQUID FILM MEMBRANE DEVICE FOR EFFICIENT DESALINATION BY REVERSE OSMOSIS

D.S. DAVIES, Dorr Oliver Incorporated, Stamford, Connecticut 06904

The main objective of this contract is to establish the technical feasibility and the economic potential of the thin-channel concept in large-size reverse osmosis plants. Within the scope of work to be accomplished, the two broad task outlines are to conduct test runs with 25 and 100 gpd thin-channel design reverse osmosis units; and to prepare a conceptual design and economic analysis of the thin-channel concept. This contract could conceivably be considered an extension of Contract No. 14-01-0001-542 which was terminated on December 31, 1967.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3.0156, THE DEVELOPMENT OF AN ANALYTICAL MODEL OF A FLASH STAGE

D.A. FISHER, Univ. of Connecticut, School of Engineering, Storrs, Connecticut 06268

Work is continuing on the model development described below using several sets of recently obtained AMF-Cuno Millstone Point Laboratory Test data: a) the entrance jet region - wherein a submerged wall jet from the entrance orifice, spreads vertically with recirculation above the jet. A high degree of turbulence causes large values of thermal conductivity in the vertical heat flow which evaporates the liquid at the free surface; b) the central portion - wherein the velocity profile adjusts from a maximum at bottom to a maximum near the top; c) the exit region - wherein the fluid is accelerated for entrance into the following stage. The major vertical heat transfer occurs in region b). A typical boundary layer occurs at the channel bottom. Jet induced turbulence predominates. In region b) at the liquid surface vapor is generated at the greatest rate. Turbulent thermal conductivity approximates 300,000 Btu/hr ft degrees F. Tentative relations for turbulent thermal conductivity are proposed. Fluctuations due to the turbulence is suggested as cause of large values of thermal conductivity measured.

3.0160, PLANT-WATER-USE EFFICIENCY WITH GROWTH REGULATORS AND TRANSPIRATION SUPPRESSANTS

D.J. FIELDHOUSE, Univ. of Delaware, School of Agriculture, Newark, Delaware 19711

This project involves laboratory and field investigations for reducing the need for irrigation for certain major vegetable crops.

This involves the use of plant growth regulants and transpiration suppressants. The basic approach in this investigation is the bringing together of isolated biological findings to form a systematic and usable program for increasing the efficiency of plant water use.

The three areas of concentration for increasing plant-water-use efficiency are as follows: 1. To stimulate faster germination and early plant growth in order to establish plants before dry soil conditions exist. 2. To reduce water loss during critical periods of plant growth through the use of transpiration suppressants. 3. To use plant growth regulators for altering plant growth, fruit set, and fruit maturation.

3.0161, PRESSURE AND TEMPERATURE DEPENDENCE OF VOLUME VISCOSITY AND MICROSCOPIC STRUCTURE IN WATER AND SALINE SOLUTIONS

C.M. DAVIS, Amer. University, Graduate School, Washington, District of Columbia 20016

The volume viscosity, η_v , of water and saline solutions will be determined as a function of temperature and pressure by means of ultrasonic absorption. The measurements will extend over pressure and temperature ranges of 1 to 1000 atmospheres and 0 degree C to 100 degrees C respectively. In particular the anomalous pressure dependence of η_v in water will be investigated in order to determine the effect of temperature and salinity on the reported maximum in η_v . Finally the relation between η_v and structural models of liquids will be used as a means of evaluating various proposed structural models of water in terms of the measured values of η_v .

3.0166, A METHOD FOR SYSTEM EVALUATION AND COST-EFFECTIVENESS OF LARGE MULTISTAGE FLASH DESALTING PLANTS

N. ARAD, Planning Research Corporation, Washington, District of Columbia

A methodology, embodying both a probabilistic approach to system performance and a deterministic thermodynamic process analysis, was applied for the evaluation of the system effectiveness and the cost-effectiveness analysis of variations in the design and maintenance concepts of large, multistage flash-type, desalting plants. The analysis of subsystem effectiveness resulted in the development of the Effectiveness Model, which embodies equipment performance and process thermodynamics, for the determination of the desalting plant average annual system effectiveness. The stochastic failure and repair duration processes, which govern equipment performance, were studied and limited available data correlated in order to determine the underlying probability distribution functions. A computer program, to assist in the computations involved in the determination of the life-span values of the average annual effectiveness of the individual subsystems and for the desalting plant as a whole, was developed. The methodology was exercised on a 50 million gallons per day multistage flash plant. An analysis for determining the cost-effectiveness of variations in design and maintenance procedure concepts were analyzed. Twelve variations in design and maintenance procedure concepts were analyzed. Eight of these were found to be cost-effective, demonstrating the validity and usefulness of the methodology developed.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0167, CORROSION RESEARCH

J. KRUGER, U.S. Dept. of Commerce, Inst. For Materials Res., Washington, District of Columbia 20234 (14-01-0001-1091)

The program emphasizes scientific research directed toward providing a basis for the most economical selection and utilization of materials for desalination plants. For this purpose, research is aimed at understanding under practical conditions, how corrosion occurs and how it may be predicted and controlled. The program stresses research on materials of both current and potential interest in desalination systems. Thus materials that are currently

used in distillation plants, copper-nickel alloys and certain aluminum alloys, will be investigated via electron microscopy to determine the extent of initial corrosion and the nature of the protective films which prevent corrosion. There will also be a study of copper-nickel alloys to investigate the question of why adding small amounts of iron in critical concentrations reduces the corrosion rate of material in hot sea-water. Such work may reveal general principles that may be applied to corrosion prevention. Iron and iron alloys are potentially useful materials in desalination systems because of their low cost. However such materials so far have been susceptible to corrosion under distillation conditions. There will be several studies on iron and iron alloys: on the growth kinetics, the electronic properties and the structures of the protective surface film on iron, and on how the film is broken down by chloride ions. The techniques that will be used in these studies, optical ellipsometry, and low-angle electron diffraction, are among the most powerful of modern tools to examine the properties of surfaces. These studies, aimed at understanding how iron corrodes, may point to ways of preventing such corrosion - by alloying, for example, or by altering slightly environmental conditions. The technique of cathodic protection may apply here and there will be work investigating the feasibility of using this method to make iron utilizable. As a further objective, the program makes available to OSW consultative and advisory services directed toward more immediate and short term corrosion problems.

3.0168, THE CONNECTICUT RIVER STUDY

R.B. HANDLEY, U.S. Dept. of Interior, Bureau of Outdoor Recreation, Washington, District of Columbia 20240

Objective - To determine the feasibility and desirability of establishing all or parts of the Connecticut River Valley as a national recreation area.

The present and future recreational needs, supplies, and demands will be analyzed along the Connecticut River itself. This study will be broad in scope giving consideration to such things as open spaces and cultural areas as well as picnic areas, etc.

Procedure - A BOR study group will: (1) Evaluate the recreational, fish and wildlife, forest, and water and power resources of the Connecticut River Valley; (2) Evaluate the Connecticut River and its component parts under the National Recreation Area Criteria, and (3) Prepare a report containing recommendations.

The above can be accomplished in the two years allotted and the study by working closely with and by drawing heavily upon the data being collected by other study groups such as the group preparing the Connecticut River Basin Comprehensive Plan.

3.0170, SCENIC RIVERS STUDY

A.H. UNDERHILL, U.S. Dept. of Interior, Bureau of Outdoor Recreation, Washington, District of Columbia 20240

A nationwide study was coordinated by the Bureau of Outdoor Recreation in 1963-64 to inventory and evaluate wild or scenic river needs and possibilities. The study was supervised by a

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

5-member study team composed of representatives of the Departments of the Interior and Agriculture.

Based on the results of the study, a report 'Wild Rivers' was published, and legislation was recommended by the Administration for the establishment of a Nationwide System of Scenic Rivers. Nine rivers are proposed for initial 'national scenic river' designation. Thirty-five other rivers are earmarked for further evaluation within 10 years after enactment of a Scenic Rivers Bill. Other 'candidate' rivers will be studied by the Secretary of the Interior and Secretary of Agriculture. The proposed legislation also provides for the inclusion of 'State and local scenic rivers' in the Nationwide System.

SUPPORTED BY U.S. Dept. of Interior - Bu. Outdoor Rec.

3.0171, ISLAND STUDY

A.H. UNDERHILL, U.S. Dept. of Interior, Bureau of Outdoor Recreation, Washington, District of Columbia 20240

This survey and planning study has three major objectives: (1) Inventory all 10-acre or larger islands in the U.S., Puerto Rico, and the Virgin Islands by size, ownership, and development status. (2) Identify and evaluate those islands which have significant wilderness, historical, or other recreational values. (3) Develop a program for island conservation.

The Island Study was started during fiscal year 1967. The inventory phase and the detailed studies of those islands with significant recreational values have been completed. The final report, outlining a program for island conservation, should be released during fiscal year 1969.

3.0173, ST. JOHNS RIVER FISHERY PROJECT

H.L. MOODY, State Game & Frsh. Wtr. Fish, Eustis, Florida 32726

The purpose of this study is to monitor fish populations of the entire St. Johns River for fishery conservation purposes.

The rapid rate of human population growth in this section of Florida has produced and is continuing to cause limological and terrestrial changes, through public works and other activities, which has adverse effects on the fishery of the river. The aim of this study is to define these changes more precisely in order that deteriorations of the fishery may be arrested or prevented.

Fish population samples are taken with various standard fishing gear and by different methods, including chemicals, to determine successive changes in the populations and their species composition which may be related to natural environmental factors, water pollution, or to artificial changes in the habitat. Studies of sportfisherman success, harvest rates and fishing pressure are also made.

SUPPORTED BY Florida State Government

3.0174, SYNTHESIS AND EVALUATION OF NEW POLYMER MEMBRANE CANDIDATES FOR APPLICATION IN REVERSE OSMOSIS

T.W. BROOKS, Peninsular Chem. Research Inc., Gainesville, Florida 32603

Proposed work under this contract involves the synthesis and evaluation of certain block or graft copolymers as potential membrane materials applicable in the reverse osmosis process for desalinating brackish water or sea water. Such hydrophilic polymers as poly (ethylene oxide), poly (vinyl alcohol), and poly (diallyldimethyl ammonium chloride) are to be incorporated into block or graft copolymer systems with such hydrophobic partners

as styrene, acrylonitrile, and methyl methacrylate. The hydrophobic segments play a dual role in that they serve to render the hydrophilic segments water-insoluble and to provide adequate compressive modulus to the derived membranes. Each block or graft copolymer system is to be prepared in several compositions in order to ascertain the effect of composition on such membrane properties as water permeability, salt permeability, compression resistance, and other variables which are fundamentally significant in the reverse osmosis process. Where possible, such structural features as stereoregularity and crystallinity of hydrophilic segments will be studied to ascertain the significance of morphology in relation to water transport properties of subject membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0175, WATER CONTROL FOR FOREST PRODUCTION

C.M. KAUFMAN, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Objectives: 1. To determine effects of saw palmetto on availability of soil moisture for tree growth. 2. To evaluate methods for reducing water loss by controlling non-tree vegetation. 3. To determine effective means for controlling water table levels by drainage and by irrigation as measured by tree response.

Procedures: 1. On sites of varied palmetto density; in open and forest, remove palmetto from one plot, leaving paired control undisturbed. Measure density of vegetation and soil moisture for relationships. 2. Control vegetation for planting of select-bred slash and longleaf pine: Already established after 9 treatments of burn, cut, chop, disc, and plow; later to be cultivated. 3. Ditch drain in flatwoods with organic hardpan soils, and test-plant to select-bred slash pine.

SUPPORTED BY U.S. Dept. of Agriculture

3.0176, CULTURAL MANAGEMENT PRACTICES OF FORAGE CROPS FOR PASTURES HAY OR SILAGE

D.E. MCCLOUD, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Object: To develop improved cultural management practices designed (1) to enhance establishment and persistence, and (2) to increase yield and quality of newly developed varieties of forage crops used for pasture, green feed, hay and silage.

Plan of work: Greenhouse, small plots, or miniature pasture paddocks (where animal performance is not measured), will be used to screen forage varieties and mixtures and to study establishment, maintenance, and utilization practices. Establishment studies will include evaluation of plant population or stand density, seedling development, persistence, and botanical composition as influenced by seeding time and rate. Maintenance management will involve time, frequency, and intensity of defoliation by clipping or grazing as related to factors such as LAI (leaf area index). Appraisal of species will include persistence, recovery after defoliation, seasonal pattern of growth, heat, drought and cold tolerance, and competitiveness. Response of new forage crop varieties and mixtures to different kinds, rates, and times of application of fertilizer as well as to supplemental irrigations will be determined. For each experiment appropriate replicated experimental designs will be used.

SUPPORTED BY U.S. Dept. of Agriculture

3.0177, IRRIGATION EFFICIENCY

J.M. MYERS, Univ. of Florida, School of Agriculture, Gainesville, Florida 32601

It is likely that all citrus and many other crops in Florida, in excess of 1,000,000 acres, will be irrigated with lower application rates within the next few years. This will lead to smaller and more frequent applications which may increase the total evaporation losses. Inherent in these low rates of application are many changes which influence evaporation losses. These include smaller droplets, wider sprinkler spacing, extended irrigation time, up to as much as 30 hours on a given area, and higher elevation of sprinkler heads.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The problem of controlling evaporation losses could become particularly serious in the citrus belt of Florida where industrial, domestic and agricultural water consumption is increasing at a rapid rate thus making more efficient application essential.

The evaluation of evaporation losses during irrigation needs to be investigated so that steps can be taken to reduce the losses. As competition for water increases the information to be derived from this research will be essential to sound economic analysis, pertaining to the allocation of water.

University of Florida

3.0178, TEMPORARY LININGS FOR WATERWAYS AND EMBANKMENTS

J.M. MYERS, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Objectives: To determine design criteria for newly constructed waterways and embankments covered with erosion retarding material and to determine hydraulic characteristics of lining materials.

Work proposed: The experimental procedure will involve four types of tests. The first will consist of basic studies to determine some of the more important functional specifications for a cover material. The second and third tests will be combined and will involve the determination of the hydraulic characteristics of existing temporary cover materials in combination with several representative types of Florida soils, and the effect of these cover materials on establishment of a permanent vegetative cover. The last group of tests will consist of field experiments to evaluate laboratory findings and to evaluate methods for installing the materials.

SUPPORTED BY U.S. Dept. of Agriculture
Florida State Government

3.0179, IRRIGATION EFFICIENCY

J.M. MYERS, Univ. of Florida, Agricultural Experiment Sta., Gainesville, Florida 32601

Objective - To evaluate factor influencing irrigation water losses for the various types of systems used in Florida Agriculture.

Description of Work Proposed - An evaluation will be made of factors affecting evaporation losses from sprinkler irrigation. Water droplet size, wind velocity, air quality (temperature and vapor pressure), soil and vegetation are among the factors that will be studied. A wind tunnel type environmental control facility will serve as the primary apparatus for obtaining measurements of water losses due to evaporation. Laboratory findings will be correlated with field results.

3.0180, THE INFLUENCE OF INADEQUATE WATER SUPPLY ON METABOLISM IN BIOLOGICAL SYSTEMS WITH EMPHASIS ON PROTEIN SYNTHESIS AND NUCLEIC ACID METABOLISM

S.H. WEST, Univ. of Florida, School of Agriculture, Gainesville, Florida 32601

Limited water supplies and low water-holding capacities of soils contribute to an environment in which plants are constantly subjected to stress. Water stressed plants provide an excellent tool to study the effect of limited water supply on sub-cellular processes applicable to all biological organisms. Plants provided varying levels of water stress by adding mannitol to their nutrient solutions will be compared with controls. The synthesis of protein essential to life as enzymes and structural units, will receive emphasis. The effect of water stress on amino acid incorporation into proteins and synthesis of specific proteins will be observed. Nucleic acid metabolism will be studied since it plays such an intimate role in protein synthesis by providing the mechanism and genetic information for specific protein formation. Nucleic acids from stressed and control plants will be isolated and compared quantitatively and qualitatively by differential centrifugation, methylated albumin chromatography, radioisotope incorporation and thin layer chromatography. Functionality of each fraction in

protein synthesis will also be measured. This information will be used to determine if tolerance to water stress can be induced by chemicals or management practices and if plants can be altered by critical breeding programs to provide adaptation to insufficient water supplies.

3.0181, THE ELECTROCHEMICAL BEHAVIOR OF METALS AND ALLOYS IN SEA WATER AND THE EFFECT OF BIOLOGICAL SLIMES ON THEIR RATES OF CORROSION

K.G. COMPTON, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

The effects of microbiological slimes on the corrosion rates of metals in natural sea water will be compared to those in sea water from which these micro-organisms have been removed. The purpose of this study is to establish or disprove the need for including the biological factors in any study of materials for use in sea water and, if essential, to determine the extent of the effect. The well established effect of anaerobic organisms will not be included. In the second phase of the study, a galvanic series of metals and alloys in sea water at elevated temperatures will be determined over a range of water salinity. The temperature range in this work will be from 212 degrees to 400 degrees F. The resulting data will establish design criteria to minimize galvanic corrosion effects in plants. The corrosion rates will be determined by the polarization resistance method and will include a small range in velocities. The potentials will be reported as differences between metals and between the metals and reference electrodes.

3.0182, TEMPERATURE EFFECTS ON BIOLOGICALLY INTERESTING MEMBRANE SYSTEMS

W. DROSTHANSEN, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124 (14-01-0001-1649)

It is intended to study the effects of temperature on the properties of two types of membranes which are biologically interesting. The first membrane system to be studied is a non-aqueous ('oil') membrane supported by a solid porous (reactive or non-reactive) matrix (such as a Millipore filter). The second type of membrane to be studied is the bimolecular leaflet membrane. It is intended to measure parameters such as membrane potentials, biionic potentials, electric resistivity and hydraulic permeability (where applicable) of these membranes at closely spaced temperature intervals over a relatively extended temperature range. The purpose of this study is to investigate the effect of temperature on membrane properties in general and, if possible, specifically to relate such observations to structural changes in the water and adjacent to membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0183, FREEZING POTENTIAL STUDY

W. DROSTHANSEN, Univ. of Miami, Graduate School, Miami - Coral Gables, Florida 33124

It is proposed to study certain aspects of the freezing potential phenomena (the development of a potential between an advancing ice front and the unfrozen supernatant liquid, often referred to as the Workman-Reynolds effect). We propose to seek evidence for the existence of transient, polar structures in freshly formed ice and to study the subsequent relaxation of such structures to conform to the overall non-polar structure of bulk ice. The study will include (a) a search for freezing potentials associated with the freezing of dilute solutions of electrolytes in heavy water, (b) the study of the effects of added non-electrolytes (such as alcohol, ketones, etc.) on the freezing potentials obtained with a number of electrolytes in water and (c) a study of the effects of pressure on freezing potentials.

3.0185, RELATION OF NITROGEN LEVEL, HIGH WATER TABLE AND SOIL SALINITY TO GROWTH, YIELD AND FRUIT QUALITY OF DATES

W.C. COOPER, U.S. Dept. of Agriculture, *Orlando, Florida*

Object: To determine the rate of nitrogen fertilization necessary to maintain economical production and high fruit quality of dates; and to study the responses of the date palm to high water table and to soil salinity, especially as regards salt absorption and accumulation in leaves and roots.

Plan of work: A nitrogen-rate trial is being conducted on replicated plots with palms in full bearing on a loam; and a block of young palms on sand will be used in a similar nitrogen-rate trial as soon as they reach bearing age. Pinna samples will be taken for analysis at appropriate intervals to establish, if possible, the respective levels of nitrogen considered to be deficient, adequate, or excessive. The growth and salt absorption of date offshoots and seedlings grown in sand culture and salinized soil plots will be studied. Periodically samples of soil and date pinnae will be taken from date gardens affected by high water table and soil salinity to determine the general level of soil salinity and the accumulation of chlorides in pinnae.

Cooperation: USDA Salinity Lab., Riverside, Calif., and growers.

SUPPORTED BY U.S. Dept. of Agriculture

3.0186, TOLERANCE OF CITRUS TO SALINITY AND BORON IN THE SOIL AND IRRIGATION WATER

W.C. COOPER, U.S. Dept. of Agriculture, *Orlando, Florida*

Object: To study the mechanism of salt-tolerance by citrus trees.

Plan of Work: At the Weslaco station scion-rootstock combinations will be screened for salt and boron tolerance by growing them in field plots which can be flooded with irrigation water carrying graduated amounts of various salts separately and in combination. The trees will then be frozen at the conclusion of the experiment, to study possible interactions of salt tolerance and cold-hardiness. Chemical analysis of plant parts and soil will be made so that growth and cold-hardiness behavior can be related to tissue and soil composition. At Weslaco various rootstock-scion combinations will be tested for salt tolerance when grown under various controlled environmental conditions. Chemical analysis of plant parts will be made to relate plant behavior with tissue composition. At Weslaco and Indio hybrid seedlings will be screened for salt tolerance in field plots which can be flooded with irrigation water carrying graduated amounts of various salts separately and in combinations. Chemical analysis of plant parts will be made to study inheritance of salt tolerance.

Cooperation: Texas Agr. Expt. Sta. Texas.

3.0187, RELATIONSHIP OF TUBE-AND REEF BUILDING MARINE ANNELIDS TO COASTAL ENGINEERING AND CONSERVATION PROBLEMS IN FLORIDA

D.W. KIRTLEY, Florida State University, Graduate School, *Tallahassee, Florida 32306*

Detail the distribution of sabellariidae reefs on the nearshore floor and in inlets and harbors, particularly on the lower east Florida coast. Examine growth rates of worms and worm colonies, developmental history of worm reefs. Determine environmental variables which control size, shape and orientation of reefs. Attempt to isolate parameters which might be controllable in future conservation practices, beach erosion and coastal engineering problems.

3.0188, EFFECT OF PH AND IONIC STRENGTH ON THE CRYSTALLIZATION AND MORPHOLOGY OF POLYMER MEMBRANES AND FIBERS

L. MANDELKERN, Florida State University, Graduate School, *Tallahassee, Florida 32306*

Two major research areas related to the properties of polymeric systems will be investigated. One set of problems is concerned with the effect of pH and ionic strength on the crystal-liquid phase transition of polymer membranes and fibers. The other type of problem to be investigated involves the interaction, swelling and permeation of pure liquids and salt solutions at temperatures well below the melting temperature where the morphology has been pre-defined by controlled crystallization. In the first set of problems we plan to study the behavior of such crystalline polyelectrolytes as polymethacrylic and polyacrylic acid in order to obtain quantitative physical chemical information in regard to the role of pH and ionic strength in influencing the melting temperature and in describing reversible mechanochemical processes. The other area of investigation will be concerned with the properties of cellulose acetate membranes which have been prepared in a prescribed and predetermined manner. Initial interest will be centered on the molecular origin of the multiple transitions that have been reported for this class of polymers, their effects on physical properties and permeability and the influence of thermal and solvent treatment on the location of the transition.

3.0189, MODEL STUDIES FOR DEVELOPMENT AND CALIBRATION OF STREAMFLOW CONTROL DEVICES IN THE SOUTHERN BRANCH

P. MAYER, U.S. Dept. of Agriculture, *Athens, Georgia*

Object: To study models of streamflow control structures, such as Tainter gates, adapted for use on low-gradient channels, and calibrate these devices for measuring discharge rates. To develop similitude relations so that standardized patterns can be designed for flow measurement, and to make exploratory tests for improvements. To develop sensing devices for periodically recording gate positions and water levels. To develop discharge calibrations under various flow conditions with different gate openings. To develop ADP programs to translate data obtained into discharge rates using high-speed computers.

Plan of Work: The plan of work includes the study of scale models, the development of sensing devices, and the development of computer programs. Specifically, scale models of operating Tainter gates are constructed in the hydraulic laboratory and calibrated under different combinations of underflow and overflow, with outlets submerged and unsubmerged, and for installations with one, two, and three gates operating as parallel units. Exploratory studies to improve the structural design are made, and similitude relations developed in an effort to standardize gates. Sensing devices to readout prototype gate positions are adapted for use with water stage recorders so that discharge rates can be determined from degree of gate opening. Using all this in-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

formation, an ADP program is developed to translate field data into discharge rates utilizing the calibration coefficients and equations obtained from flow tests. These investigations are made under a research contract with the Georgia Institute of Technology.

3.0190, ECONOMIC AND AGRONOMIC EVALUATION OF FERTILIZER RESPONSE OF FORAGE CROPS

E.R. BEATY, Univ. of Georgia, Agricultural Experiment Sta., Athens, Georgia 30602

Objectives are (1) to describe the yield of Coastal Bermudagrass and bahiagrass as a function of nutrients and water (2) to determine the influence of continued forage yield stresses on soil physical properties and nutrient content, (3) to establish the economics of forage fertilization.

The two grasses shall be subjected to 9N, 9P and 9K treatments each at two moisture levels. The design shall be cube lattice and the experiment shall be continued until a response has been obtained to the applied nutrients. The forage will be clipped each 4 to 5 weeks throughout the season. At that time an economic analysis of the response of forage production to fertilizer and H₂O will be made. Soil samples will be collected so as to follow soil nutrient changes.

SUPPORTED BY Georgia State Government

3.0191, IRRIGATION REQUIREMENTS, PRACTICES AND METHODS OF APPLICATION FOR EFFICIENT PRODUCTION OF CROPS IN THE SOUTHEAST

J.R. CARREKER, Univ. of Georgia, U.S.D.A. Se. Watersh. Res. Ct., Athens, Georgia 30601

Object: To evaluate water intake, retention, and transmission of soils; determine the effect of the soil moisture regime on crop production as related to stage of physiological development and to management practices; to develop information for predicting need for irrigation; and to develop and evaluate procedures for water application in crop production for different crops and for various site conditions.

Plan of Work: Various types of equipment and techniques for measuring infiltration rates under variable conditions will be compared and evaluated. Soil moisture intake will be related to soil profile. Methods to identify, measure, and evaluate moisture retention and transmission will be studied. Water management practices for crop production will be evaluated under different soil moisture regimes. Determination will be made of (1) water requirements of plants as a function of the physiological state of development, (2) interactions between water management regimes and fertility levels, crop strains, tillage, etc., (3) moisture penetration patterns, plant rooting patterns, and evapotranspiration, (4) interrelations of irrigation with other management practices, (5) field irrigation by surface and subsurface methods in contrast to sprinkler methods, and (6) relationships of water application to soil, slope, row length and grade, furrow patterns, etc.

SUPPORTED BY U.S. Dept. of Agriculture

3.0192, THE EFFECT OF BRACKISH WATER ON PLANTS AND SOIL IN THE SOUTH

J.R. CARREKER, Univ. of Georgia, U.S.D.A. Se. Watersh. Res. Ct., Athens, Georgia 30601

Object: To determine the effect of methods, frequencies, and amounts of irrigation water of varying salt concentrations on plant growth and soil physical properties, and the degree of salinity of potential brackish irrigation water resources.

Plan of Work: Field plot and laboratory studies are used to determine the response of crops to treatments with irrigation water of different salt concentrations. The effect of brackish water on soil properties, and the effects of rainfall in removing salt from the root zone will be determined.

SUPPORTED BY U.S. Dept. of Agriculture

3.0193, THE INTERRELATIONSHIP BETWEEN WATERSHED FACTORS THAT AFFECT RUNOFF RATES AND VOLUME YIELDS IN THE SOUTHERN COASTAL PLAINS

T.H. ROGERS, Univ. of Georgia, U.S.D.A. Se. Watersh. Res. Ct., Athens, Georgia 30601

Object: To identify the watershed factors that influence runoff rates and water yields; and to determine the interrelationships between these factors to develop methods for estimating the magnitude and frequency of storm runoff, and the monthly, seasonal, and annual net water yields for ungaged agricultural watersheds.

Plan of Work: The plan of work includes defining in detail the watershed characteristics of a small agricultural watershed (approximately 20 square miles) near Ashburn, Georgia; expressing these characteristics in numerical form for analysis by digital computers; determining the interrelationships between the watershed factors that logically affect the hydrology of a watershed; and testing the relations determined on a larger parent watershed. Characteristics of a small adjacent watershed (approximately 2.5 square miles) undergoing urban development will also be sampled and compared with those of the predominately agricultural area. The study is under research contract with the University of Georgia.

SUPPORTED BY U.S. Dept. of Agriculture

3.0194, SHALLOW WELLS AND IRRIGATION PITS FOR IRRIGATION AND OTHER FARM WATER SUPPLY IN THE COASTAL PLAINS

A.W. THOMAS, Georgia Coastal Pl. Expt. Sta., Tifton, Georgia 31794

Objectives and Work Proposed: These will be studies of shallow aquifer water supply available to farms. Investigations will be made under a variety of conditions as to quality of the aquifer and environmental topography. They are planned to include the supply efficiency and adequacy of impoundage in irrigation pits and pumping adequacy of shallow wells of various types. The following objectives are specified: (1) To determine topographic and soil conditions which favor or affect condition of water supply in near-surface aquifers. (2) To ascertain for sites selected for study the dependability of water supply through periods of favorable and unfavorable rainfall. (3) To correlate results of tests at different locations under different soil and topographic conditions to establish supply probabilities under intermediate conditions. (4) To develop criteria by which engineers and soil scientists can classify sites for irrigation pits and shallow wells on the basis of topography and soils.

SUPPORTED BY Georgia State Government

3.0195, INVESTIGATION OF SOIL AND WATER LOSSES THROUGH CROPPING SYSTEMS AND SOIL MANAGEMENT PRACTICES

A.W. THOMAS, Univ. of Georgia, Agricultural Experiment Sta., Tifton, Georgia

Objectives: (1) To evaluate certain cropping and land cover on the basis of yield as equated against resulting soil and water losses. (2) To develop principles for the conservation of soil and water based on the evaluation of physical and chemical characteristics of coastal plain soils which influence their susceptibility to deterioration.

Description of Work: Eighteen (18) plots, each 1/20 acre in size, are divided into 2 replicates of 9 plots each. They are on a 3% slope of Tifton loamy sand. Each plot is a separate drainage unit with provisions for measuring volume of 'water lost' by runoff, for the handling of soil loss in the form of settled sludge, and for the determination of soil loss by weight of dry soil. Plot treatments involve (1) a plot which is plowed annually and is kept in a condition of cultivated fallow; (2) a plot on which corn is grown annually with crop residues as winter mulch; (3) a 3-year rotation of annual crops; and (4) a 4-year sod-based rotation which includes 2 years of perennial grass and Crimson clover, corn and

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

peanuts. In the rotations each year of the rotations is included on the plots each year.

SUPPORTED BY Georgia State Government

3.0196, SURFACE WATER STORAGE AND SUPPLY ON FARMS IN THE COASTAL PLAINS

A.W. THOMAS, Univ. of Georgia, Agricultural Experiment Sta., Tifton, Georgia

On existing farm ponds and/or on ponds especially constructed for the purpose, studies will be initiated to accomplish the following objectives under a range of conditions from high watershed water yield and probable high storage efficiency to low water yield and doubtful storage efficiency: (1) To determine optimum storage volume in relation to conditions of the contributing watershed and to determine reliability of supply. (2) To determine losses in potential storage due to excessive flow and the losses in impounded volume by seepage and surface evaporation; to isolate causes of the losses; and to develop methods of reducing losses. (3) To determine the efficiency of a pond as a source of water supply by equating the depth-area ratio to input minus losses for various conditions of coastal plain soils and topography.

SUPPORTED BY Georgia State Government

3.0197, DRAINAGE REQUIREMENTS OF CROPS IN THE SOUTH

R.R. BRUCE, U.S. Dept. of Agriculture, Watkinsville, Georgia

Object: To determine (1) the drainage requirements of specific crops at different stages of development, and (2) the degree of drainage permissible for efficient crop production with minimum of subsidence in organic soils. Plan of Work: Drainage requirements of various crops will be evaluated under conditions of controlled temperature, humidity, and light in North Carolina. Plants will be grown in soil tanks equipped to provide controlled water table movement. It is anticipated that accurate drainage coefficients should be forthcoming for use in drainage system design. Data will be obtained on the relation between water level and rate of moisture use by plants, available water in the soil profile, and crop growth response.

SUPPORTED BY U.S. Dept. of Agriculture

3.0198, EVAPOTRANSPIRATION BY SUGAR CANE

P.C. EKERN, Univ. of Hawaii, Water Resources Research Ctr., Honolulu, Hawaii 96822

Field data from the installation of a large semi-contained hydraulic lysimeter within a major irrigated sugar cane region at the Kunia substation of the Hawaiian Sugar Planters' Association will be given laboratory analysis for correlation of the measured rate of consumptive use with pan evaporation and other soil and meteorological parameters suitable for prediction of irrigation interval scheduling.

Other activities: Calibration of this instrument as a primary standard for the measurement of evaporation from water, Latosol, and successive growth stages of sprinkler irrigated sugar cane; assessment of the patterns of moisture movement within the lysimeter and measurement of the heat budget within the soil; calibration of the neutron probe for tropical soils; and collection of seepage waters for detection of the rate of movement of nitrates and other constituents through the profile into the ground water.

Methods used: A 6 m square, 2 m deep container with walls of fiber glass reinforced resin, supported on an hydraulic scale of nylon reinforced irrigation hose will comprise the lysimeter. Batteries of resistance blocks, tensiometers, and access tubes for neutron probe will be arrayed for in situ record of soil moisture status. A similar array of thermistor units will record temperature gradients within the lysimeter soil. Porous ceramic tubes will be used to maintain soil water suction equivalent to 100 cm of water at the bottom of the soil column. Percolate waters withdrawn through this system will be preserved for qualitative analysis. Correlative studies will be made of the long period (24 hour) water use rates with pan evaporation and other predictive parameters. Short period (hourly rates) will be assessed as reflected in cane growth, particularly in the presence of temporary mid-day wilt.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Hawaii

3.0199, THE EFFECTS OF SALINE IRRIGATION WATER ON SODIUM ACTIVITIES AND PHYSICAL PROPERTIES OF LATOSOLIC SOILS

G. UEHARA, Univ. of Hawaii, Hawaii Inst. of Geophysics, Honolulu, Hawaii 96822

The latosolic soils of tropical regions contain large amounts of iron, aluminum and oxides. Because of the high oxide content, they have excellent physical properties and stand up well to agricultural practices which would quickly cause loss and permanent deterioration in other soils. Many of these soils occur in sub-humid and semi-arid regions and crop production is limited by the lack of water.

It has already been shown in preliminary experiments on Molokai, Hawaii, that saline water can be used successfully for irrigation purposes on these soils.

The objectives of this proposal are: 1. To determine for latosolic soils in Hawaii the amount of salt that can be tolerated in irrigation water without physical deterioration of the soils. 2. To determine the amount of salt absorbed by these soils when different concentrations of salt are used in the irrigation water, and different methods of applying the water are used. 3. To determine the distribution of sodium ions between soil and soil solution and relate this to actual changes in physical properties, to the availability of nutrients to crops, to the fundamental absorptive properties of the soils, and to theoretical explanations of the effects of cations on soil physical properties.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0200, SALINITY TOLERANCES OF CERTAIN TROPICAL SOILS AND RELATIONSHIPS BETWEEN SODIUM ION ACTIVITIES AND SOIL PHYSICAL PROPERTIES

G. USHARA, Univ. of Hawaii, Agricultural Experiment Sta., Honolulu, Hawaii 96822

1. To measure salinity tolerances, that is, the ability of the soil to resist physical deterioration by saline waters in two groups of semi-arid tropical soils. 2. To measure the salinity effect by conventional means and also by a new technique which involves the direct measurement of sodium ion activities. 3. To develop the direct determination of sodium ion activity into a new and more fundamental tool in soil salinity work.

Highly structured tropical soils will be subjected to saline and sodic conditions, and the effects of salts and sodium ions on the physics of these soils will be evaluated. If these soils can withstand saline and sodic conditions, it is hoped that large areas of arid and semi-arid tropical areas with similar soils may be brought to their full agronomic potential by irrigation with saline waters.

SUPPORTED BY Hawaii State Government

3.0201, AQUIFER-STREAMFLOW INTERRELATIONSHIPS IN UPSTREAM AGRICULTURAL WATERSHEDS OF THE PACIFIC NORTHWEST

W.R. HAMON, U.S. Dept. of Agriculture, Boise, Idaho

Object: To determine characteristics of subsurface water movement and losses or gains in stream channels as related to geologic formations and their properties; to evaluate source and disposition of water in complex watersheds and segments thereof as related to geologic and other characteristics; and to assess effects of irrigation water diversions and cultural practices on streamflow and subsurface recharge.

Plan of Work: The work is currently concentrated on the Reynolds Creek Experimental Watershed southwest of Boise, Idaho. Among other factors, the investigations include: geologic mapping, ground water observations; soil moisture determinations; transmission capacities of soils and aquifers; and the consideration of influent and effluent streamflow.

SUPPORTED BY U.S. Dept. of Agriculture

3.0202, WATER ACCUMULATION, FLOOD-WAVE MOVEMENT AND WATER YIELD FROM COMPLEX WATERSHEDS OF THE PACIFIC NORTHWEST

W.R. HAMON, U.S. Dept. of Agriculture, Boise, Idaho

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Object: To study movement of water from unit sources areas or accumulation areas through complex watershed channel systems and how these flows produce hydrographs; to evaluate effects of climatic and watershed characteristics and snow-water accumulation on peak flows and water yield and to develop methods for estimating dependable water yield from sagebrush-range type watersheds.

Plan of Work: The work is concentrated in the Reynolds Creek Experimental Watershed southwest of Boise, Idaho, and in Moscow, Idaho. The general plan is to: sample the range of conditions of precipitation and climate, watershed size, soils, land use, culture, geology, water storage structures, and other watershed factors; develop relationships between precipitation and runoff as modified by watershed factors; and generalize these relationships so the findings may be extended to ungaged watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

3.0203, IRRIGATION REQUIREMENTS, PRINCIPLES AND PRACTICES FOR EFFICIENT USE OF WATER IN THE PACIFIC NORTHWEST

M.E. JENSEN, U.S. Dept. of Agriculture, Kimberly, Idaho

Object: To develop criteria and practices for efficient irrigation water management on major crops and soil types in the Pacific Northwest.

Plan of Work: Field studies will be made of evapotranspiration and climatic data on various crops at locations within major irrigated areas; also the proper balance between crop density, frequency of irrigation and soil fertility. Laboratory studies will be conducted to develop improved techniques that may be used in field studies. The effects of various management factors on water use and water use efficiency, intake rates and soil properties will be determined in field plots, laboratory, greenhouse and growth chambers. Information will be obtained on water use and related climatic factors. Extensive laboratory and field plot work will be conducted on soil structure and moisture retention and transmission of both stratified and non stratified soils. Field studies will be made to modify problem soils to improve intake, storage, and transmission of water and effect of salt removal by organic or inorganic amendments or mechanical means.

Cooperation: Washington, Oregon, and Idaho Agricultural Experiment Stations; SCS; U. S. Bureau of Reclamation; soil conservation districts.

SUPPORTED BY U.S. Dept. of Agriculture

3.0204, SURFACE AND SPRINKLER IRRIGATION SYSTEM DESIGN AND OPERATION FOR EFFICIENT WATER USE IN THE PACIFIC NORTHWEST

M.E. JENSEN, U.S. Dept. of Agriculture, Kimberly, Idaho

Object: To develop improved design and operating criteria and facilities for surface and sprinkler irrigation systems.

Plan of Work: Laboratory, field and model studies will be made with mathematical analyses to develop working relationships and to develop principles of surface irrigation hydraulics. This general procedure will apply to all phases of the work in this line project. Evapotranspiration data will be analyzed and incorporated into working charts and graphs for design engineers. New techniques and devices for applying and controlling irrigation water, including automation, will be developed theoretically, then tested in the laboratory and in the field under normal operating conditions. Laboratory studies will be made to determine the normal operating conditions. Laboratory studies will be made to determine the hydraulics of various gravity and sprinkler irrigation devices and the effects of wear and corrosion on these properties. Detailed studies of the uniformity of irrigation will be made to evaluate the efficiency and effectiveness of current and newly developed systems. Studies of stream size-slope-length of run will be done in plots and field installations to develop usable design and operating criteria. Technical publications and reports, operating procedures and popular type publications will be made available.

Cooperation: Washington, Oregon and Idaho Agricultural Experiment Stations; SCS; U. S. Bureau of Reclamation; soil conservation districts; and others.

SUPPORTED BY U.S. Dept. of Agriculture

3.0205, SOIL AND WATER MANAGEMENT PRACTICES FOR THE CONTROL OR ALLEVIATION OF SALINE AND SODIC SOIL PROBLEMS IN THE PACIFIC NORTHWEST

M.E. JENSEN, U.S. Dept. of Agriculture, Kimberly, Idaho

Object: To study the distribution and quantity of salts and exchangeable cations in salt-affected soils as affected by leaching, water quality, amendments and crop and soil management practices; and to evaluate the effectiveness of practices for removal of soluble salts and exchangeable sodium.

Plan of work: Controlled field experiments are conducted involving variables of culture, tillage, irrigation, drainage or amendment practices to replace sodium or remove salt from the soil with leaching water and to follow by chemical analysis changes in salt content and exchangeable cations. Special emphasis is placed on modification of water transmission properties of soils by mechanical or other means and on design of irrigation systems and management practices to improve the salt and sodium status of affected soils.

SUPPORTED BY U.S. Dept. of Agriculture

3.0206, GEOTHERMAL RESOURCES OF IDAHO

S.H. ROSS, State Bur. of Mines & Geol., Moscow, Idaho

First & Second year: General survey to divide hot spring and hot well areas into ones of potential geothermal energy and ones that are unimportant. Location, ownership, discharge, temperature, and chemical quality of each spring will be determined.

Second & Third year: Detailed studies of areas of geothermal potential.

SUPPORTED BY Idaho State Government

3.0207, INVESTIGATION OF SEEPAGE REDUCTION BY NATURAL PROCESSES IN IRRIGATION CANALS

C.E. BROCKWAY, Univ. of Idaho, Water Resources Research Inst., Moscow, Idaho 83843

The objective of this research would be to develop instrumentation for the measurement of soil properties and flow phenomenon under existing canals and natural channels and to investigate the causes and magnitude of natural sealing processes which occur throughout the season. Field work would be conducted using selected canal sections in the canals near Twin Falls, Idaho in which piezometers, tensiometers and soil moisture measuring tubes would be installed and monitored. The natural biological activities in the silt layers at the bottom of canals would be studied.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch University of Idaho

3.0208, IRRIGATION OF WINTER WHEAT IN SOUTHERN IDAHO

G. MCMASTER, Univ. of Idaho, Agricultural Experiment Sta., Moscow, Idaho 83843

OBJECTIVES: (1) Investigate methods of moisture control and effects on winter wheat at planting. (2) Determine the effect of soil-moisture level in the root zone from planting to heading and from heading to maturity on yield, maturity, protein content and milling qualities of winter wheat. (3) Determine the effect of soil moisture and nitrogen interaction on yield and quality of spring wheat.

Wheat will be planted in seed beds containing different amounts of moisture. Irrigation frequency will be used to maintain different soil-moisture levels from planting to heading and from heading to maturity. The soil moisture will vary from field capacity following irrigation to a predetermined point within the available soil moisture range. Soil-moisture effects will be determined on evapotranspiration, yield, height, test weight, maturity, protein content and milling qualities.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY Idaho State Government

3.0209, EVALUATION OF INORGANIC MEMBRANES FOR ELECTRODIALYSIS OF BRACKISH WATERS

D.B. BOIES, IIT Research Institute, Chicago, Illinois

The performance of an electrodialysis stack using inorganic ion-exchange membranes will be evaluated. The cation-permeable membrane will be based on zirconium acid phosphate and the anion-permeable membrane is based on hydrous thorium oxide. The cell will be operated in the range of 500-1000 gallons per day. Variables to be investigated include feed concentration in the range of 1500 to 5000 ppm dissolved solids, velocity, temperature (ambient to 180 degrees F), and the effect of contaminants including both bicarbonate and sulfate hardness, iron, and anionic surfactants. At least one run will be conducted for a period in excess of 500 hours to obtain information on the stability and life of these membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0210, CONCEPTUAL DESIGN STUDY FOR ELECTRODIALYSIS

D.B. BOIES, IIT Research Institute, Chicago, Illinois

The objective for this program is to investigate new concepts in electrodialysis for the desalination of water. The present work involves an investigation of electrodialysis using membranes with embossed flow channels. Such a design will lend itself to more economical and simpler cell construction by elimination of the conventional spacer, and possibly to improved cell performance.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0211, THE PREPARATION OF REVERSE OSMOSIS MEMBRANES BY THE SURFACE MODIFICATION OF CELLULOSE AND RELATED MATERIALS

J.J. HILLMAN, IIT Research Institute, Chicago, Illinois (14-01-0001-1445)

The purpose of this investigation is to obtain a material system of reverse osmosis membrane preparation which would be characterized by an inherent ability to form exceedingly thin active layers under conditions susceptible to very careful control and regulation. The end goal is the preparation of reverse osmosis membranes of substantially higher water flux values than the Loeb-type membranes without diminution of their salt-discriminating function.

This is to be achieved by the superimposition of an exceedingly thin salt-rejecting membrane or layer upon the surface of a polymeric film whose thinness, chemical nature, and morphology endow it with ample water flux but with insufficient salt-rejecting ability. This arrangement will be approached in a number of different ways. Each should be capable of producing the active salt-rejecting layer in degrees of thinness approximating monomolecular dimensions. Chief among these is the vapor and liquid phase acetylation of cellulose films.

The proposed undertaking will define in the laboratory the reactions, reaction conditions, and post-reaction treatments necessary to achieve high water flux and salt-discrimination qualities by surface modification. It will also concern itself with the investigation and elucidation of the water diffusion and salt-rejection mechanisms that will characterize the subject membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0212, PREPARATION OF REVERSE OSMOSIS MEMBRANES BY SURFACE MODIFICATION OF CELLULOSE AND RELATED MATERIALS

J.J. HILLMAN, IIT Research Institute, Chicago, Illinois

The goal of the current program is the development of reverse osmosis polymer membranes superior to those currently in use. This objective is presently being pursued by direct chemical alteration of the surface of a polymeric film whose thinness, chemical nature, and morphology endow it with ample water flux but insufficient salt rejecting ability. Because of the present utility

of cellulose acetate as a reverse-osmosis membrane, efforts involve the surface acetylation of cellulose. Proper environmental control during acetylation with acetyl chloride has resulted in the achievement of a membrane that exhibits a salt rejection of 92% and greater durability than the Loeb membrane after extended use.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0213, IMPROVEMENT OF THE CORROSION RESISTANCE OF ALUMINUM BRASS FOR USE IN SEA WATER CONVERSION PLANTS

M.A. HOWES, Illinois Institute of Technol., IIT Research Institute, Chicago, Illinois 60616

Standard aluminum brass has a good inherent corrosion resistance in sea water and also forms a 'self-healing' protective surface. The protective quality is related to the aluminum oxide component in the surface film. This work is directed towards improving the corrosion resistance of aluminum brass by promoting the formation of bohmite, a compact hydrated form of aluminum oxide ($Al_2O_3 \cdot H_2O$). This will be carried out in an oxidizing atmosphere based on carbon monoxide, carbon dioxide, and water vapor at temperatures around 1000 degrees Fahrenheit. The kinetics of the reaction will be studied and the optimum conditions will be corrosion tested in 3 1/2% brine solution, first under static conditions and then in a loop system.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0214, FIELD EVALUATION OF THE SUL-BISUL ION EXCHANGE PROCESS FOR DESALTING BRACKISH WATERS

K.A. SCHMIDT, Elgin Softener Incorporated, Elgin, Illinois 60120

To evaluate the operational performance of the Sul-biSul ion exchange process using brackish waters of different composition and salinities by employing a speciality designed mobile unit. Data on resin performance and criteria on equipment design useful in extrapolating to large size plants will be obtained.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0215, CONCEPTUAL DESIGN STUDY ON REVERSE OSMOSIS MEMBRANE ASSEMBLY MODULAR UNIT

J.D. ZEPP, General American Trans Corp., Niles, Illinois

Under this program, conceptual design studies will be conducted on several reverse osmosis membrane assembly modular unit designs suitable for use in large-scale desalination plants. Investigations on the technical and economic feasibility of employing shell-and-tube reverse osmosis membrane assembly modules with shell-side feed will be made. The membrane will be located around the outer periphery of thin tubes made of a suitable support material. Turbulence will be provided by either staggered baffles or the tubes themselves. Four different tube and baffle arrangements will be examined in sufficient depth so as to determine the feasibility of each for use in the construction of commercial reverse osmosis plants.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0216, CONTROLLED FREEZING DESALINATION

B.T. CHAO, Univ. of Illinois, School of Engineering, Urbana, Illinois

The main objective is to study the heat and mass transfer processes associated with the separation of dissolved salt from brine by controlled freezing at the exterior surface of chilled pellets which traverse in the brine, initially downward and then upward. The reversal in pellet motion is brought forth automatically by the reduction in its apparent density as the ice layer formed over its external surface grows. Sealed in the pellet is a substance which is initially frozen solid and gradually transforms to the liquid state as heat is transferred into it. The pellets serve both as artificial nucleation sites and as carriers of ice.

Analytical studies are being made to develop suitable mathematical models for the description of the multi-region heat flow

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

problem involving phase change and mass transfer. Experiments would be conducted to examine any shortcomings of the theory and then to seek improvements.

SUPPORTED BY University of Illinois

3.0217, LABORATORY STUDIES OF CONSERVATION AND DRAINAGE STRUCTURES

R.N. FENZL, Univ. of Illinois, Agricultural Experiment Sta., Urbana, Illinois

The first phase of a laboratory investigation of factors contributing to bed scour below a cantilevered pipe outlet was completed. Depth and volume of scour were measured in relation to height of the outlet above the bed, jet velocity, and depth of tailwater over the bed. Mean fall velocity of the cohesionless bed material was estimated through empirical relationships. It was concluded that scour was related primarily to the outlet jet velocity.

University of Illinois

3.0218, TRANSFER OF SALT AND WATER ACROSS MEMBRANES OF PLANT MITOCHONDRIA

J.B. HANSON, Univ. of Illinois, School of Agriculture, Urbana, Illinois

Proposes a study of active salt and water transport in corn mitochondria in three phases.

1. To determine conditions essential for obtaining active transport of monovalent ions into the mitochondria, and the relationship of this transport to the nature of the accompanying anion. The part played by various cations and anions in spontaneous swelling will also be examined to see if the hypothesis is sound that swelling is caused by cation reaction with the non-phosphorylated intermediate of oxidative phosphorylation. 2. The effect of water and water structure on the stability and rate of energy-linked function in the membrane will be studied. An examination will be made for temperature anomalies in the energy-linked functions which would suggest that water structure is implicated. The results with various cations (phase 1) will be studied with respect to the properties of the hydrated ions in regulating stability of high-energy intermediates.

3. The role of phospholipids in energy-linked functions will be investigated. The amounts and kinds of phospholipids in active and senescent mitochondria will be determined. Experiments will be performed with auxins, which tend to increase the phospholipid content of mitochondria.

Statistical-mechanical methods are to be applied to these problems. 1. The calculation of the thermodynamic properties of the 'primitive model' of single and mixed electrolyte solutions with reasonable numerical accuracy at concentrations as high as 1 molar. 2. Calculation of the terms in the equivalent conductance of order $c \ln c$ and c , where c is the concentration, for unsymmetrical electrolytes and for mixtures, on the basis of the simplest (Debye-Huckel) model. 3. Calculation of nuclear-magnetic relaxation times in ionic solutions and their relation to transport coefficients, on the basis of the simplest model. 4. Study of the effects on all of the above of using more realistic models.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0219, RAINFALL EVALUATION STUDIES

F.A. HUFF, Univ. of Illinois, State Water Survey Division, Urbana, Illinois

The evaluation of field experiments in weather modification is extremely difficult since natural variations in weather often exceed the changes which the experiment is attempting to induce. This grant will provide for a study of natural weather variability over a densely instrumented rain gage network now in existence near the University of Illinois. The effort will include:

1. An investigation to establish the effects of natural rainfall variability. 2. distribution patterns. 3. An investigation of the time distribution of rainfall. 4. Establishment of space and time sampling requirements to determine reliability of an arial basis.

Evaluation of various statistical tests and techniques for application in rainfall modification experiments in the Midwest.

3.0221, INFLUENCES OF SALINE WATER ON CONCRETE

W.L. DOLCH, Purdue University, School of Engineering, Lafayette - West Lafayette, Indiana 47907

This investigation will involve the study of the effects of saline waters, of the composition and at the temperatures of interest in the problem of sea-water conversion, on cement paste and concrete.

The effects on the chemical composition of the hardened cement paste will be studied. New phases produced will be identified. It is hoped to gain information on their rate of formation and the effects of temperature.

The effects on the dimensional stability of pastes, mortars, or concretes will also be studied. The properties to be investigated are volume change, strength, and elastic modulus.

3.0222, THE EFFECT OF SUBSOIL TREATMENT ON SOIL CONDITIONS, CROP GROWTH, AND RUNOFF

H. KOHNKE, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

The objectives are to determine to what degree subsoiling, subsoil fertilization and vertical mulching affect soil conditions, growth of crops and surface runoff. It consists essentially of two parts: watershed runoff studies and plot studies.

Description of work: The watershed studies have shown only minor effects of subsoiling on runoff. For this reason this work has been simplified by using on three subsoil treatments (untreated, subsoiling with subsoil fertilization, vertical mulching) and by merely determining peak runoff rates instead of total amounts of runoff.

The plot experiments are being continued on the same plots that were used for this purpose for a number of years, in order to determine whether repeated subsoiling will bring about essential changes in soil conditions and crop yield increases.

SUPPORTED BY Indiana State Government

3.0223, MOLECULAR BEAM INVESTIGATION OF THE WATER MOLECULE

C.R. MUELLER, Purdue University, Graduate School, Lafayette - West Lafayette, Indiana 47907

The primary objective of the research is the detailed study of interactions of the water molecule--monomer with monomer and monomer with dimer, etc. The first measurements will be made of the differential collision cross-section with thermal beams. Subsequent measurements will be made with seeded sonic beams to obtain velocity selection and inhomogeneous electric fields to incorporate rotational state selection. This will provide information on the asymmetry of the intermolecular potential of the water molecule.

The experiments will be done with the modulated molecular beam technique with sharply tuned preamplifiers and long time averaging by use of the Enhancetron signal averager.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0224, PREDICTING RUNOFF AND GROSS EROSION FROM FARMLAND AND DISTURBED AREAS

W.H. WISCHMEIER, Purdue University, Agricultural Experiment Sta., Lafayette - West Lafayette, Indiana 47907

Objectives: (1) Improve precision of field soil-loss estimation to guide farm planning for soil and water conservation, (2) develop an empirical soil-loss equation universally applicable wherever the factors can be locally evaluated, and (3) develop equations, tables and graphs to serve as ready-reference source for locality values of the factors.

This is a State companion project for the Agricultural Research Service national runoff and soil-loss data laboratory. Basic data assembled from 47 locations in 24 states will be statistically analyzed by machine methods.

SUPPORTED BY Indiana State Government

3.0225, DEVELOPMENT OF SUPPORTING RUNOFF AND EROSION CONTROL PRACTICES AND SYSTEMS IN THE CORN BELT

W.H. WISCHMEIER, Purdue University, U.S.D.A Soil & Wat Cons. Lab., Lafayette - West Lafayette, Indiana 47907

Object: To develop and test improved terraces, diversions, contour, contour stripcrop systems and other supporting conservation practices for control of runoff and erosion and waterways.

Plan of Work: Work under this line project will be located in areas where a particular phase of the study is a critical problem. Terrace studies will be conducted on field-size units. Runoff and soil losses will be measured by weirs, flumes, silt samplers and surface elevation readings. Rates of runoff and channel depth probabilities will be determined throughout the terrace of diversion length. Stripcropping studies will involve row grade and strip width on field plots representative of on-the-farm strip crop installations. Wind erosion control practices are under study to prevent filling of drainage ditches.

SUPPORTED BY U.S. Dept. of Agriculture

3.0226, INVESTIGATIONS OF EROSION CONTROL AND WATER CONSERVATION

C.E. BEER, Iowa State University, Agricultural Experiment Sta., Ames, Iowa 50010

This project is designed to study and quantitatively evaluate the factors associated with soil erosion. Included in the study is the determination of components of the hydrologic cycle (precipitation, runoff) and how they relate to the process of sheet and gully erosion.

Analyses to date have provided information for use in the design of more efficient methods of soil and water management. This has been accomplished through development of factors used in the Universal Soil Loss Equation and a quantitative expression for prediction of gully development.

The procedures used in the research include data collection from instrumented watersheds and small plots. The watersheds vary in size from 7 to 14 mi² and are instrumented for precipitation measurement, amount and rate of runoff and sediment production and detailed changes in land cover and erosion development. The small plots are instrumented in a similar manner.

The location of the experimental areas is in Western Iowa and situated in the land resource area characterized by a deep-loess soil.

This project was initiated in 1949, however the problems receiving the research emphasis have changed during its tenure. The completion date is set for June 30, 1969.

SUPPORTED BY Iowa State Government

3.0227, INFLUENCE OF STRONGLY BOUND COUNTER-IONS ON PERMSELECTIVE MEMBRANES

F. DEKOROSY, Negev Inst. For Arid Zone Res., Beersheva, Israel

Counter-ions are attracted to the active sites of permselective membranes by forces which differ according to the size, charge and van der Waals forces relative to them. Strongly bound counter-ions decrease the permselectivity of the membrane, they also cause de-swelling and thus may affect the conductivity of the membranes by orders of magnitude. Strongly bound counter-ions with charges higher than that of the site may change the net charge and thus the sign of permselectivity of the membrane.

In this project we are going to vary the capacity, pK, cross linking and thickness of the membranes and charge and size and van der Waals attraction of the counter-ions. We are going to investigate the influence of these parameters on the electrochemical properties of the membranes. Extremely thin membranes will be investigated in the same manner. We are going to investigate the kinetics of 'poisoning' and 'depoisoning' of membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0228, CONCEPTUAL DESIGN STUDY ON ELECTRODIALYSIS MEMBRANE ASSEMBLY MODULAR UNIT DESIGN

C. FORGACS, Negev Inst. For Arid Zone Res., Beersheva, Israel

This contract was undertaken to develop new and improved conceptual designs for electrodialysis desalination membrane assembly modular units which are economical and practical for use in brackish water desalting plants of 1, 5, 10 and 50 millions gallons per day (mgd) capacity. In order to accomplish this, information must be provided in sufficient detail on the proposed membrane assembly modular unit design to show that the design is practical as assessed against present state-of-the-art, and has the potential to be economically superior to present day technology electrodialysis plant designs. It must also be shown that plants based on these designs will be capable of producing potable water in the quantities and of the quality stipulated at an economically attractive cost. Critical design parameters and components associated with the proposed conceptual design will be identified. They should be explored through pilot plant studies to verify their economics and integrity.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0229, PHYSIOLOGICAL ADAPTATION OF PLANTS TO MOISTURE AND OSMOTIC STRESSES WITH RESPECT TO SALT ACCUMULATION

Y. VAADIA, Negev Inst. For Arid Zone Res., Beersheva, Israel

Object: (1) To study nutrient and salt fluxes and accumulation in intact plants and excised tissues at high concentration and/or tissue saturation; (2) to evaluate the effects of salinity and moisture deficits on energy metabolism; (3) and to assess hypothesis explaining growth reduction due to salt and water stresses.

Plan of Work: The research will involve a wide range of plants including sunflower, barley, beans, peas, tobacco and others. Experiments under objective (1) will involve kinetic study of salt fluxes in excised and intact plant roots at salt saturation and high external concentration. Anions such as chloride will be used primarily. Under objectives (2) and (3) measurements will be made of oxidative activity on intact cells in excised tissue and cell free organelles. Particular attention will be given to phosphorylation/ Under objective (3) we have already shown that variation in the supply and translocation of kinetin-like root hormones may regulate the modification in shoot metabolism under stress. Experiments will be designed to test in a preliminary manner the effect of root hormones, endogenous as well as synthetic analogs on energy metabolism.

SUPPORTED BY U.S. Dept. of Agriculture

3.0230, PERFORMANCE AND SCIENTIFIC DESIGN OF SPRINKLERS USED FOR IRRIGATION

H.J. FINKEL, Technion, Haifa, Israel

Object: To investigate the hydrodynamic properties and performance of different types of sprinklers, and develop principles for improvement in their design.

Plan of Work: The hydrodynamic properties of currently used sprinklers will be studied using high-speed motion picture

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

techniques, and equipment for drop counting, sizing, trajectory plotting, and impact measurement. The process of stream breakup and drop formation and size in relation to orifice shape and pressure will be studied for the development of design principles. These principles will be used in the design of improved sprinklers for the efficient application of water at desired intensities, high uniformity of distribution, a minimum of evaporation loss, and low impact forces. Sprinklers will be built according to the new design and tested both in the laboratory and field.

SUPPORTED BY U.S. Dept. of Agriculture

3.0231, BIOLOGY AND CONSUMPTIVE WATER USE OF PERENNIAL RANGE PLANTS UNDER DESERT CONDITIONS

M. EVENARI, Hebrew University, Jerusalem, Israel

Object: To obtain basic data on soil-water-plant climate relationships and to study the biology, phenology, growth, yields, and persistence of perennial grasses and other range plants, with different water regimes under natural desert conditions.

Plan of Work: Four to five species of the following group will be studied: *Hordeum bulbosum*, *Phalaris tuberosa*, *Orzopsis miliacea*, *Avena sterilis*, *Lolium rigidum*, *Cynodon dactylon*, and *Medicago sativa*. Effects of density on yields and persistence will be investigated. Six flood treatments are planned for the first three years: one flood (early); one flood (late); two floods (early); two floods (late); three floods; and five floods. A 'flood' means wetting to field capacity the root zone (5-6 ft. depth). In the fourth and fifth years, a no flood treatment and variations in flooding depth (2-7 ft) will be introduced. Net assimilation rate, relation of phenology to water regime, growth rate, dormancy, yield and persistence of plants will be correlated with the seasonal march of soil moisture. Soil moisture along the whole wetting profile will be measured every two weeks during the growing season and every four to six weeks during other seasons of the year.

SUPPORTED BY U.S. Dept. of Agriculture

3.0232, ION TRANSPORT IN SOME HALOPHILIC ORGANISMS

B.Z. GINZBURG, Hebrew University, Jerusalem, Israel

This work concerns ion metabolism in some halophilic bacteria and algae. These organisms are adapted to life in solution containing 30% salt. It has been shown that such organisms have more powerful mechanisms for the regulation of their ions than do organisms from more usual habitats. It is proposed to relate a biophysical study of ion concentrations and fluxes with the biochemical means whereby chemical energy is liberated and transferred to the transport systems of those ions transported actively across the cell membranes. The results will be used to test the theory of transport processes derived from the thermodynamics of irreversible processes by A. Katchalsky and his coworkers.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0233, CROP, SOIL AND WATER USE EFFECTS OF LOW INTENSITY SPRINKLER IRRIGATION

S.D. GOLDBERG, Hebrew University, Jerusalem, Israel

Object: To determine the effects of greatly reducing the rate of sprinkler irrigation application on water use requirements of crops, irrigation erosion, soil aeration and aggregation, microbiological activity, and crop yield and quality.

Plan of Work: Use will be made of a range of soil textural classes with particular attention to the medium to fine sizes. Five representative crops, (probably peanuts, cotton, alfalfa, citrus and vegetables) will be included. The intensity of irrigation water application will range from the maximum infiltration rate to only a relatively small fraction of the established rate. Data will be secured on crop yield and quality; water use, including water delivery, runoff and soil loss if any, water distribution, and soil moisture to below root zone; and climatic factors, including rainfall, humidity, radiation, temperature and wind as needed for interpretation of water use data. Evaporation losses during water application; deep percolation losses; and soil aeration, aggrega-

tion and microbiological effects of water application will be evaluated. Periodic records will be secured of plant disease developments. Records will be kept of water application equipment so hydrodynamic characteristics may be determined from A10-SWC-11 is desirable.

SUPPORTED BY U.S. Dept. of Agriculture

3.0234, ION DISCRIMINATION BY HYDROPHOBIC MEMBRANES

A. ILANI, Hebrew University, Jerusalem, Israel

Filters containing fixed negative charges of low concentration will be produced by various methods. Such filters will be saturated with hydrophobic solvents and interposed between aqueous solutions. The ability of such membranes to discriminate between various cations will be studied by measuring:

1. Equilibrium distribution ratio between water and membrane of various cations.
2. The dependence of the resistance of membrane on the counterion present in the aqueous medium.
3. Bi-ionic potential across such membranes.
4. The diffusion coefficient of ions in such membranes.

It is essential to have a low concentration of fixed charge sites in order to maintain hydrophobicity of the filter. If the charge sites' concentration is too high the hydrophobic solvent will be displaced from the filter's pores by water as soon as it is exposed to the aqueous solution. On the other hand, with no fixed charged sites in the membranes the situation reduces to that of diffusion through homogeneous hydrophobic solvent layer. The effect of a change in fixed charge sites density on ion diffusibility within the membrane will be studied.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0235, DIFFERENCE IN EFFECTS OF FOREST AND OTHER VEGETATIVE COVERS ON WATER YIELD

A.Y. SHACHORI, Ministry of Agriculture, Nathanya, Israel

Object: To determine the characteristic effects of pine forest, oak-chaparral, grass cover, and bare ground on moisture loss and disposition of precipitation in the Karst formation of the Cenomanian-Turonian complex in Israel.

Plan-of Work: Two blocks of four plots each, representing pine grass and bare areas have been selected for study near Mt. Carmel, in Israel. Three techniques of investigation will be applied to these plots: (1) Direct measurement of water loss from soil and rock: Each plot is equipped with five aluminum access tubes installed to depths of 10-12 meters. (2) Direct evapotranspiration measurements from oak-chaparral and grass cover will be made with a 10-square-meter transpiration tent. (3) Energy balance determination: Bimonthly measurements of incident and reflected short wave radiation, and net radiation, will be made throughout the year from a helicopter hovering 10 meters above the vegetation canopy. (7.5 pmy)

SUPPORTED BY U.S. Dept. of Agriculture

3.0236, THE EFFECT OF BOLL MOISTURE STRESS ON DEVELOPMENT AND LINT QUALITY OF COTTON

A. MARANI, Hebrew University, Rehovot, Israel

Object: To define the effects of low and high levels of moisture stress applied under varying climatic conditions and at different stages of growth to two varieties of cotton selected for their differences in response to climate.

Plan of work: Each year experiments will be conducted at three locations--(a) the coastal plain with mild summer temperatures and high relative humidity, (b) the Negev region with higher temperatures and low relative humidity, and (c) the Boisan valley with a very hot dry climate. In each location the eight following treatments will be compared: No irrigations after planting; moisture stress from beginning of flowering for six weeks; from beginning of flowering for three weeks; from beginning of boll development to end of season, from beginning of boll development for three weeks; from mid-bolling to the end of the season; two moisture stress periods as in 3 and 6; and complete irrigation. Soil moisture at different depths of all plots will be recorded daily, and flower and boll counts made throughout the season. Lint per-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

cent, boll size, upper half mean staple length and lint quality will be determined at several harvesting periods. Vegetative development will be assessed. Stomatal aperture will be evaluated and leaf sap examined, and these data related to the soil and climatic conditions at sampling time. (2.25 pmy per yr.)

SUPPORTED BY U.S. Dept. of Agriculture

3.0237, AGRICULTURAL UTILIZATION OF SOILS AFFECTED BY SALINITY

S. RAVIKOVITCH, Hebrew University, Rehovot, Israel

Object: To determine the yield response of plants growing in saline substrates to the application of specific combinations of plant nutrients; to study ion movement in soils and resulting exchange reactions; and to select salt-tolerant plants that will produce economic yields when irrigated with moderately saline waters.

Plan of Work: Plants of economic value in agriculture will be grown on slightly to moderately saline soils of different properties. Cereals, legumes and vegetables will be selected according to their growth and production for special plant nutrient supply studies. The effects of different rates and combinations of macro and micro plant nutrients on the growth and production of the various selected plant species will be evaluated. The movement of plant nutrient ions in the saline soils will be followed and the influence of these ions on exchange reactions determined. Initial phases of the product will be conducted under greenhouse conditions, and crops and fertilizer treatments exhibiting favorable results studied under field conditions.

SUPPORTED BY U.S. Dept. of Agriculture

3.0238, RUNOFF INDUCEMENT IN ARID LANDS

D. HILLEL, Volcani Inst. of Agric Res., Rehovot, Israel

Object: To apply recent developments in the theory of rain infiltration in layered soils to the practical problem of controlling infiltration and runoff; (2) to study the feasibility of using various treatments to seal the soil surface against infiltration and stabilize it against erosion; (3) to develop practical methods for inducing and utilizing runoff in crop and pasture production and in reservoir supply.

Plan of Work: (1) Lab trials: a series of experiments to test various surface treatments designed to form a stable impermeable crust with combined chemical and mechanical treatments. This stage will necessitate the construction of devices for measuring infiltration, runoff and erosion under sprinkling and flooding. Prototypes of such devices have already been developed at Rehovot and have proved their usefulness. (2) Field trials: Results of preliminary laboratory trials will be tested under field conditions. Runoff plots will be constructed to permit measurement of runoff yields and erosion under natural and artificial rainstorms. (3) Large-scale applications: Results of laboratory and field trials will be applied in full-scale systems of runoff utilization. Methods of runoff inducement will also be applied to pilot engineering projects such as stockwater reservoirs, cisterns, retention dams and water-spreading systems.

SUPPORTED BY U.S. Dept. of Agriculture

3.0239, WATER TRANSPORT THROUGH HYPERFILTRATION MEMBRANES

O. KEDEM, Weizmann Institute of Science, Rehovot, Israel

Osmotic water flow and water self-diffusion through solvent-swollen gels and through hyperfiltration membranes were recently investigated. The results indicate that the mechanism of water flow in cellulose acetate membranes is close to molecular diffusion in liquids. We thus hope that the measurement of water diffusion in organic liquids may lead to a rational choice of alternative polymers. We plan to estimate the mobility of water relative to the solvent by simultaneous tagging of water and the organic solvent.

Polymer membranes will be tested. We have shown that salt rejection as a function of flow rate can be predicted from the salt permeability and the reflection coefficient ('apparent osmotic pressure') of the membrane, both measured in the absence of

volume flow. In particular, the maximal salt rejection, which can be reached in practice only very thin selective films, is given by the reflection coefficient which is easily measured. This test procedure will be checked and, if necessary, modified for concentration-dependent transport coefficients.

3.0240, DESALINATION BY THE INVERSION ON THE ORDER OF MELTING BY APPLIED PRESSURE

R.G. AKINS, Kansas State University, School of Engineering, Manhattan, Kansas 66504

The ultimate objectives of the proposed work is to make technical and economic feasibility study of a freezing process which takes advantage of the abnormal melting point curve of water in upgrading heat energy. In this process, a suitably selected working medium is used to remove heat in the ice making operation by melting the medium at a low pressure and to supply heat in the ice melting operation by solidifying the working medium at a sufficiently high pressure.

The proposed work can be broken into two parts: the first part would be that of continuing the gathering of thermodynamic data on the organic working mediums. The second (and major) part would be to construct and operate a 1,000 gallons per day (fresh water) semi-pilot plant. In this study, the effects of the operating variables on the rate of heat transfer both in the ice making and ice melting operations and the quality of ice crystals produced will be studied. In the operation of this proposed semi-pilot plant, information for planning a full size pilot plant can be obtained and control problems and other basic physico chemical processes associated with the process can be studied.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0241, OPTIMAL DESALINATION SYSTEMS

L.T. FAN, Kansas State University, School of Engineering, Manhattan, Kansas 66504 (14001-001-1283)

It is proposed that a number of problems of prime interest to the Office of Saline Water be approached adopting freely any method or combination of methods of optimization which suit the problems and situations. Problems to be considered include (1) additional optimization studies of the reverse osmosis and multieffect, multistage flash evaporation systems; (2) optimization studies of other desalination processes such as electrodialysis systems; (3) the development of additional optimization techniques and computational techniques that are needed for the optimization of desalination systems; (4) optimization of desalination systems during unsteady state operation; and (5) optimization studies related to the reliability and management of desalination systems.

While the major concern of this proposed work is not the development of system equations or models characterizing systems and their components, the broad interests and capabilities of the present investigators will make possible the development of performance equations to provide representative optimal solutions for specific systems or components. The major emphasis, however, will be in optimizing already formulated system models satisfying the objective functions and constraints of the systems.

3.0242, PRODUCTION OF HIGHLY PALATABLE WATER FROM AIR FOR HOUSEHOLD, LIVESTOCK, AND INDUSTRIAL USE

R.C. HALL, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

The shortage of water is a recurrent problem in agriculture and industry. It is believed that there are good possibilities of producing potable water by absorbing water vapor from the air with a liquid such as ethylene glycol, followed by separation of the water and glycol in a solar still. The design of solar stills is well along; therefore the objectives of this project are: 1. Design and test equipment for absorbing water from the air. 2. Make estimates of the economics of the proposed process. Triethylene

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

glycol will be used as the first absorbent. Various contacting devices, such as towers, will be designed and their operating characteristics determined. After the most efficient design is found, a large scale absorber will be built from which costs data may be obtained.

SUPPORTED BY Kansas State Government

3.0243, ECONOMICS OF SOIL CONSERVATION PRACTICES WITHIN WATERSHEDS

R.D. MCKINNEY, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

Objectives: To make economic analyses of applied conservation practices and associated cultural practices using the 10 years of data that has been gathered in three Kansas watersheds since 1953. To analyze the economics of applied conservation practices by watershed, by farm and by soil types.

Description of Work Proposed: The ten years of collected data will be processed so that land use cultural practices and applied conservation practices can be associated with all lots of land and soil types. Detailed analyses will be made of the effect on yield of contour farming, terracing by crops, soil types and by farm organizations. Weather data is available in one watershed. This data will be used in correlation studies on yields and cultural practices. The data gathered for this economic study will also be used in a cooperative study with A.R.S. which has collected sediment and run off data on the Sabetha Watershed over a ten year period.

SUPPORTED BY Kansas State Government

3.0244, EVAPOTRANSPIRATION AND ITS CHEMICAL REDUCTION

W.L. POWERS, Kansas State University, School of Agriculture, Manhattan, Kansas 66504

Precision lysimeters will be used to measure evapotranspiration (loss of water by evaporation from soil and plant surfaces) from agricultural land. Relationships between plant and environment (wind velocity, air temperature, humidity soil temperature, soil water, and radiation) and evapotranspiration will be formulated for short (less than one hour) periods of time. Using the knowledge gained, transpiration reducing chemicals will be applied to plants and their effectiveness measured by lysimeters.

The precision lysimeter along with the collected plant environment data will be used as a standard for comparison with the present indirect, but more mobile Bowen Ratio method for estimating evapotranspiration from chemically treated plots throughout Kansas.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
Kansas State University

3.0245, SOIL WATER MOVEMENT

W.L. POWERS, Kansas State University, Agricultural Experiment Sta., Manhattan, Kansas 66504

The objective of this research is to measure water movement in soil and use the information obtained from these measurements to evaluate water management and conservation practices.

Water movement in soil profiles will be followed by mercury-in-glass tensiometers supplemented with Bouyoucos gypsum blocks or gravimetric measurements. Hydraulic gradients determined with the tensiometers and Bouyoucos blocks will be used to determine capillary conductivity values of the water in the soil.

Water management and conservation practices will be evaluated on the basis of the information found from this water movement research.

Kansas State Government

3.0246, INTER-DISCIPLINARY RESEARCH IN THE AREA OF THE KANO PLAINS, WESTERN KENYA

S. OMINDE, Univ. College, Nairobi, Kenya

I. Ecological surveys, settlement and land use - Work is already in progress at University College on settlement and land use

in the area of the Kano Plains; it is proposed to extend this to include geomorphological, hydrological and ecological data collection to provide the most up-to-date scientific information for regional planning.

II. Biological studies (proposed as Kenya's contribution to the IBP) preliminary data will be collected on three aspects of the ecology: a) productivity of fish in the lake shore region and the streams of the Kano Plains affected by migrations; this will be extended to include the fisheries potential productivity in the pilot irrigation scheme. b) the ecology of snails in the area. c) the ecology of mosquitoes, biting flies and other aquatic insects under water-logged and irrigation conditions - this survey to be correlated with current public health aspects already being studied.

III. Socio-economic problems - Experience in a pilot project has underlined the need for urgent investigation on both the immediate problems of attitude and impact of the far-reaching changes in the way of life of the people in the area outside the pilot scheme. The problem of population density and the impact of the change on existing traditional economy will be studied, including an inquiry into attitudes toward family planning.

SUPPORTED BY Rockefeller Foundation

3.0247, CORROSION AND MASS TRANSFER FROM CYLINDERS OF METALS ROTATING IN SEAWATER AT HIGH TEMPERATURES AND PRESSURES

J. MARANGOZIS, Univ. of Southwestern La., School of Engineering, Lafayette, Louisiana 70506

The purpose of the project is to measure and correlate the rates of corrosion of cylinders of such metals, as ferrous alloys, aluminum and aluminum-base alloys in seawater at temperatures up to 400 degrees F. and pressures up to 250 psia. It is proposed to use a high-pressure autoclave inside which cylindrical specimens of the metals are to be rotated under well-defined conditions of the most important independent variables, including fluid velocity, temperature, pH of solution, oxygen or carbon dioxide concentration, seawater composition, etc. It is expected that the experimental data, in conjunction with a mathematical analysis of rotational flow around cylinders in light of the boundary layer theory and the principles of ionic phenomena can lead into establishing quantitative relationships between the rates of corrosion and the pertinent variables.

3.0248, STUDY OF ORIENTED CELLULOSE MEMBRANES FOR REVERSE OSMOSIS AND THE RELATIONSHIP BETWEEN MORPHOLOGY AND SALT REJECTION

E. KLEIN, Gulf South Research Institute, New Orleans, Louisiana 70126

Cellulosic membranes having varying degrees of orientation and lateral order will be prepared on a continuous extrusion apparatus. The morphology of the membranes will be determined by deuterium oxide exchange measurements. The diffusion coefficient for water and NaCl will be measured in the membranes, as well as the solvent and solute partition coefficients between the membrane and aqueous salt solutions. Attempts will be made to correlate the morphology of the structures with the permeability of solvent and solute. Those membranes considered promising will be evaluated for reverse osmosis applications in desalination.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0249, THE USE OF NUCLEAR METHODS FOR DETERMINING FOREST SOIL SITE INDEX

J. KUPRIONIS, Louisiana Polytechnic Inst., School of Agriculture, Ruston, Louisiana 71270

Objectives: (1) To determine the values of nuclear methods to locate the depth, the surface, thickness and density of the least permeable layer of two forest soil profiles. (2) To determine the relationship of the data in (1) to water intake, runoff and water storage capacity of the soils. (3) To correlate data of (1) and (2) to an evaluation of site index.

Abstract of Procedure: A depth density gauge using cesium-137 as a source of gamma rays will be used to determine the depth

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

to, thickness of, and density of the least permeable layer of two forest soil profiles. Rainfall, runoff, and infiltration data from natural rainfall will be collected. These data will be analyzed, by computer programs to determine site index.

SUPPORTED BY U.S. Dept. of Agriculture

3.0250, LIGHTWEIGHT WATER PURIFICATION UNIT C.S. BARNHART, U.S. Army, Limited War Laboratory, Aberdeen Proving Ground, Maryland 21005

Tech Objective: To fabricate a lightweight, all-plastic still weighing less than six pounds when empty; which produces 1 to 2 quarts per hour of high quality distilled water from turbid, brackish or saline sources. The still will utilize locally available fuel.

Tech Approach: The boiler is a 6-inch diameter, 4-foot tube of fiber glass fabric impregnated with silicone rubber. When filled with water, the boiler can be heated directly in a wood fire. The water level in the boiler can be maintained by addition of raw water during operation through a specially designed filling valve. Distillate is condensed by air cooling, in plastic tubing. Filled lengths of condenser tubing can be tied and cut off for convenient transport of distillate.

Progress: The results of the Army evaluations were that even though the device did meet the technical objectives, tactical requirements in remote areas did not warrant use of this device. The task was then terminated.

SUPPORTED BY U.S. Dept. of Defense - Army

3.0251, REVERSE OSMOSIS WATER PURIFICATION C.S. BARNHART, U.S. Army, Limited War Laboratory, Aberdeen Proving Ground, Maryland 21005

Tech Objective: To obtain potable drinking water in the Delta region of RVN.

Tech Approach: To fabricate a lightweight unit using current state-of-the-art reverse osmosis techniques. In this process, water is forced under pressure through cellulose acetate membranes backed up with porous supports. The membranes are not filters or ultra-filters but function as osmosis in reverse. The water molecules pass through leaving behind salts and other particulate materials.

Progress: Two items were shipped to RVN for utilization by U. S. Forces in the Delta in April 1968. To date, no report has been received. The general characteristics of these units are: weight of unit- approximately 60 lbs; capacity - 100 gallon per day fresh water from highly saline sources. Water output: fuel ratio - 34 lb water per 1 lb fuel.

SUPPORTED BY U.S. Dept. of Defense - Army

3.0252, INDIVIDUAL WATER FILTRATION DEVICE H. ROSEN, U.S. Army, Limited War Laboratory, Aberdeen Proving Ground, Maryland 21005

Tech Objectives: To develop a water filtration device for individual use that will remove particles larger than 10 microns in diameter.

Tech Approach: The unit includes a piston-type pump by means of which water is drawn into a filter and forced through it. The filtered water is then collected directly in a standard one or two quart canteen to which the unit is attached. The filter does not remove bacteria.

Progress: An evaluation of this unit was accomplished in South East Asia during 1966. The results of this evaluation indicated that standardization for quantity procurement of this assembly was not desired and future requirements would only be of a special use nature. The task effort has been terminated.

SUPPORTED BY U.S. Dept. of Defense - Army

3.0253, DEVELOP A COMPUTERIZED METHODOLOGY FOR EVALUATION OF MUNICIPAL WATER CONSERVATION RESEARCH PROGRAMS N. GREENBERG, Hittman Associates Inc., Baltimore, Maryland

The proposed research will develop digital computer programs that will allow the computation of benefit-cost ratios for an array of proposed conservation alternatives for any given municipal area in the United States. The program will compute the overall benefit to the municipality in gallons of water saved by the adoption of conservation policies, attitudes, techniques, devices, or systems. The foundation for the proposed research will be the model now under development for OWRR which analyzes and defines the municipal water requirements as a 'consumption system' on a microscopic basis. That model will be extended and converted to allow the reflection of the impact of many conservation approaches simultaneously.

3.0254, THE ROLE OF BRITTLE SURFACE FILMS IN STRESS-CORROSION CRACKING J.A. GREEN, Martin Marietta Corporation, Baltimore - Middle River, Maryland

The basic aim of this project is to examine the proposal that stress-corrosion cracking proceeds by the repeated formation and rupture of brittle surface films. A major prediction of this 'brittle-film' model is that the rate of cracking is controlled by the rate of growth of the brittle film, and thus, to determine the validity of the model, studies are being undertaken to correlate these rates. ellipsometric technique has been employed to study rates of film growth on alphabrasses exposed to aqueous-ammonia solutions. The results provide strong support for the brittle-film model, both the rates of growth of the film (cuprous oxide) and the rates of cracking increasing markedly with increasing zinc content of the brass, increasing temperature, and anodic polarization. These studies are being extended to failures of a magnesium alloy, an austenitic stainless steel, and an alpha-titanium alloy in aqueous-chloride environments.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0255, THE ROLE OF BRITTLE SURFACE FILMS IN STRESS-CORROSION CRACKING E.N. PUGH, Martin Marietta Corporation, Baltimore - Middle River, Maryland

Objective: This research program is aimed at evaluating the role of brittle surface films in stress-corrosion failures occurring in aqueous chloride environments.

Scope of work: (a) Systems; (1) Austenitic Fe-20% Ni-20% Cr alloy exposed to aqueous 42% MgCl₂ at about 150 degrees C, (2) Single phase Mg-6% Al alloy exposed to aqueous solution of 40 g/l NaCl and 40 g/l K₂CrO₄ at room temperature.

(b) Stress-Corrosion Studies: Specimens taken from alloy will be axially loaded in tension while immersed in test solution, using conventional stress-corrosion equipment. Rates of cracking will be determined from these experiments.

(c) Electron-Microscope Studies: Replicas taken from the stress-corrosion fracture surfaces will be studied to determine whether discontinuous cracking has occurred. If the presence of this type of cracking is confirmed, measurements of the striations will be made to determine the thickness through which the crack propagated during each step. Electron-diffraction studies will be made in the microscope to determine the nature of the surface films. In addition, the nature of the films in the fracture surfaces will be investigated in situ by reflection electron diffraction.

(d) Ellipsometric Studies: Polished, unstressed specimens of the alloys will be exposed to the test solutions in the cell of an ellipsometer. Film growth will be allowed to proceed under conditions duplicating those of the stress-corrosion experiments, and the film thickness will be determined continuously. The film growth rates will be used with data from the electron-microscope studies to calculate rates of cracking for comparison with experimentally determined cracking rates.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3.0256, IMPROVED CULTURAL PRACTICES FOR PRODUCING SAFFLOWER UNDER IRRIGATED AND NON-IRRIGATED CONDITIONS

J.O. CULBERTSON, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To develop improved practices for producing safflower through research on crop sequence and rotation practices; fertilizer treatments; methods of tillage; date, rate, and method of planting; weed control; and other cultural practices.

Plan of work: Appropriate field plot techniques will be used in investigating and developing improved tillage and management practices under irrigated and non-irrigated conditions. Research will involve various combinations of fertilizer treatments, rates and dates of planting, irrigation practices, crop sequences, rotation practices, and methods of planting. Pre-emergence and, particularly, post emergence chemical weed control will receive attention in cooperation with State and Federal specialists. Studies will be made to evaluate selected chemicals in field plots and study effective dates and rates of application. The effects of various crop sequences, irrigation practices and methods of planting upon incidence and severity of disease and weed populations will be investigated. Various combinations of the above procedures will occupy one to several acres at Logan, Utah; Mitchell and Alliance, Nebraska; and Mesa, Arizona.

3.0257, IRRIGATION PRACTICES AND FACTORS AFFECTING THE WATER REQUIREMENT OF CROPS IN DIFFERENT LAND RESOURCE AREAS OF THE NORTHEAST

J. LUNIN, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To determine the consumptive use, water requirement and moisture extraction patterns of specific crop plants at various growth stages, to evaluate environmental factors affecting soil-water-plant relationships, and to integrate the information into efficient irrigation practices for various land resource areas.

Plan of Work: Laboratory, greenhouse and field work will be combined into an integrated program to develop new concepts of soil-water-plant interrelationships. Information is being obtained on factors affecting consumptive use of water at various plant growth stages, moisture extraction patterns of various crops, and effect of soil-water suction on water utilized by plants. Study will be made of (1) effect of climatic components on evapotranspirational losses so that existing climatic data can be used to estimate evapotranspiration and predict the need for irrigation, (2) criteria for development of efficient irrigation practices for specific crops, crop rotations and other management systems, and (3) efficiency of irrigation practices in terms of product quality and yield. Moisture retention and transmission characteristics of major benchmark soil types will be made.

SUPPORTED BY U.S. Dept. of Agriculture

3.0258, EFFECTS OF USING SALINE AND INDUSTRIAL WASTE ON YIELD AND QUALITY OF PLANTS

J. LUNIN, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To investigate the quality of brackish (saline) and industrial waste waters from various sources for supplemental irrigation application methods and frequencies and their effect on plant growth and soil physical-chemical properties.

Plan of Work: Field surveys will be made to characterize the quality of brackish and industrial waste waters, and their chemical composition determined. Field investigations where brackish water is used to irrigate vegetable and forage crops under field conditions will be studied to determine (1) the best methods and frequencies of irrigation, (2) salt accumulation as affected by irrigation and leaching by rainfall, and (3) salt tolerance of various crops. Greenhouse investigations will be carried out to determine soil-plant-water interrelationships as affected by salinity. This includes soil and solution culture studies to evaluate interactive effects between salinity and fertility, and levels of base saturation and growth state at time of salinization. Laboratory investigations will be made of cation exchange reactions in various soils at dif-

ferent levels of base saturation as affected by leaching with saline solutions followed by leaching with distilled water. The effect of these reactions on physical properties of the soil (permeability, modulus of rupture, bulk density, etc.) will be determined. Similar studies will be carried out using processing plant effluents.

Cooperation: Virginia Agricultural Experiment Station; SCS; U. S. Salinity Laboratory; Virginia Truck Experiment Stations.

SUPPORTED BY U.S. Dept. of Agriculture

3.0259, EFFECTS OF FERTILIZER AND SOIL MANAGEMENT PRACTICES, IRRIGATION, PLANT SPACING, AND OTHER CULTURAL TREATMENTS ON BERRY PRODUCTION

D.H. SCOTT, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To determine the effects of fertilizers and soil management practices, irrigation, plant spacing, and other cultural treatments on yield and quality of berries produced, particularly for newer varieties.

Plan of work: Work plans vary from year to year depending upon the kind of problem to be solved. Plants are usually grown in replicated plots and data obtained on characters such as fruit size, yield, time of ripening, disease ratings, and fruit quality in relation to various treatments. Nutrition, irrigation, mulching, chemicals for weed control, methods of propagation, and physiological responses of plants to temperature and photoperiod are investigated both in green houses and field plots.

SUPPORTED BY U.S. Dept. of Agriculture

3.0260, EFFECTS OF NUTRITION, CULTURAL PRACTICES AND WEATHER ON THE GROWTH, DEVELOPMENT, YIELD AND QUALITY OF CORN

G.F. SPRAGUE, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To study the absorption and use of different mineral elements by the plant and the distribution of these elements in different plant parts; the relation of environment and heredity to composition and quality; and the responses of corn plants and seeds to various environmental factors; and to determine the adaptability of new and improved corn strains to different cultural practices.

Plan of work: Inbred lines and hybrids in field plots and sub-irrigated gravel cultures will be compared to learn the differences in rate or total amount of absorption of various chemical elements and the distribution of these elements in the various plant parts. The physiological basis for differences in absorption or distribution observed will be established through laboratory studies. Corn seedlings and plants in the field, greenhouse and laboratory will be subjected to variations in light, temperature, moisture, nutrition and other agents and a determination made of the differences in strain reaction. The physiological basis for observed differences will be explored, and the possibility of increasing strain differences by selection determined. Different corn strains under different cultural and production practices will be compared to those on soils of different fertility and growth yield and quality of corn produced by the different methods measured.

3.0261, IMPROVEMENT IN CIGAR TOBACCOS BY DEVELOPMENT OF MORE ADEQUATE CROPPING SYSTEMS, FERTILIZATION, CULTURAL AND CURING PRACTICES

G.L. STEFFENS, U.S. Dept. of Agriculture, *Beltsville, Maryland*

Object: To improve the quality and yield of filler, binder and wrapper types of cigar tobaccos and to maintain economical production through adequate cropping systems, fertilization, cultural and curing practices.

Plan of work: Using accepted experimental design and field plot techniques research will be conducted to study cropping systems, crop handling practices including curing, additions to the soil of mineral, manure, and organic supplements as they are related to yield and quality of cigar filler and binder and wrapper types of leaf. Laboratory studies will be made upon leaf of known history from experimental plots with a view to arriving at a more

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

adequate basis for quality evaluation and relating the findings to improvement of the crop. In an effort to lower cost of production, it is necessary to adapt improved cultural practices suitable for automation, and also the application of growth regulators which do not result in undesirable effects. Treatments involving cropping sequence, fertilizers, cultural practices, and curing methods will be evaluated statistically so as to analyze the interaction among these variables. Other factors such as time and method of topping, suckering, irrigation, spacing, trans-varietal differences will also be studied.

SUPPORTED BY U.S. Dept. of Agriculture

3.0262, VARIETAL EVALUATIONS AND IMPROVED AGRONOMIC PRACTICES FOR SUGARBEETS

D. STEWART, U.S. Dept. of Agriculture, Beltsville, Maryland

Object: To evaluate hybrids and varieties of sugarbeets for regional adaptation, and develop agronomic practices for more efficient production.

Plan of work: Promising varieties and new developments in sugarbeet breeding research will be evaluated in regional programs of field trials that will be planned to sample soil types and weather conditions and appraise varietal tolerance to prevalent diseases. Hybrids, breeder seed, and other varietal developments in breeding will be screened and will involve disease tolerance, bolting resistance, sucrose percentage, size of root, etc. The most promising entries will be further evaluated in intensive tests to determine more precisely their regional adaptation. The interrelation of adapted varieties to regimes of spacing, fertilization, and plant populations will be studied in relation to quality and productivity. Crop sequence, plant residues, soil amendments, tillage, and irrigation will be studied in relation to the pathogenic flora and fauna as well as to quality and productivity. The influence of plant spacing along the row and distance between rows will be studied in relation to productivity weed control, and other field practices. The cultural studies will be aimed at developing field practices that will bring about a reduction in labor requirements with monogerm seed.

SUPPORTED BY U.S. Dept. of Agriculture

3.0263, PROTECTIVE FILMS FORMED BY PLASMA ANODIZATION

L.P. SKOLNICK, Univ. of Maryland, School of Engineering, College Park, Maryland

Surface coatings on aluminum and iron will be prepared by anodic oxidation by using oxygen ions formed in a glow discharge. Coatings formed in this way will be evaluated for their protection of aluminum and iron from corrosion in saline environments. In addition, the structure of oxides formed by plasma anodization will be compared to those formed by anodic reaction in an aqueous electrolyte.

The growth rate of the oxide film will be monitored in situ by optical means utilizing an ellipsometer. Impurities incorporated into oxides formed by aqueous anodization can be eliminated in plasma anodization since the composition of the electrolyte is a controlled variable in the latter case.

Aluminum oxide is thought to be non-protective in chloride environments because of pitting which occurs as the chloride ion replaces hydroxyl groups included in the film during formation in aqueous electrolytes. Due in part to its variable valence, formation of protective oxide coatings on iron introduces additional questions. However, if chemically pure films produced under the highly controlled conditions of plasma anodization behave differently from films formed in an aqueous environment, a better understanding of the passivation and anodic protection of both iron and aluminum will be achieved.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0264, DEVELOPMENT OF IMPROVED CELLULOSE ACETATE MEMBRANES FOR REVERSE OSMOSIS

B.M. RIGGLEMAN, Hercules Incorporated, Cumberland, Maryland

The objective of this program is to continue the development of composite hollow-fiber membranes for desalination by reverse osmosis and to demonstrate membrane performance in a laboratory hollow-fiber desalination module. Maximum performance in these composite membranes will be achieved by optimizing separately the membrane substrate and the selective layer.

The materials proposed for composite hollow-fiber membranes include crosslinked cellulose and cellulose triacetate. Substrates made of crosslinked cellulose are strong, compaction-resistant and solvent inert. Such substrates have been demonstrated in flat sheet membranes. For the selective layer, a thin film of cellulose triacetate (CTA) will be coated directly from dilute solution on to the substrate. The salt rejection of CTA is excellent; and, the resulting composite membrane should be acceptable for treating either brackish water or sea water.

Hollow-fiber membranes of cellulose-CTA will be prepared on the laboratory scale and evaluated in a laboratory module. The performance of the hollow-fiber membranes and module will be compared with state-of-the-art systems.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0265, THE MECHANISM FOR FORMATION OF A SKINNED TYPE MEMBRANE

R. BLOCH, Hydronautics Incorporated, Laurel, Maryland

It is proposed to study the mechanism of film formation in 'skinned' type cellulose acetate and other membranes by the following methods: (a) A quantitative analytical study of the rate processes occurring during skin formation such as, evaporation rate, diffusion rates of solvent into water and water into casting solution. (b) A study of phase separation in multi-component systems by the application of Flory's theory of phase separation for binary mixtures, to ternary and quaternary systems. (c) The measurements of polymer-solvent interaction parameters of various polymer-solvent systems by osmotic or light scattering methods. Primarily these will be determined for cellulose acetate in acetic acid, dimethyl formamide and triethyl phosphate. (d) An experimental study of rate processes under controlled conditions, e.g., evaporation rates will be varied by allowing evaporation into a chamber of controlled vapor pressure of the solvent. (e) A correlation between degree of skinning and the polymer-solvent interaction parameter for a number of solvents.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0266, RESEARCH ON HIGH-EFFICIENCY COMBINED EVAPORATIVE AND CONDENSATIVE HEAT TRANSFER SYSTEM

C.E. BROWN, Hydronautics Incorporated, Laurel, Maryland

The purpose of the research project is to provide understanding and design information on heat transfer systems in which surface tension phenomena are exploited to provide high overall heat transfer coefficients. Most systems studied have shown good results with pure water or condensing steam, but there is usually an inherent tendency for the evaporator using sea water to polarize sharply, thus offsetting the desired high efficiency for heat transfer. Furthermore, since cost per pound of water evaporated is a paramount factor, the attainment of high heat transfer efficiency should go hand-in-hand with surfaces and surface preparations which can be produced at low cost. The work in progress at HYDRONAUTICS, Incorporated has as one of its goals the attainment of high heat transfer coefficients by making use of the surface tension and surface tension gradients which occur on three dimensional evaporating films of sea water. The goal is constrained to metals and configurations which offer promise of being inexpensive in both initial cost and maintenance. Present efforts are primarily being expended on extremely thin, flat Titanium foils on which a pattern of Teflon or other non-wetting material is used to produce controlled rivulet flow.

3.0267, STUDY OF THE HYDRODYNAMIC ASPECTS OF DESALINATION BY REVERSE OSMOSIS

M.P. TULIN, Hydronautics Incorporated, Laurel, Maryland

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The general aim of the proposed research program is to accelerate the engineering development of reverse osmosis techniques for the desalination of water. Specifically it is planned to devise and develop methods for the determination of intrinsic membrane characteristics to suggest and investigate different geometrical configurations and hydrodynamic conditions which may enhance depolarization and to analyze different reverse osmosis systems from an economical point of view.

Analytical and experimental studies will be undertaken to further these aims. Suitable apparatus will be developed for membrane characterization. Experimental investigations will be carried out in specially designed equipment, to study practical and desirable ways and means of depolarization and decantation of the polarization layer.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0268, HYDROFORMING REVERSE OSMOSIS MEMBRANES AND A DESALTING MODULE BASED ON THE HYDROFORMING PROCESS

M.P. TULIN, Hydronautics Incorporated, Laurel, Maryland

It is proposed to produce reversed osmosis tube assemblies by a process of hydroforming, in which a cellulose acetate membrane is formed directly within a suitable porous support tube. This is accomplished by forcing a cellulose acetate solution in acetone plug through the support tube by means of a gas column followed by a cold water column. Under proper conditions, a membrane is deposited on the support tube wall with a controllable thickness over a great length.

The optimum conditions of hydroformation will be determined and the operating characteristics of the tube assembly measured.

A small desalination module based on such hydroformed tubes will be built and operated.

It is further intended to develop a membrane regeneration procedure, in which inoperative or fouled membranes can be dissolved from the assembled tube system, and reformed in place without dismantling the system.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0269, MODIFICATION OF PROTEIN FILMS FOR USE IN DESALINATION

B.S. FISHER, Gillette Research Institute, Rockville, Maryland 20850 (14-01-0001-1811)

The over-all objective is to relate the physical structure and chemical constitution of modified protein films to their performance as reverse osmosis and pressure dialysis membranes. A variety of films of well defined structure and constitution will be examined in order to develop a rationale that will lead to novel improved practical membranes for desalination processes. Proteins such as zein, collagen and casein, possessing suitable solubility characteristics and exhibiting the ability to form certain selected membrane configurations will be selected for study. Preferred forms of the proteins (e.g., supported ultrathin films, unsupported films, tubing) will be prepared and suitably modified, to impart water insolubility and adequate wet strength. Such modification will include crosslinking and/or incorporation of hydrophobic end-capping groups onto the free amino groups of the protein. The intrinsic permeability properties to water, salt and other selected solutes will be determined with these films by simple osmosis experiments. Further modifications of the films by either physical processes (e.g., orientation) and/or chemical processes, such as impregnation with vinyl polymers via graft polymerization or in situ deposition from the monomer, will be carried out to impart desired permeability characteristics. The production of skinned or asymmetric membranes by this technique will be investigated. Specimens of the most promising materials found in this study will be submitted to the Office of Saline Water for evaluation in reverse osmosis or pressure dialysis tests.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0270, PARAMETRIC ECONOMIC AND ENGINEERING EVALUATION STUDY OF THE ELECTRODIALYSIS PROCESS

B.J. TRIJETT, Booz Allen Applied Res. Inc., Washington - Bethesda, Maryland

This study was undertaken to perform an economic and engineering evaluation of electrodialysis processes for desalting brackish waters. The major emphasis in the investigation will be on determining the most promising one of three basic stack designs for scale-up to large plant sizes. During this evaluation, plant performance parameters for each plant type that have major effect on water costs will be identified, and the susceptibility of each plant type to improvements will be examined.

3.0271, DISTRIBUTION AND ABUNDANCE OF JUVENILE AMERICAN SHAD, ALOSA SAPIDISSIMA (WILSON), IN THE CONNECTICUT RIVER ABOVE HOLYOKE DAM, MASSACHUSETTS

J.A. MCCANN, Univ. of Massachusetts, Mass Cooperative Fishery Unit, Amherst, Massachusetts 01002

The recreational potential of the Connecticut River is now being evaluated by local, state and federal agencies. There have been several committees established to study the feasibility of extending the spawning runs of American shad and Atlantic salmon to their historical sites. The construction of a fish lift at the Holyoke Dam in 1955 increased the shad spawning migration by 32 river miles. In recent years, the Massachusetts Division of Fisheries and Game have stocked viable shad eggs above Turners and Vernon dams.

A doctoral study was initiated to: (1) estimate the population of juvenile shad in relation to the Holyoke Dam, Massachusetts, by marking throughout the field season with fin clips, brands, or some other method that does not cause excessive mortality; (2) estimate the mortality of juvenile shad in the study area by marking and recapture; (3) determine when migration occurs by weekly or bimonthly quantitative sampling in the Holyoke Canal System; (4) determine depth, speed, and other factors associated with migration by temporary marking with Neutral Red or Bismark Brown Y for short term mark and recapture.

3.0273, A STUDY OF PRESSURE DIALYSIS AND COUPLING PHENOMENA IN SYNTHETIC AND NATURAL MEMBRANES

S.R. CAPLAN, Harvard University, School of Medicine, Boston, Massachusetts

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

A proposal is submitted for the study of the structural basis of coupling between different flows, and between flows and chemical reactions, in well-characterized synthetic membranes. The proposal incorporates three closely related topics:

1. flow in hyperfiltration membranes, and of the mechanism of 'salt rejection'. 2. The preparation and study, by similar methods, of fine-grained mosaic membranes, in which salt transport should be characterized by large negative values of the reflection coefficient. 3. The preparation and study, partly by similar methods, of membranes containing asymmetric arrangements of bound enzymes. In membranes of this kind coupling can occur between enzymic reactions and solute flows.

The theoretical framework on which the design and analysis of the experiments will be based includes primarily the treatment of membrane transport given by Kedem and Katchalsky, and the treatment of coupling given by Kedem and Caplan. The methods to be used in studying hyperfiltration membranes will be essentially those developed by Solomon and co-workers in the study of water flow across the human erythrocyte membrane.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0274, DEVELOPMENT OF A WATER DESALINATION SYSTEM BASED ON HOLLOW FINE FIBER MEMBRANES *R.S. TIMMINS, Abcor Incorporated, Cambridge, Massachusetts 02139*

This contract outlines a program to demonstrate the advantages of using hollow fine fibers in reverse osmosis processes, to develop engineering information on their use in a reverse osmosis unit, and to construct a pilot plant capable of producing 1,000 gallons per day of purified water. A preliminary design for the utilization of fine fibers has been developed which provides particular advantages because of the fiber's efficient mass transfer, small size, low cost and freedom from fouling. Use of several different fiber sizes will be evaluated to select the best geometry for the unit. Cellulose acetate has been chosen as the basis for this design and will receive major attention because of its proven effectiveness in desalination work. A limited number of other materials which may offer particular advantages in fine hollow fibers will be evaluated. Examination will be made of a number of important operating problems such as feed pretreatment and membrane life.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0275, EVALUATION OF EXISTING AND UNCONVENTIONAL MEANS FOR PUMPING AND ENERGY RECOVERY IN A REVERSE OSMOSIS DESALINATION PLANT

E.J. FAHIMIAN, Dynatech Corporation, Cambridge, Massachusetts

The objective of this study is to perform economic analyses of pump and energy recovery units, potentially useful in reverse osmosis plants. Due to the large flows of high-pressure salt water needed, currently proposed systems require a large capital investment for the high-pressure pump. Furthermore, since a large fraction of the high-pressure water is rejected as concentrated brine, it might be economical to use a hydraulic turbine to recover part of the energy. Because current knowledge of pumps and turbines suitable for application in large size reverse osmosis plants is incomplete (data on the performance, cost, availability and reliability of these units are lacking), technical and cost information on existing pumps and turbines is being used together with information supplied by manufacturers to develop scaling relations describing cost and performance of large scale units. Similar information is being developed for potentially promising unconventional means for performing pumping and energy recovery. These scaling relations are then to be used in an optimization model of a complete reverse osmosis plant to study the influence of variations in pump and turbine size and performance on the cost of desalting water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0276, JET-PUMP TOPPING-UNIT PILOT PLANT

E.F. KURTZ, J. Kaye & Company Inc., Cambridge, Massachusetts 02138

A jet-pump topping unit is a means for improving the thermal efficiency of small to medium sized distillation desalination plants. The topping unit consists basically of a vapor-compression evaporator utilizing an ejector as the vapor compressor. The ejector is driven by high-temperature water from a boiler. Low temperature steam from the ejector exhaust is used to drive the distillation plant.

A pilot-plant jet-pump topping unit will be constructed at the OSW Test Station at Wrightsville Beach, N. C. This topping unit will utilize a multiple-phase ejector developed by Joseph Kaye & Company under OSW Contract 14-01-0001-429. The topping-unit-vapor-compression evaporator will produce approximately 5000 lb/hr of distillate, and 2000 lb/hr of 265°F steam from ejector exhaust will drive a 5-stage vertical-tube evaporator to produce approximately 10,000 lb/hr of distillate. The total heat requirement will be approximately 150 Btu/lb of distillate.

3.0279, COUNTERWASHERS FOR FREEZE-DISTILLATION DESALINATION

R.F. PROBSTEIN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

To develop from a hydrodynamic point of view a theoretical and experimental understanding of counterwashers of the type used in washing brine from ice crystals in order to determine criteria for the design and construction of higher performance columns than presently exist. Preliminary hydrodynamic studies, based on Darcy's Law, have been applied to the calculation of the displacement of the brine by fresh water from the interstices of the ice plug formed in the column. Theory indicates the main difficulty in obtaining large net production rates of fresh water in the counterwasher results from the fact that large quantities of brine

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

must be discharged through the screens and before reaching the screens this brine must flow through the packed ice bed which presents a large resistance to the flow. The production rate is found to increase with decreasing the ice plug length below the screens and the back pressure at the screens, and increasing ice crystal size, pressure at bottom of plug, the wall friction. Experiments on a simulated counterwasher will be carried out with polyethylene beads and ice crystals to investigate the effects predicted. The theory will also be extended to determine an optimum design counterwasher from economic and dynamic considerations.

3.0280, THE ELECTROHYDRODYNAMICS OF ELECTRODIALYSIS SYSTEMS

R.F. PROBSTEIN, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

The objective of the proposed work is to develop from an electrohydrodynamic point of view a theoretical and experimental understanding of the electrodialysis process for saline water conversion. In the present research the properties of the membranes will be taken to be given and the objective will be to determine theoretically and experimentally the potential, concentration, and flow field distributions as well as the appropriate scaling and similarity parameters. The theoretical distributions will be determined for different geometrical and flow conditions and will take into account effects of water dissociation, several ionic species, finite thickness and partially selective membranes, as well as unsteady operating conditions. Based on the scaling and similarity parameters obtained from the theoretical work laboratory scale electrodialysis cells will be investigated with the aim of measuring both overall flow and field quantities as well as detailed potential and concentration distributions which may then be compared with the theoretical results. An important feature of the work will be to show the need to take into account the developing nature with distance along the channels of the electric and concentration field distributions as well as their spatial interactions. On the basis of the results obtained an appropriate redesign of electrodialysis units for more efficient and economical operation will be undertaken both theoretically and in the laboratory.

3.0282, EFFECT OF ELECTROCHEMICAL AND METALLURGICAL FACTORS ON CORROSION OF METALS AND ALLOYS

H.H. UHLIG, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

The direction of the present research is toward making available accurately determined data, combined with a reasonable explanation of mechanism regarding corrosion of metals and alloys in aqueous media including saline solutions. Factors are being studied which account for pitting corrosion of passive alloys such as the stainless steels in chloride media. For example, critical potentials of 18-8 stainless steels are being measured below which pitting corrosion does not occur. The effect of environment on such potentials has been studied by us in some depth.

The current program is focussed on corresponding metallurgical factors. For example, chromium, nickel, molybdenum and cobalt, both as binary alloys and as alloying constituents of stain-

less steels, are being studied with regard to their critical potentials and pitting behavior. Alloys inherently more corrosion resistant on exposure to saline solutions can be expected from data of this kind.

Some measurements are also under way on the general corrosion rates of iron in deaerated water and NaCl solutions. The purpose is to better understand the metallurgical factors that affect corrosion rates in these environments. Supplementary to these studies are measurements of passivity both in the region of potentials where pitting does not occur and in media which do not produce pitting corrosion at any potential.

3.0283, EFFECT OF ELECTROCHEMICAL AND METALLURGICAL FACTORS ON CORROSION OF METALS AND ALLOYS

H.H. UHLIG, Mass. Inst. of Technology, School of Engineering, Cambridge, Massachusetts 02139

The direction of the present research is toward making available accurately determined data, combined with a reasonable explanation of mechanism, regarding corrosion of metals and alloys in aqueous media including saline solutions. Factors are being studied which account for pitting corrosion of passive alloys such as the stainless steels in chloride media. For example, critical potentials of 18-8 stainless steels are being measured below which pitting corrosion does not occur. The effect of environment on such potentials has been studied by us in some depth.

The current program is focussed on corresponding metallurgical factors. For example, chromium, nickel, molybdenum and cobalt, both as binary alloys and as alloying constituents of stainless steels, are being studied with regard to their critical potentials and pitting behavior. Alloys inherently more corrosion resistant on exposure to saline solutions can be expected from data of this kind.

Some measurements are also under way on the general corrosion rates of iron in deaerated water and NaCl solutions. The purpose is to better understand the metallurgical factors that affect corrosion rates in these environments. Supplementary to these studies are measurements of passivity both in the region of potentials where pitting does not occur and in media which do not produce pitting corrosion at any potential.

3.0284, BASIC STUDIES OF SCALE CONTROL

B.M. FABUSS, Monsanto Research Corporation, Everett, Massachusetts 02149

The objective of the project is to conduct laboratory investigations to obtain basic information on the slurry seeding process for control of calcium sulfate scaling from saline water concentrates. The effects of such factors as temperature, crystal size, composition and concentration, fluid dynamics, supersaturation, heat flux, fluidized or fixed bed on calcium sulfate precipitation will be determined.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0285, CONCEPTUAL DESIGN STUDY FOR ELECTRODIALYSIS

B.M. FABUSS, Monsanto Research Corporation, Everett, Massachusetts 02149

The proposed work of this contract is to carry out a six-month technical and economic evaluation of presently available electrodialysis installations and to develop and evaluate several new concepts. The primary goals to be attainable by the utilization of these innovations are: (1) an increase in effective membrane surface per unit geometrical area; (2) the reduction of resistance path by changes of fluid flow pattern; and (3) the elimination of separate gaskets and spacers to provide more complete membrane utilization and reduce membrane and labor costs.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0286, THERMOPHYSICAL PROPERTIES OF SEA WATER AND AQUEOUS ELECTROLYTE SOLUTIONS CONTAINING NaCl, KCl, Na₂SO₄, AND MgSO₄

A. KOROSI, Monsanto Research Corporation, Everett, Massachusetts 02149

Property values on the major sea water components NaCl, KCl, Na₂SO₄, and MgSO₄ in their binary and ternary solutions and those on sea water and its concentrates will be presented in tabular form. The correlated data were derived from the author's measurements and were compared with other sources. The values to be tabulated include: Density, vapor pressure, boiling point elevation, viscosity, and thermal conductivity, given in cgs and engineering units with such frequency that linear interpolation will become permissible.

The concentration of salt solution in most cases will cover 0.1- 3.5 ionic strength levels in the temperature range of 20-150 degrees Centigrade. Sample calculations, the correlation technique used and a computer program applicable for sea water will be included.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0287, CONTROL OF CONCENTRATION POLARIZATION IN REVERSE OSMOSIS DESALINATION OF WATER

B. KEILIN, Amicon Corporation, Lexington, Massachusetts 02173

In the purification of water by reverse osmosis, a concentrated saline layer is formed at the membrane surface, reducing membrane efficiency and life. This concentration is reduced by inducing turbulent flow with high feed velocities and baffles--at high cost in power. The greater the membrane flux, the greater the cost.

The possibility that laminar flow in short, thin channels, could give high yields at low power cost was verified in OSW Contract No. 14-01-0001-965 in a 7-inch cell at Amicon Corporation.

Concentration polarization will now be determined for the entrance, fully-developed flow and exit regions for turbulent, laminar and intermediate flow regimes in one 30-inch long cell with variable channel height. Experimental results will be compared with predictions from theory for each type of flow and each region. Earlier work, indicating that the effects of membrane roughness and maldistribution of flow along the channel would be less critical in laminar than turbulent flow, will be extended. Practical means of forming thin, laminar flow channels between the membranes will also be investigated.

These studies will provide preliminary information for the design of a pilot reverse osmosis unit that would minimize concentration polarization effects at capital and operating costs.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0288, INVESTIGATION OF ANOMALOUS WATER

B.M. FABUSS, Lowell Technological Institute, Graduate School, Lowell, Massachusetts 01854

Although several theories and models have been proposed for the explanation of water properties, only most recently Academician B. V. Deryagin in the Physico-Chemical Institute of USSR Academy of Sciences prepared anomalous water. This water was formed by condensing water vapor in thin quartz capillaries. The anomalous water shows different properties, vapor pressure, density, expansion coefficient, viscosity and phase changes from those of regular water. The aim of the present work is to reproduce and confirm these observations and to develop techniques for producing anomalous water in larger quantities, thus permitting a more detailed investigation of its properties.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0289, MODIFIED ION-EXCHANGE MEMBRANES FOR WATER PURIFICATION BY REVERSE OSMOSIS

R.B. HODGDON, General Electric Company, Lynn - West Lynn, Massachusetts

The objective of this contract is to develop modified ion-exchange membranes having flux and salt rejection properties comparable to cellulose acetate for reverse osmosis application. The primary emphasis will be placed on developing materials and methods for the preparation of thin films resistant to compaction in high pressure reverse osmosis desalting environments. The two phases of work proposed are the thin film preparation and evaluation, and the preparation and evaluation of thin film composites.

3.0290, DEVELOPMENT OF LOW-COST, CORROSION-RESISTANT ALLOYS AND ON ELECTRO-CHEMICAL TECHNIQUES FOR THEIR PROTECTION IN DESALINATION SYSTEMS

A.C. MAKRIDES, Tyco Laboratories Incorporated, Waltham, Massachusetts

A series of alloys, based on the copper-zinc system, and electro-chemical methods for their protection will be developed. The new alloys will hopefully have lower cost, greater strength, better thermal conductivity, and better corrosion resistance than do current available materials. The experimental program includes:

(1) A systematic evaluation of the effect of incremental changes in minor alloying constituents, including P, As, Sb, Si, Ge, Sn, Pb, Fe, and Ni, on the properties of the Cu-Zn system.

(2) A systematic determination of the high temperature corrosion properties of available commercial materials, including 90:10 cupro-nickel, 70:30 cupro nickel, aluminum brass, arsenical Admiralty brass, and Naval brass, and of experimental alloys produced under the program. Both polarization measurements and weight loss techniques will be utilized.

(3) The evaluation of electrochemical corrosion protection techniques, particularly of anodic protection, both for experimental alloys and for commercial materials.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0291, RESEARCH ON PIEZODIALYSIS

W.A. MCRAE, Ionics Incorporated, Watertown, Massachusetts (14-01-0001-611)

The objective of research performed to date was the determination of the practicality of desalination by the coupled transport process 'Piezodialysis' utilizing fine-grained mosaic membranes, comprised of alternating patterns of anion and cation selective regions having characteristic dimensions of about 10 microns. The Scope of Work is amended by the addition of the following tasks:

a. Improve flexibility of the resins utilized in the fabrication of the sheet piezodialysis membranes.

b. Establish technology for fabricating piezodialysis membranes having an active thickness of 1 micron.

c. Investigate the use of porous metal supports for the membranes to meet the requirement of 50% or greater stable porosity at 100 atmospheres pressure.

d. Investigate the use of hollow fibers which are cationic along half the circumference and anionic along the other half.

e. Performance tests will be made with the thin planar membranes, improved support materials and the fine tubular membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0292, THE KINETICS OF COMPRESSIBILITY EFFECTS IN TWO PHASE SINGLE COMPONENT FLOW

C.L. FELDMAN, Worcester Polytechnic Inst., School of Engineering, Worcester, Massachusetts 01609

This project is an investigation of the compressibility effects in single component two phase flow with the primary emphasis being on the kinetics of these compressibility effects. The investigation has as its primary goal a quantitative understanding of the rates of various physical reactions in a two phase fluid when it is perturbed from its equilibrium state. A knowledge of these reaction rates will then permit rational design of high performance two phase flow equipment. A secondary goal of the program will be the development of measurement techniques for general application to two phase flow work.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The fundamental experimental technique will be an extension of Mikol's method for obtaining an equilibrium low velocity two phase flow of known quality. Sonic velocity will be measured as a function of input frequency. Water will be used as a working fluid and the temperature varied from 80F to 300F. Emphasis will be on the low quality region and the sound absorption spectrum will be used as a measure of bubble size.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0293, STUDIES OF FUNDAMENTAL MECHANISMS IN THE DEPOSITION OF CALCIUM SULFATE SCALE
J.L. YORK, Univ. of Michigan, School of Engineering, Ann Arbor, Michigan

This fellowship grant supports doctoral research of three graduate students.

One study is on phase-transition kinetics for hydrates of calcium sulfate in water and brine solutions. The transformation from selenite to hemi-hydrate is the principal study, and others will be also investigated. Sensitive dilatometric measurements and microscopic observation are simultaneously employed.

Another study is on heterogeneous nucleation of calcium sulfate on metallic surfaces from aqueous solutions. Both electrical conductivity and electron microscope observations are employed.

A third study is on homogeneous nucleation of calcium sulfate from aqueous solutions. Filtered clear solutions in suspension in heavy oil are subjected to temperature changes and the drops are observed microscopically to study nucleation in the absence of nucleating solids.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0294, BOG AND SWAMP HYDROLOGY

R.R. BAY, U.S. Dept. of Agriculture, Forest Service, Grand Rapids, Michigan

Object: To develop management practices, through basic hydrologic studies, which will maintain and improve water yield including streamflow timing characteristics, water quality, low-flow augmentation, and total ground water recharge on northern forested peat lands.

Plan of work: The project staff is continuing to gather information on (1) the hydrology of forested bog watersheds while calibrating experimental watersheds, (2) physical properties and water transmissivity of organic soils, and (3) evapotranspiration rates of bog vegetation. They will begin studies on effect of timber management and water control practices on (1) water yield and groundwater recharge, (2) evapotranspiration, water storage, and changes in the properties of organic soils. They will also determine the energy balance regimes in peatlands and other bog-vegetation complexes.

SUPPORTED BY U.S. Dept. of Agriculture

3.0295, A STUDY OF THE DISPOSAL OF THE EFFLUENT FROM A LARGE DESALINATION PLANT

W.F. MCILHENNY, Dow Chemical Company, Midland, Michigan

Preparation of a Handbook for Engineers to use in selecting shore sites for installation of large desalination-power plants. Includes considerations of oceanographic and meteorologic factors involved in plant protection. Discusses biological systems that one should take cognizance of in designing water intake and discharge units. Indicates the tolerances of key marine organisms for heat, salinity, copper concentrations, etc. that will be important factors in the effluent. Report will cover sites selected as actual or potential water-shortage regions on all coasts of the U. S., as well as one site in Mexico.

Analyze copper in effluent streams from existing desalt plants; determine chemistry and fate of copper in effluents diluted in the environmental sea water; and investigate methods of removing copper from effluent.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0296, DEEP WELL DISPOSAL OF DESALINATION BRINE WASTES

W.F. MCILHENNY, Dow Chemical Company, Midland, Michigan

Collect and correlate the geological factors, techniques and costs of deep well injection.

Collect and review brine and brackish water resources for desalination and compute waste compositions.

Survey legal aspects of deep well injection.

Analyze the designs and projected costs of deep well disposal in five representative communities.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0297, PREPARE AN OPERATIONAL PLAN, CONCEPTUAL DESIGN AND PLANS AND SPECIFICATIONS FOR A SEAWATER CORROSION TEST FACILITY

O. OSBORN, Dow Chemical Company, Midland, Michigan (14-01-0001-1139)

It is proposed to establish a Materials Test Center adjacent to the Freeport Test Bed where land, sea water, utilities, and technical services from nearby industry are readily available. (The Center would ultimately house a staff of engineers and scientists with assigned responsibilities to find more economical materials of construction for desalination plants. The physical facilities would consist of administrative offices, a capability of operating some ten environmental test units, and the needed support services such as analytical and metallurgical laboratories and a repair shop. Some 14,000 square feet of working space would ultimately be required.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0298, RESEARCH AND DEVELOPMENT OF ULTRATHIN FILM MEMBRANES FOR REVERSE OSMOSIS DESALINATION

L.T. ROZELLE, North Star Res. & Dev. Inst., Minneapolis, Minnesota

The overall goal of this project is to develop ultrathin membranes (1000 to 2000 angstroms in thickness) for the desalination of water by reverse osmosis under test conditions for both sea water and brackish water.

A major objective is to apply ultrathin membranes to a tubular configuration for reverse osmosis. Casting studies using cellulose acetate (CA) will include drawing a module through (1) a membrane on a water surface and (2) a pool of polymer solution on a water surface. Deposition from an emulsion will also be studied. Reverse osmosis studies will be carried out to evaluate the ultrathin membranes and to indicate the research necessary to achieve optimum performance. Various support materials will be investigated. Preliminary studies will be carried out for evaluation of the ultrathin membrane module in an in situ regeneration process.

Another major objective is to optimize the reverse osmosis performance and characterize ultrathin CA membranes. The optimization parameters include membrane thickness, acetyl content, and degree of annealing. Membranes will be characterized by microscopy, intrinsic viscosity, infrared spectroscopy, and compressive property techniques.

One minor objective will be to optimize anisotropic membranes of beta glucan acetate and CA as compared to the Loeb and Manjikian membranes. The other objective will be to test readily available commercial polymers as ultrathin membranes for reverse osmosis.

3.0299, ELECTRIC FIELDS IN THE CONDENSATION AND COALESCENCE OF WATER

G.D. FREIER, Univ. of Minnesota, Graduate School, Minneapolis, Minnesota 55455

The general objective of this work is to relate precipitation and atmospheric electrical phenomena. To accomplish this goal

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

an experimental program has been designed to observe some of the phenomena.

One of the experiments is designed to show that the rapid formation and subsequent rupturing of water surfaces produces many high mobility ions that can increase the air's conductivity. Another is designed to indicate that a limited current flow through a medium containing many small droplets will cause the droplets to disappear rapidly.

In order to gain insight into the above experiments, a light scattering technique will be used. The technique will consist of white light as well as alternate pulses of red and blue light. The split beams will pass through a strong electrical field in an expansion chamber. Measurements will be made of the transmission as well as of the temperature of the chamber in which the experiment takes place.

A study will be undertaken of nucleation centers using a spark gap in the pumping lines and a pair of expansion columns. Finally, a study will be made of the relations between electric fields and the condensation process using a small probe that gives an A-C signal proportional to the D-C field.

SUPPORTED BY U.S. National Science Foundation

3.0300, CHARACTERISTICS OF FARM ANIMAL MANURES AFFECTING DESIGN OF DISPOSAL FACILITIES

R.E. LARSON, Univ. of Minnesota, Agricultural Experiment Sta., Saint Paul, Minnesota

Object: To identify and evaluate those physical and biological characteristics of farm animal manures that serve as criteria for the engineering design of economical and sanitary disposal facilities.

Plan of Work: This work will be carried out principally in the laboratory. Samples of the various manures will be obtained, cataloged, weighed, and analyzed for the various characteristics under investigation. Samples will be collected from the various livestock research farms of the University of Maryland, ARC at Beltsville, and from operating farms in the vicinity. Analyses will be in accordance with procedures in the current edition of Standard Methods for the Examination of Water and Wastewater or other accepted techniques. Special apparatus and instrumentation for determinations of soil sealing rates, sludge accumulation rates, and certain other factors will be devised and fabricated as needed.

SUPPORTED BY U.S. Dept. of Agriculture

3.0301, EFFECT OF FOREST TYPES AND CONDITIONS ON WATER MOVEMENT AND GROUND WATER RECHARGE

S.J. URSIC, U.S. Dept. of Agriculture, Oxford, Mississippi

Object: To determine the effect of soil, forest cover, and forest management on streamflow and ground-water recharge.

Plan of work: Twelve natural runoff plots are instrumented to measure hydrologic events and determine changes caused by forest manipulation. The staff is collecting and evaluating existing information on watershed soils and ground-water geology of the problem area. They are determining various components of the hydrologic cycle, such as infiltration rates, interception amounts, and deep seepage.

SUPPORTED BY U.S. Dept. of Agriculture

3.0302, DEVELOPING RESERVOIRS FOR SUPPLEMENTAL IRRIGATION

E.A. KIMBROUGH, Mississippi St. University, Agricultural Experiment Sta., State College, Mississippi 39762

To investigate various methods of construction and/or repair to prevent seepage losses from reservoirs used for irrigation. To investigate the use of chemicals and other imported materials in the construction and/or repair of reservoirs to decrease seepage losses.

DESCRIPTION OF WORK - Typical reservoir sites with the problem of highly permeable soil strata will be selected for the construction of test reservoirs or repair reservoirs which have ex-

cessive losses. New test reservoirs will have a water surface of 1/3 acre when filled to the maximum depth. Methods of construction will include bulldozer, sheep foot roller, clay products sealing, and other imported materials that may be selected.

Water level recorders will be used to measure volume changes. Off-stream reservoirs of approximately 5 to 15 acre feet will be constructed to determine the effect of the higher hydraulic heads on the seepage losses. These reservoirs will be used for irrigation to determine problem associated with this type reservoir.

Mississippi State Government

3.0303, NITROGEN REQUIREMENT FOR SKIP-ROW COTTON

W.I. SPURGEON, Mississippi St. University, Agricultural Experiment Sta., Stoneville, Mississippi

Objective: 1. To determine the quantity of nitrogen required for skip-row cotton where it is planted on previously fallowed skips.

Working Procedure: Field tests will be conducted using plant-4-fallow-4, plant-2-fallow-4 and a combination of plant-2-fallow-2 plus plant-2-fallow-4 as the main plots. Each main plot will be split with 4 rates of nitrogen -- 0, 60, 80, 100 pounds per acre. All treatments will be replicated 4 times.

SUPPORTED BY Mississippi State Government

3.0304, DISTRIBUTION, APPLICATION AND USE OF WATER

C.F. CROMWELL, Univ. of Missouri, Agricultural Experiment Sta., Columbia, Missouri 65202

Study problems related to obtaining suitable water supplies for irrigation. Study different methods develop engineering design data, and improve techniques for applying irrigation water. Determine rate of moisture use of different crops under various levels of available soil moisture, and the distribution of moisture removal from various zones in the soil profile.

DESCRIPTION OF WORK - Two or more irrigation water supply wells will be developed for the Southeast Missouri Research Center at Portageville, Missouri. Records of soil stratification, development method, cost, and water yields will be kept.

Plots will be graded for irrigation studies. Records will be kept of equipment time. Comparisons will be made between crawler and rubber-tired prime movers.

Laboratory tests will be conducted to determine hydraulic parameters of flow in a model irrigation furrow. A range of roughness factors including several agricultural soils will be tested. An artificial intake rate will be applied beneath the material bed using ceramic tubes and a vacuum pump.

Intake rates of additional soil profiles will be determined in a vertical model.

SUPPORTED BY U.S. Dept. of Agriculture
Missouri State Government

3.0305, AN EXPERIMENTAL STUDY OF THE STRUCTURE, THERMODYNAMICS, AND KINETIC BEHAVIOR OF WATER

F.T. GREENE, Midwest Research Institute, Kansas City, Missouri

The proposed work involves the measurement of the equilibrium thermodynamic properties and rates of formation of clusters of water and other model compounds. The equilibrium studies will involve the measurement of the equilibrium cluster concentrations as a function of temperature using both molecular effusion and high pressure mass spectrometric sampling techniques. These data will yield heats of formation, free energies of formation, and bond strengths, which will in turn be interpreted in terms of their implications to intermolecular potential energy functions, nucleation theory and liquid structure. Rates of cluster formation will be studied by expanding appropriate gases and gas mixtures as a free jet, which is then sampled into the mass spectrometer. From the known free jet temperature-pressure history and the measured cluster concentrations, the rates of formation of the clusters can be evaluated.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0306, CORRELATION OF ANOMALOUS ULTRASONIC REFLECTIVITY WITH EARLY SCALE FORMATION
F.R. ROLLINS, Midwest Research Institute, Kansas City, Missouri

Recent research on ultrasonic reflectivity at liquid-solid boundaries has revealed some rather anomalous effects that occur when the angle of incidence is such that surface waves are excited at the boundary. These anomalous reflection effects often change significantly with minor variations in physical properties of the interface. Since the ultrasonic reflectivity is primarily influenced by density and elastic properties of the surface, and since these properties for most scale products are significantly different from that of the underlying metal, there is a high probability that the reflection technique may be a sensitive indicator of early scale formation. This program will establish the sensitivity of the reflection technique to various scale deposits on cupro nickel specimens and then explore the practical extension of the technique to environments and geometries representative of saline water conversion systems.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0307, HYDRAULICS OF SURFACE IRRIGATION
C.C. BOWMAN, Montana State University, Agricultural Experiment Sta., Bozeman, Montana 59715

Objectives: To provide fundamental surface irrigation design understanding through the investigation of the hydraulic characteristics of surface flow: 1. By further development of mathematical models describing the flow in terms of the many variables involved, including appropriate testing under controlled conditions. 2. By laboratory experiments for the description and evaluation of component variables. 3. By field trials to test the validity of mathematical equations and laboratory relationships as in (1) and (2) above.

Montana will collect field data required to test the equations developed by Montana, Utah and Washington.

3.0309, MEMBRANES FOR REVERSE OSMOSIS DESALINATION BY DIRECT CASTING ON POROUS SUPPORTS
R.L. NICKERSON, Montana State University, School of Engineering, Bozeman, Montana 59715

Work is being done to develop a reverse osmosis membrane which is as good or better than those currently available and less expensive to produce. This will be accomplished by casting dense cellulose acetate films with a thickness of less than one micron directly on porous supports. Previous work of an exploratory nature has indicated the feasibility of the idea. Research is being done to reduce the film thickness as much as possible and at the same time obtain a flawless membrane with sufficient mechanical strength to allow for necessary handling.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0310, USE OF GROUND WATER IN EXCESS OF RECHARGE
L.K. FISCHER, Univ. of Nebraska, Agricultural Experiment Sta., Lincoln, Nebraska 68508

Objectives: 1. To identify and describe rights in water and the administrative arrangements that regulate water use in several states. 2. To analyze the economic consequences of different systems of water law with particular emphasis on the laws of the states in the North Central Region but including comparisons with legal systems in other regions. 3. To develop principles which will serve as guidelines in efforts to bring about optimum management and use of water resources.

Procedure: The Nebraska Station will engage in a legal-economic analysis of administrative and market procedures used to transfer water rights. The study will include the application of economic efficiency criteria to various procedures used both within and outside the region. Part of the effort will be to develop procedures for using electronic data processing methods in the analysis of water law. A concurrent effort with the Nebraska Law School will analyze the possible effects of alternative institutional arrangements on the use of ground water in Nebraska.

SUPPORTED BY U.S. Dept. of Agriculture
Nebraska State Government

3.0311, LAND SHAPING FOR WATER CONSERVATION
H. WITTMUSS, Univ. of Nebraska, Agricultural Experiment Sta., Lincoln, Nebraska 68508

Objectives: 1. To develop effective engineering practices and construction criteria for the most effective soil and water conservation systems.

2. To evaluate land shaping practices in regard to conservation of moisture as reflected in crop yields and stability of crop production.

3. To evaluate the influence of land shaping practices on runoff losses and to predict the effects of these influences on reduction of flood hazards on small watersheds.

4. To evaluate the effect of land shaping practices on increased ground water recharge or stabilized stream flow conditions on small watersheds.

5. To evaluate the economic feasibility of the different conservation systems.

Work Proposed: New conservation systems will be designed, installed and compared with existing conservation systems. Soil moisture, crop yields and weather data will be collected and analyzed to determine the effectiveness of each conservation system. Straight row farming, conventional terrace systems and parallel terraces with steep back slopes and tile waterways will be studied under the same management system. Engineering specifications and construction criteria will be developed and published for each new type conservation system.

SUPPORTED BY U.S. Dept. of Agriculture
Nebraska State Government

3.0312, ENGINEERING PHASES OF LAND SHAPING FOR SOIL AND WATER CONSERVATION
H.D. WITTMUSS, Univ. of Nebraska, School of Agriculture, Lincoln, Nebraska 68508

Rainfall in Nebraska is characterized by high intensities and short durations. These conditions cause high runoff losses which reduce the water available for crop production and ground water recharge as well as contribute to the destruction caused by flooding. The runoff losses can be eliminated by shaping the land to retain all water. Underground tile systems will be installed to prevent crop damage caused by saturated soils. Practices will also be developed which will increase the intake of water by the soil and extract the water productively from the soil.

Engineering principles needed to properly shape and farm the land will be developed. The different practices will be evaluated in terms of soil moisture storage, water use-efficiency, runoff losses from shaped areas and crop yields.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The project is expected to yield information on the most feasible methods of conserving our water resources on our vast agricultural areas. The water saved will be available for increased crop production and ground water recharge for municipal, agricultural and industrial uses.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
University of Nebraska

3.0313, SPRING IRRIGATION OF ALFALFA

J.A. MCCORMICK, Univ. of Nevada, Agricultural Experiment Sta., Fallon, Nevada 89406

To determine the effects of spring irrigations, by the border method, of deep rooted forage crops when soil at various depths within the root zone exhibits soil temperatures above and below the critical limit for root activity.

Description of Work Proposed: Soil temperatures will be recorded from the surface to the lower root level, at the Newlands Field Station at Fallon Nevada, to establish a representative soil temperature pattern by seasons. The temperature of the irrigation water will be obtained by continuous recorder for the entire growing season. In addition to the temperature of the source water, temperatures will be taken at the upper and lower ends of the borders throughout a twenty-four hour period when irrigation is in progress.

Field trials will be established to study the effects of delaying spring irrigation until soil temperatures have exceeded various levels. Water table recorders will be used to determine the effect of such delay on water table depths.

SUPPORTED BY U.S. Dept. of Agriculture
Nevada State Government

3.0314, IRRIGATION SYSTEMS FOR EFFICIENT WATER USE IN THE GREAT BASIN

P.R. NIXON, U.S. Dept. of Agriculture, Reno, Nevada

Objective. Develop efficient surface and sprinkler irrigation system design and operation criteria and corollary evapotranspiration needs for cool desert areas.

Plan of Work: Continue use of lysimeter complex at University Farm to meter evapotranspiration. Augment instrumentation with data logger system to record energy budget. Investigate water use under 'clothesline' conditions prevalent in Great Basin irrigated valleys. Install and test root zone moisture tension devices. Record sprinkler efficiencies over lysimeters. Devise efficient methods for irrigation of Carson clay soils. Inaugurate tests and methods for automation of irrigation.

SUPPORTED BY U.S. Dept. of Agriculture

3.0315, SALVAGE AND USE OF WATER LOST TO PHREATOPHYTES IN THE GREAT BASIN

W.F. SPENCER, U.S. Dept. of Agriculture, Reno, Nevada

Objective: Measure evapotranspiration of native vegetation and relate to energy budget. Methods of capture and reuse of water or replacement of native species by economic vegetation. Role of soils and climate on forage species and composition.

Plan of Work: Continue evapotranspiration and energy budget measurements using lysimeters. Install replacement vegetation plots and devise methods for propagation using pumped wells. Devise laboratory models to study water-level fluctuations and optimum levels for propagation of forage plants. Survey soil factors which promote growth of greasewood and other non-economic forage plants. Study boron tolerance of tall wheat grass and the effects of cold desert climate on toxic properties of forage produced.

SUPPORTED BY U.S. Dept. of Agriculture

3.0316, IMPROVEMENT AND MANAGEMENT OF THE COMMUNITY PASTURES OF THE PERSHING COUNTY WATER CONSERVATION DISTRICT NEAR BATTLE MOUNTAIN, NEVADA

H.P. CORDS, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

Objectives: (1) Determine the value of different factors in chemical control of phreatophytes, and its application to the question of upstream storage, and peak flow suspension on the Humboldt River. (2) Learn the relationships of water table level and other possible factors to forage yield and composition. (3) Learn the patterns of use most favorable to high sustained production of invaders such as poverty weed.

Description: Several new trials were begun on saltcedar during 1961. Among these were: a trial including five surfactants in combination with silvex at two rates; a new-materials trial including six new formulations of 2,4-D, 2,4,5-T and silvex; and a continuation of the time-of-spraying vs. carbohydrate-level study initiated in 1960. The surfactant trials begun in 1960 resulted in virtually 100% top kill in 1961 regardless of treatment. Consequently, evaluation has been delayed until spring, 1962. Root reserve studies are now virtually complete for both wild rose and saltcedar. They show that food reserves are at their lowest point quite a bit after full leaf stage in the spring for both species.

Two series of grazing treatments have been simulated since 1956 by mowing and clipping. Another study of rotational grazing on four different fields has been under way since 1959. In addition to these three studies, a number of 1 m² permanent quadrats was established on widely scattered locations of the study area.

SUPPORTED BY Nevada State Government

3.0317, PHREATOPHYTE CONTROL - LAHONTAN AND HUMBOLDT BASINS

R.G. HOWARD, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

Studies will be carried out to determine the translocation of systemic herbicides in saltcedar as affected by phenological stages and varying environmental conditions using C14 labeled materials.

Field studies will be made under natural conditions with environmental factors such as soil and air temperatures at and following the time of application. Greenhouse studies will be made with partially controlled environmental factors such as control of soil and air temperatures and root medium osmotic stress, and measurement of osmotic potential of root medium and expressed cell sap under varying environmental conditions.

These studies, in the greenhouse and on government lands near Rye Patch and Lahontan Reservoirs, should provide a better understanding of environmental effects upon the action of systemic herbicides on saltcedar and permit planning of more timely and effective control measures. While similar data have been obtained in other areas, further information is needed for the environmental conditions of the Lahontan and Humboldt Basins.

3.0318, CONSERVATION OF GROUNDWATER THROUGH REPLACEMENT OF PHREATOPHYTES WITH FORAGES

J.H. ROBERTSON, Univ. of Nevada, Agricultural Experiment Sta., Reno, Nevada 89507

To explore the feasibility of using herbicides and fire in combination to clear brush for (a) conservation of ground water, (b) increased forage, (c) easier handling of livestock.

An attempt will be made to relate production of intermediate wheatgrass and pubescent wheatgrass to water table on similar soils. A graded series of piezometers has been installed with this purpose in mind. The first grazing of these 1962 pastures will be in the fall of 1964, thereafter in the spring.

The next two years will be spent in both quantitative and qualitative evaluation of the grass stands already established. Their production will be carefully evaluated in relation to the water table, their water usage will be estimated more closely, the data on hand will be analyzed, including that on evapotranspiration of sagebrush.

The data should be examined by the Department of Agricultural Economics; the State Fish & Game Commission should make an evaluation in terms of wildlife habitat. The Soil Conservation Service should examine the pastures for indicators of soil stability relative to that which prevailed under the big sagebrush canopy prior to 1962.

3.0320, DESIGN AND CONSTRUCTION OF A LOW PRESSURE HOUSEHOLD REVERSE OSMOSIS UNIT
M. TRIBUS, Dartmouth College, School of Engineering, Hanover, New Hampshire 03755

The purpose of this contract is to develop a low pressure household reverse osmosis unit capable of producing 5 to 10 gpd of potable water from brackish water (tap) for potential use by homeowners in brackish water areas. Specific objectives are to design and construct three prototype low pressure, household reverse osmosis units and field test them by installation into homes served with brackish water; to establish the optimum operating conditions of these units under household service conditions; and to prepare a cost estimate for the production of these units in commercial quantities.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0321, DEVELOPMENT OF NEAR NEUTRAL MEMBRANES FOR USE IN TRANSPORT DEPLETION SYSTEM
A.H. HEIT, Ritter Pfaudler Corporation, Birmingham, New Jersey 08011

This is a program in the development of membranes with moderated anion permselectivity. These will be applied in the transport depletion variation of electrodialysis.

Operational advantages, such as greater freedom from inorganic scaling, have been shown with the use of neutral cellulosic membranes in place of membranes of high anion permselectivity in the conventional stack. At the same time, the essential absence of anion selective function imposes a limitation on current efficiency. The cellulosic material is also more susceptible to deterioration due to hydrolytic and oxidative factors.

Our goal is to heighten the cation excluding role of the membrane by compromising concentrations of anion exchanger and base the membrane on non-cellulosic polymers so that current efficiency and long term stability may result. Special fabrication techniques have been devised to provide protection of anion exchange phase from organic fouling.

Data on fundamental properties, membrane potential, area resistance, salt leakage, mechanical strength, hydraulic permeability, etc. is being collected from a variety of compositions. The most suitable membranes shall be evaluated with small and sub-pilot plant sized stacks for performance.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0322, DEVELOPMENT OF PARYLENE COATING FOR DROPWISE CONDENSATION OF WATER ON HEAT EXCHANGERS
W.E. LOEB, Union Carbide Corporation, Bound Brook, New Jersey 08805

A report of work for improved heat transfer with steam via dropwise condensation promoted by parylene. It covers the period from August, 1966 to July, 1967. Background studies on the mechanism of drop nucleation and condensation, together with parylene technology are presented. Lab scale tests with industrial quality steam, plus heat transfer analyses are included. Parylene is Union Carbide's hydrophobic polymer, uniquely vapor vacuum deposited in ultra-thin layers. Increase of some 30% overall heat transfer and coating durability exceeding two

years (test continuing) were obtained with live steam. Coating, for large scale evaluation, of a sizeable heat exchanger from a desalination line at Wrightsville Beach is described together with process and equipment used. One micron of parylene was applied to the exterior (steam side) of the 56-90/10 CuNi tubes (3/4" O.D. 1-ft. diameter steel shell as the vacuum chamber. This experience demonstrates technical feasibility of large scale parylene coating. Treatment and deposition techniques have been developed which provide durable and uniform coatings. Application to long-tube vertical and multistage flash desalination plants is discussed.

3.0323, CONSTRUCTION AND OPERATION OF 7-GPM PILOT PLANT FOR SILICA REMOVAL
D.W. DAVIS, Johns Manville Corporation, Manville, New Jersey (14-01-0001-1710)

This project involves the pilot-scale testing of the activated alumina process developed under Contract 14-01-0001-954 which was reported in R&D Progress Report 286.

The 7-gpm pilot plant consists of a weak acid cation resin softener (sodium cycle) to further soften the effluent from the plant sodium cycle softener and four columns containing activated alumina.

The objective of the tests is to supply water at selected levels of silica and hardness to a pilot-scale evaporator for scale studies.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0324, AN EXPERIMENTAL INVESTIGATION OF CELLULOSE ACETATE MEMBRANE REGENERATION
E.A. HAMER, Amer. Standard Incorporated, New Brunswick, New Jersey

The investigation to be conducted under this contract is to determine the technical feasibility of restoring the desalination properties of cellulose acetate membranes in which the performance and quality rating has declined by using a combination of surface cleaning and membrane regeneration procedures. Membrane performance will be evaluated in an existing array of test cells which accept 2-inch diameter membrane samples and are designed to insure highly turbulent, saline water flow conditions. The two proposed tasks are the membrane surface cleaning and the membrane regeneration.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0325, COMBINED DESALINATION AND POWER-GENERATION BASED ON COAL ENERGY
G.T. SKAPERDAS, M.W. Kellogg Company, New Market, New Jersey 08654

The objective of this work is to combine all available information from the Office of Saline Water, the Geological Survey, the Bureau of Mines, and other sources to determine under what conditions coal can best be used to supply the energy required to produce fresh water from the ocean or underground brackish water resources in the Nation's present and future water-short areas.

The study is divided into two parts. The first will consider the application of well-established technology, such as the combination of multiple-flash distillation systems and standard coal coal-fired power generating plants, to coal supplies and water and power requirements.

The second, looking further into the future, will combine expected oncoming developments such as reverse osmosis desalination, coal-fixed MHD-power generation, and byproduct recovery, in larger complexes which would be most economically viable as the Nation's population increases.

Work on Part One has been completed and will be published in June 1966. Work on Part Two is well advanced. Final report is being prepared - contract still open in hope of doing further work in future.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. of Coal Rch.

3.0326, CONTROLLED FLASH EVAPORATOR, ECONOMIC ANALYSIS AND THE DESIGN OF A DEMONSTRATION PLANT
H. GITTERMAN, Burns & Roe Incorporated, Oradell, New Jersey 07649

A conceptual design of a Controlled Flash Evaporator having a Performance Ratio of approximately 11:1 and a capacity of 2.5 million gallons per day is to be compared with a Multi-Stage Flash Evaporator of similar capacity and performance.

After a review of the economic comparison by the O.S.W., plans and specifications will be prepared to permit the procurement of hardware for the erection of a pilot plant. The pilot plant is to be operated for one year to prove the economic application of the technology of the Controlled Flash Evaporation Process.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0327, ELECTROLYTIC REGENERATION OF ION EXCHANGE RESINS
R. PROBER, Acrochem Research Labs. Inc., Princeton, New Jersey

This study was undertaken to evaluate the technical and economic feasibility of electrically regenerating ion exchange resins used to desalt brackish waters. Information obtained in a state-of-the-art survey will serve as the starting point for laboratory studies which will provide sufficient data for realistic comparison of the cost of electrolytic regeneration with that for conventional chemical regeneration methods.

Two bench-scale test units, each with a product water capacity of 30 gallons/hr, are being built for the laboratory studies. The most favorable combination of commercially available ion exchange resins and arrangement of resin beds (mixed beds or separate anion and cation resin beds) are to be selected on the basis of the power requirements and regeneration efficiencies. Regeneration with constant terminal voltage will be compared with regeneration at constant current density. The effects of feed water temperature, pH and salinity on process efficiency will be determined. Long term tests will be conducted with several promising diaphragm materials.

Tests to be conducted with the most favorable resin combination and arrangement of resin beds will serve to define the optimum current density and the preferred electrolytic regeneration cell design for scaleup to larger units. Tentative design specifications for a 20,000 gpd pilot plant will be prepared.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0328, SIMULATION OF MULTISTAGE FLASH TEST MODULI (9-STAGE SAN DIEGO PLANT)
A.R. GLUECK, Electronic Associates Inc., Princeton, New Jersey

The differential and algebraic equations describing the dynamics of a single flash stage will be reviewed. The computational algorithms will also be re-examined and improved where possible, and the flexibility of the mathematical model for a complete flash train will be augmented.

A steady-state solution for the train will be produced by means of digital computing. Following this, the problem will be programmed for a large-scale hybrid computer, the EAI 8900 System, which will permit dynamic studies.

The data obtained from the hybrid computer runs will be compared with actual plant operating data to demonstrate the suitability of the computing technique to simulating these complex plants. Certain transient conditions will also be simulated, including the following: (1) Start-up, (2) shut-down, (3) loss of steam supply, (4) pump failures.

Two interim reports will be submitted and after completion of the above work, a complete final report will be prepared.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0329, DESIGN, CONSTRUCTION AND OPERATION OF A SKID-MOUNTED ION EXCHANGE PILOT PLANT
R.C. ADAMS, Ritter Pfaudler Corporation, Princeton, New Jersey 08540

To design, construct and operate a skid-mounted ion exchange pilot plant employing Rohm & Haas Company's Desal process. The unit will be field-tested at Roswell, N. M., Yuma, Arizona and Webster, S. D. Cost estimates for large size plants will be made after operating data are obtained. Field testing shall be completed within 16 months.

3.0331, SOLAR HEATING OF WATER TO VERY HIGH TEMPERATURES
M.H. COBBLE, New Mexico State University, School of Engineering, Las Cruces - University Park, New Mexico 88001

Using the mathematical model for the process of radiation from a modified planckian source into a transparent solid having high transmission at short wave-lengths and low transmission at long wavelengths combined with a low thermal conductivity, very high temperatures for the interior of the slab have been predicted and verified experimentally.

It is proposed to extend the analysis to include the case of a transparent slab, irradiated by a modified planckian source, in contact with a well-mixed fluid (insulated) and solve the resulting equations, using complex variable methods and residue theory, for the temperature in the slab and the temperature of the fluid. An experiment will then be set up using the unconcentrated sun as the source, methyl methacrylate as the slab material, and water as the fluid to test the theory. It is certain from previous published work that the water will heat at least to 400°F.

3.0332, CLIMATE AND PHENOLOGICAL PATTERNS FOR AGRICULTURE IN THE WESTERN REGION
M.D. FINKNER, New Mexico State University, Agricultural Experiment Sta., Las Cruces - University Park, New Mexico 88001

1. To determine patterns and variability of climate. 2. To associate phenological response with climatic data.

Sequential relationships of weather events related to precipitation will be described for the Western Region. Experience tables of the lengths of wet and dry spells which have occurred at various stations and at various times will be computed and published rather quickly for immediate use. The theory of Markov processes will be utilized in modeling the precipitation duration aspects of climate. This approach will involve in particular a study of the order of Markov Chains which best fits observed precipitation occurrences on different parts of the region, and the most efficient and reliable method for smoothing the empirical transition probabilities.

Approximately 10 main phenological stations will be established. Montana will develop and provide standardized data forms on which to report the various phenological observations and distribute plants by mail to observers. Geographical progression for different phases of plants in the network will be established. Emphasis will be placed on prediction of later phases of plant response by both early phenological and climatological observations. Relationships between phenological and environmental parameters will be explored with the objective of relating phenological response to meteorological parameters.

3.0333, DISPOSAL OF BRINE BY SOLAR EVAPORATION
C.G. KEYES, New Mexico State University, School of Engineering, *Las Cruces - University Park, New Mexico 88001*

Objective of this work is to determine the evaporation of brine by methods of heat budget and mass transfer. Project will include studies in (1) the effect of solar radiation on brine, (2) albedo of brine and effect of dye on albedo, (3) salinity and saturation vapor pressure, (4) changes in brine temperatures and influences of depth on rates of evaporation and (5) exchange of heat between brine and air.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0334, WATER REQUIREMENTS FOR CROP PRODUCTION IN THE ROSWELL UNDERGROUND WATER BASIN
H.R. STUCKY, New Mexico State University, Water Resources Research Inst., *Las Cruces - University Park, New Mexico 88001*

General Objectives: 1. To assemble and analyze existing cropping patterns, water use, water quality, soil quality and crop yields for the Roswell Underground Water Basin. 2. To determine the water requirements by crops, by farms and the basin under various irrigation methods, efficiencies and cropping patterns. 3. To determine farm and basin income effects from various irrigation methods, efficiencies and cropping patterns.

General Procedures: For Objective 1 - This information will be assembled from existing records and will be used in the analysis of each phase of the work in drawing the overall conclusions for the basin. For Objective 2 - There will be four specific areas from which more detailed information will be collected. a. Southeastern Branch station. 1. The work on general field crops and on three irrigation regimes on cotton (amounts applied and spacing of irrigation) will be continued at the station. 2. Two additional irrigation regimes will be added for cotton. 3. A new irrigation trial with several irrigation regimes for alfalfa will be instituted. measurements and soil moisture data will be secured on each of the trials above. b. One to three additional farms near the Branch Station, especially selected for observations similar to those on the Station under farm conditions but in somewhat less detail than the Station work. c. Up to seven to nine additional farms, selected for geographic location, irrigation practices, soil type, water quality and for some detailed records on the amounts of water pumped at various specified periods. d. The five farms, on which meters have been installed since 1956, would be used for developing historical crop, fertilizer, weather and other records for analysis in comparison to the annual pumping records which are available. For Objective 3 - The information assembled under Objective 1 and 2 will be used as part of the income and cost analysis. Additional information will be secured by an agricultural engineer making random observations and measurements on irrigation practices and water applications on up to ten selected farms and the five metered farms, and on other farms where desirable conditions of cooperation and other factors are found.

3.0337, THE EFFECT OF IRRIGATION METHOD, AND MOISTURE AND FERTILITY LEVELS UPON MAXIMIZING WATER USE EFFICIENCY AND QUALITY COTTON FIBER PRODUCTION

B.C. WILLIAMS, New Mexico State University, School of Agriculture, *Las Cruces - University Park, New Mexico 88001*

Agricultural water-use efficiency is affected by many factors which include methods and levels of water and level of soil fertility.

The work proposed here is a field experiment using sub-irrigation and surface irrigation at two levels of application interacted with six levels of fertility: 1. To measure the water-use efficiency of acala cotton under different regimes of soil moisture and fertilizer levels. 2. To measure the amount of water which may be saved by minimizing evaporation with sub-irrigation as compared to surface irrigation practices. 3. To determine the influence of moisture level and fertility level on yield and quality of acala cotton. 4. To determine the influence of irrigation and fertilizer practices upon production of quality cotton fiber. 5. To determine a suitable design of a sub-irrigation system and recommended depths of placement for selected soils in New Mexico. 6. To determine operation and maintenance procedures to prevent clogging of sub-irrigation systems.

The sub-irrigation will be done with perforated plastic pipes buried under the crop rows and surface irrigation will be done by furrow system.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Rch
New Mexico State University

3.0338, EFFECT OF RANGE AND WATER ON MULE DEER POPULATION

J.E. WOOD, New Mexico State University, Agricultural Experiment Sta., *Las Cruces - University Park, New Mexico 88001*

Objectives: 1. To determine the distribution and density of deer in the various ecological habitats and record annual changes in population. 2. Determine for a known density of deer, the amount of summer and winter deer use of key browse species at various distances from water and on the various slopes and exposures. 3. Determine the effects of placing catchment game watering units in dry habitats on the distribution and abundance of deer and on the utilization of the range.

Description of work proposed: Deer abundance, distribution and use on the varying slopes and exposures and distances from water will be evaluated by sampling their density in the various areas by pellet transects, drives, reconnaissance, and permanent census routes. Utilization of browse in these areas will be determined by percentage of plants browsed and by a weight twig use method. The effects on deer numbers and distribution resulting from the installation of water catchment units placed two miles or more from permanent water will be determined by recording

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

changes in numbers at annual censuses and changes in browse utilization.

SUPPORTED BY U.S. Dept. of Agriculture
New Mexico State Government

3.0339, ICE FORMATION BY CONTACT NUCLEATION N.R. GOKHALE, State University of New York, Graduate School, Albany, New York 12203

This grant provides support for the third year of research begun under GA-328. The purpose of the research is to perform laboratory studies to determine whether dry nucleants in the atmosphere can produce freezing in supercooled water droplets upon contact at a warmer temperature than would be produced by the same nucleants which are already embedded in the droplet before supercooling takes place. It is believed that such an effort may be responsible for the observations of several research groups that large frozen droplets or graupel are usually found in the outer periphery of clouds and seldom in the central core.

Using a constant rate of cooling apparatus developed under a previous grant, the principal investigator will obtain median freezing temperatures of water drops by contact nucleation and determine how freezing depends on the volume of the drop, initial temperature of the drop, concentration and size of nucleating particles introduced in the vicinity of the drop, and the composition and crystallographic nature of the nucleating materials used. In addition, microphotography will be used to determine how the dry nucleating particle interacts with the droplet surface upon contact.

SUPPORTED BY U.S. National Science Foundation

3.0340, SYNTHESIS OF MODIFIED LOEB MEMBRANES BY GRAFTING C. HOROWITZ, Polymer Res. Corp. of Amer., Brooklyn, New York

Using a chemical grafting method developed by Polymer Research Corp. of America, various monomers will be attached by grafting to cellulose acetate Loeb membranes in order to increase their hydrophilic character, to increase the water transfer across the membrane, to increase their compactness, their desalting efficiency and salt rejection characteristics. The monomers to be grafted will cover a wide spectrum of polar and nonpolar molecules and they will be chemically attached by etherifying the free hydroxyl group of cellulose acetate. Grafting will be performed on cellulose acetate resin solution, before preparing the membranes and on prepared membranes. The membranes will be prepared both by casting and by continuous impregnation of a fabric. The membranes will be immersed in a precipitating water bath. The dense and porous effect will be produced by floating the impregnated fabric on water. Attempts will be made to control the depth of grafting in the membrane. The parameters of monomer and catalyst concentration and temperature will be evaluated. Long and short chain grafts will be produced.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0341, INORGANIC ION EXCHANGERS AND THE NUCLEATION OF SCALE FORMING MATERIALS G.H. NANCOLLAS, State University of New York, Graduate School, Buffalo, New York 14214

(1) The kinetics of crystallization from solution of important scale-forming substances such as calcium sulfate, calcium carbonate and magnesium hydroxide will be investigated. Rates of crystallization will be followed, (a) conductimetrically, (b) potentiometrically, (c) analytically, and (d) by direct microscopic observation of the growing crystals. The crystallization processes will be characterized kinetically and the inhibiting effects of added substances will be quantitatively studied. The corresponding dissolution kinetics into subsaturated solutions will also be studied.

(2) Kinetic studies are to be made of the exchange of bivalent metal ions on zirconium phosphate. Ion-sieve behavior will be investigated using cations of different sizes both in equilibrium and kinetic experiments. The relationships between

ion exchange capacity, structure of zirconium phosphates, pH, size and concentration of ingoing ions will continue to be actively investigated since these are all factors of direct influence upon the commercial use of this exchanger.

(3) Calorimetric investigations of the heats of cation exchange on polyvalent anion salts and of anion and cation exchange on the hydrated oxides will be continued. Both monovalent (e.g. alkali metal) and divalent (alkaline earth) cations will be studied, and the thermodynamic functions will be interpreted as described previously.

3.0345, CONCEPTUAL DESIGN STUDY - REVERSE OSMOSIS MEMBRANE ASSEMBLY MODULAR UNIT S.B. TUWINER, R A I Research Corporation, Long Island City, New York 11101

This work results from Office of Saline Water's invitation for proposals on new design concepts in reverse osmosis. The purpose of this study is to design a reverse osmosis module in which the individual elements, consisting of a pair of membranes and intervening separator, are suspended in a closely spaced, parallel array. The design is characterized by an absence of spacers between the flexible elements except for the minimum number which is required to stabilize the positions of the elements and the

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

flow channels. Advantages of this construction are a minimum use of material and the virtually unimpeded flow of solution parallel with, and between the membranes. Such a design leads to a compact array of membranes and results in the combination of moderate flow velocity and high water recovery ratio per stage which is conducive to a high capacity at minimum cost.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0346, APPLICATION OF THE HIGH TEMPERATURE WATER JET COMPRESSOR TO THREE MAJOR DESALINATION PROCESSES

B.S. BREITMAN, Amer. Hydrotherm Corporation, New York, New York 10016

A high temperature Water thermocompressor test installation is considered for three Office of Saline Water desalination plants, Roswell, Freeport, and Claire Engle. The test installation would reduce present water costs by 14 cents, 2.4 cents and 1.4 cents/1000 gal. respectively. The required process and equipment changes and capital cost for each process are shown. In each process the HTW jet compression cycle produces 4 to 5 pounds of product/1000 Btu heat input and rejects the heat as steam (200 degrees F to 300 degrees F) to a ME or MSF process producing an additional 5 to 20 pounds of product/100 Btu. A special process design is described for Roswell to enable operation on the slurry recycle system at a 30% capacity without the existing mechanical compressor. Fuel cost will be 36.5 cents/1000 gallons and installation cost will be \$165,000 for this special installation.

3.0347, ENGINEERING ECONOMICS OF WATER DESALTING IN COMBINATION WITH NITROGEN FIXATION FOR AGRICULTURAL CHEMICALS MANUFACTURE

S.A. BRESLER, Chemical Engineering Assoc., New York, New York 10025 (14-01-0001-1483)

This study provides a preliminary economic evaluation of the cost of co-producing ammonia and desalted water from fossil and nuclear energy supplied from common energy centers. Four cases of fossil heat supply are under study for ammonia production rates ranging from 500 to 2000 tons per day, utilizing the waste heat for water desalting; two cases of ammonia and water production, in thermodynamically balanced systems which provide desalted water in a water-ammonia ratio nearer that required for irrigation applications, are being studied. A seventh case explores the preliminary economics of utilizing a high temperature gas cooled nuclear reactor for in-situ reforming of natural gas for ammonia manufacture and steam generation for power and desalted water production.

3.0348, ACTIVE AND PASSIVE ION FLUXES ACROSS INTERFACES AND MEMBRANES

M. BLANK, Columbia University, School of Medicine, New York, New York 10027

The long term goal of these investigations is to gain an understanding of the mechanisms of membrane processes, specifically those having to do with ion transport. While earlier investigations dealt exclusively with the passive aspects of transport our recent work has enabled us to approach the far more complicated problem of active transport, an area that is much more interesting to the membrane physiologist and certainly more characteristic of the living state. The immediate aims of this project can be summarized as follows: 1. To study the active ion transport system of cells by several different approaches which include: a) study of the enzyme associated with the ion pump b) study of the binding of ions to the enzyme and to cell membranes in vivo c) study of the transport properties of the enzyme at interfaces. 2. To continue our theoretical approach to the problem of the ionic fluxes in excitable membranes utilizing our recent findings with regard to passive transport processes.

3.0349, A NUCLEAR MAGNETIC RELAXATION INVESTIGATION OF WATER-MEMBRANE INTERACTIONS

J.A. GLASEL, Columbia University, School of Medicine, New York, New York 10027 (14-01-0001-1700)

The purpose of this research is to investigate the structure of water and aqueous solutions in the immediate vicinity of water-membrane interfaces by the methods of nuclear magnetic relaxation. In particular, the methods used will be those developed in this laboratory and elsewhere to study water structure by the relaxation of the isotopes O-17 and H-2 in water enriched with them. The ultimate objective will be to determine the significance of structuring of water in pores and on the surface of membranes in the phenomenon of diffusion. In addition, information will be gathered on the effect of membrane structure, extensive thermodynamic variables and ionic composition on the structure of water in these environments. Special experimental apparatus, involving the interfacing of a digital computer to various types of N.M.R. apparatus, is being built as part of this project.

3.0351, STUDIES OF MEMBRANE PHENOMENA - PREPARATION OF NEW ELECTRODIALYSIS MEMBRANES

H.P. GREGOR, Columbia University, School of Engineering, New York, New York 10027

This study calls for the preparation of W-dialkylamino-L-olefins, their copolymerization and their incorporation into ion-exchange membranes; theoretical and experimental studies of polarization phenomena with these membranes; parallel studies with membranes employing the vinylsulfonic monomer.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0352, ENGINEERING FEASIBILITY STUDY OF THE HORIZONTAL TUBE MULTIPLE EFFECT DISTILLATION PROCESS

R.B. COX, Univ. Desalting Corporation, New York, New York 10017 (14-01-001-1707)

An engineering feasibility study of a new Horizontal Tube Multi-Effect (HTME) Desalination Plant will be performed. The HTME design shows promise of large reductions in capital cost compared with either LTV or MSF plants. In the new design, in each effect the evaporator tubes are horizontal with the vapor condensing in the inside and the brine boiling on the outside to provide very high heat transfer coefficients. These effects are then stacked vertically to form a compact structure with a minimum of pumps, valves, piping and controls, to provide large savings in both capital costs and power consumption. UDC will design, fabricate and install experimental equipment at the OSW Wrightsville Beach Test Facility and conduct an experimental program in order to: 1. obtain and confirm the factors that are pertinent to the design of an HTME Desalination Plant, and 2. determine the mechanism that is responsible for the high heat transfer rate in an HTME evaporation process. UDC will also make conceptual design studies to determine the capital and operating costs of 2.5 MGD-HTME plants.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0353, THE STRUCTURE OF THE ACTIVE LAYER OF THE ASSYMETRIC CELLULOSE ACETATE MEMBRANE - THE SALT AND WATER PERMEABILITY OF A BIOLOGICAL MEMBRANE

R.M. HAYS, Yeshiva University, School of Medicine, New York, New York 10033

It is proposed to determine the rates of water flow and water diffusion across the asymmetric cellulose acetate membrane (desalination membrane), under a variety of experimental conditions. From these data, and from experimentally determined reflection coefficients of small solutes, the porosity of the 'skin' layer of the asymmetric membrane will be estimated.

A second line of investigation concerns the mechanism by which high water flows can take place across biological membranes. The isolated urinary bladder of the toad will be used in these studies. This is a tissue which is sensitive to the hormone vasopressin, and can increase water movement after hormone to a point that exceeds that of the asymmetric cellulose acetate membrane.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0354, STUDIES OF NATURALLY OCCURRING ACIDIC LIPIDS - IONIC, SURFACE AND MEMBRANE PROPERTIES

R. KATZMAN, Yeshiva University, School of Medicine, New York, New York 10033

The proposed research will continue the investigations of the micellar and membrane properties of lipids.

Aqueous micellar systems of mixed lipids will be formed by means of ultrasonic radiation. 'Zwitterion' lipids, lecithin, phosphatidylethanolamine or sphingomyelin will be incorporated with acidic lipids in mixed systems. Titration studies will indicate interaction of the different charged groups. The reactions of these micelles with cations will be studied by turbidimetric titrations and by chemical analysis of coagula. The cation selectivities will be determined for varying compositions of lipids. Light scattering studies will be made to measure the micellar sizes of these systems which will be related to their electron micrographs.

The mechanism of water transport through reconstituted lipid membranes will be investigated. Measurements of the temperature coefficient will give the 'activation energy'. Changing the lipid composition of the membrane and the addition of detergents or proteins will permit a study of the chemical nature of the membrane and its permeability.

3.0355, SEASONAL VARIATIONS OF SOME LIMNOLOGICAL FACTORS IN LITTLE SODUS BAY, NEW YORK

R. ENGEL, State University of New York, Graduate School, Oswego, New York 13126

The southern shoreline of Lake Ontario is interrupted by numerous small to large size bays. The openings of these bays into Lake Ontario are regulated by wave action of the lake or by dredging operations and breakwaters. Little Sodus Bay is located in the northwest corner of Cayuga County and covers approximately 630 acres. With the Town of Fair Haven at its southern end, the bay provides a recreational facility and protected area for small boats and fisherman. Little is known about the biological productivity of this and similar bays on Lake Ontario, about physical and chemical factors that determine the productivity, or about the possible effect of the productivity of these shallow bays on Lake Ontario as an aquatic environment.

Thus it is proposed to study the protected waters of Little Sodus Bay to determine the seasonal variations of biological productivity and an analysis of the causative factors. The data will provide an illustration of a special eutrophic situation and the possible influence of pollution from the surrounding area. The collected information will also be useful when studies on the adjacent open lake are undertaken. Because we lack a suitable research vessel at the present time, limnological investigations initiated by the field biology station must be carried out in protected waters.

Samples (from different locations and depths will be analyzed for dissolved oxygen, carbon dioxide, hardness, alkalinity, pH, phosphates, nitrates, and total dissolved solids) will be taken once every two weeks during the open water season and monthly when there is an ice cover. Physical factors of light transmittance, temperature (air and water), wind, current and turbidity will be observed.

SUPPORTED BY State University of New York

3.0356, A STUDY OF THE NUCLEATION AND GROWTH CHARACTERISTICS OF SLURRIES OF ICE CRYSTALS

J. ESTRIN, Clarkson College of Technology, School of Engineering, Potsdam, New York 13676

This proposed work involves an experimental and theoretical program whose goal it is to improve our understanding of secondary nucleation phenomena and the subsequent growth process associated with slurries of crystals. The experiments are to be carried out with the salt-ice-water system in a) super-saturated solutions dilute in suspended ice crystals and in b) concentrated slurries in well-defined fluid mechanical shear fields.

The primary independent variables are to be supersaturation, slurry concentration, fluid mechanical shear, concentration of salt; the dependent variables are to be size distribution of product crystals, number of crystals, nucleation rate, qualitative nature of crystals and steady state, batch and transient-response type runs are to be carried out. Quantitative descriptions of the nucleation and growth phenomena are to be determined so that this information coupled with the 'Kinematic' description of particle growth processes (i.e., particle balance equations) well described in current literature, will permit the prediction of the nature of operation of full-size production equipment.

3.0360, DESALINATION BY HIGH PRESSURE SOLIDIFICATION OF WATER TO ICE

D.H. JELLINEK, Clarkson College of Technology, Graduate School, Potsdam, New York 13676 (14-01-0001-1789)

It is proposed to transform partially saline water under high pressure to ice VI at about 25°C. The mother liquor will be removed and the desalinated water will be recovered from ice VI. A suitable apparatus will be constructed for this purpose.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0361, DIFFUSION PHENOMENA IN ICE - RECRYSTALLIZATION PHENOMENA IN ICE

H.H. JELLINEK, Clarkson College of Technology, Graduate School, Potsdam, New York 13676

I. Diffusion in, on and into ice of electrolytes will be studied as a function of concentration, temperature and crystallinity. There are no data available on substances relevant to sea water. Due to the large surface/mass ratio of the ice produced in desalination freezing processes, diffusion phenomena will be of practical importance in obtaining well defined ice products of suitable crystallite size.

II. Crystal growth (rate and habit) of ice will be studied as a function of small concentrations of electrolytes and especially organic substances as a function of temperature, pressure and concentration. Extremely small quantities of 'impurities' can be quite effective if they are adsorbed on growing crystal faces and hence have an important practical bearing on the type of ice obtained during freezing desalination processes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0362, CHARACTERIZATION OF CELLULOSE ACETATE MEMBRANES AND ULTRATHIN FILMS FOR REVERSE OSMOSIS

C.P. BEAN, General Electric Company, Schenectady, New York

The objectives of this project are: a) to develop techniques for measurement of electrical impedance as a function of frequency and electrokinetic effects of cellulose acetate membranes used for reverse osmosis, b) to develop the theory for interpreting these results in terms of the physical and chemical structures of these membranes, c) to apply these techniques and theories to the characterization of both conventional and ultrathin membranes. An aim of this work is to provide information on the modes of salt and water transport and so provide theoretical guidelines for the subsequent development of new and/or improved reverse osmosis membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0363, RESEARCH ON NEW ION-ADSORPTION ELECTRODES FOR DEMINERALIZATION OF SALINE WATER

T.O. ROUSE, General Electric Company, Schenectady, New York (14-01-0001-612)

A cation adsorption electrode is comprised of a conducting matrix, and an insoluble material capable of being electrochemically reduced and oxidized in the presence of saline water. In the reduced state, the insoluble material is capable of adsorbing cations from solution; in the oxidized state, of desorbing the cations into solution. An anion adsorption electrode is similar, adsorbing anions in the oxidized state and rejecting them in the reduced state. Together, the two electrodes form a cell capable of electrochemically desalinating flowing water for use. Regeneration of the electrodes is also accomplished electrochemically, rejecting the absorbed salts into a waste stream.

During the first two years of this program, several promising ion adsorption electrode materials were found. In general, these are polymeric materials with grafted functional groups to provide redox behavior. The program is now directed toward a detailed understanding redox mechanisms to be followed by electrode optimization studies, and finally by single cell desalination tests to evaluate operating parameters, power consumption, capacity, life, etc.

A second facet of the program will be a search for materials capable of preferentially adsorbing divalent cations.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0364, PREPARATION AND CHARACTERIZATION OF MEMBRANES FOR REVERSE OSMOSIS

P. LUNER, State University of New York, Graduate School, Syracuse, New York 13210

While cellulose acetate membranes for reverse osmosis compare favorably with other polymer membranes from the point of view of flux and salt rejection, they possess definite deficiencies. The most important of these are a decrease in permeability and a deterioration of the rejection ability during continued use. One objective of this research is, therefore: I. To prepare cellulose acetate membranes for reverse osmosis with improved mechanical properties (especially in the wet state) and stability. Achievement of this objective would considerably increase the feasibility of large-scale desalination.

The fact that cellulose acetate membranes show favorable transport properties and salt rejection raises the possibility of utilizing other polysaccharides as a starting material to prepare membranes for reverse osmosis. Another objective of this research program is, therefore: II. To prepare membranes from polysaccharide derivatives and evaluate them for desalination ability. While the specific objective is to find better membranes, the results of this work could give new information on the relationship between chemical structure and desalination ability.

To elucidate the mechanism of salt rejection and water diffusion in cellulose acetate membranes a number of approaches have been employed. These include water sorption studies (1), diffusion studies (2), and salt transport phenomena (3). To add further knowledge to this important area, a further objective of this program is: III. To study the behavior of monolayers of cellulose derivatives on water and salt substrates.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0365, STUDIES ON THE FREEZING PROCESS FOR DESALTING SALINE WATERS

A.J. BARDUHN, Syracuse University, School of Engineering, Syracuse, New York 13210

The work to be undertaken is divided into three parts. 1. The occurrence and thermodynamic properties of the hydrates of normal and iso-butane are to be investigated because of the use of these hydrocarbons as direct contact refrigerants in several of the freezing processes. Normal butane has been thought not to form a hydrate but it has apparently given trouble in at least one process. Iso-butane hydrate is known to exist but it has not been reported to form in those freezing processes where a mixture of the butanes is used as the refrigerant.

2. It is postulated that the ice beds formed in a wash column must be strongly anisotropic and have a much higher permeability in the lateral direction than in the vertical direction in which they were formed. This should be studied since it should affect favorably the cost of wash columns when properly designed.

3. Studies on washing in porous media are to be continued and aimed more in the direction of design.

3.0367, REVERSE OSMOSIS PERMEATORS - DESIGN STUDY

H.W. MCROBBIE, Union Carbide Corporation, Tarrytown, New York

The objective of this contract is to determine the technical feasibility of modifying the commercial gaseous and liquid permeators for reverse osmosis desalination application. Design and membrane support materials suitable for construction of reverse osmosis modules of spiral and rectangular configuration will be developed if the design or materials of construction of these permeators are found to be inadequate for reverse osmosis application. A 1000 gpd pilot plant will be designed, constructed and test operated on synthetic brackish waters. Preliminary cost estimates will be prepared.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0368, LIFE TEST OF NOVEL EVAPORATOR

A.M. CZIKK, Union Carbide Corporation, Tonawanda, New York

A novel plate-fin evaporator, employing mechanically activated boiling surfaces was previously tested in sea water in falling film mode. An overall heat transfer coefficient of 3000 BTU/(Hr.) (square foot) (degree F) was obtained in 1967, in short-term tests.

The pilot plant at Wrightsville Beach, North Carolina has now been modified for a 2000 hr. life test. A series of test runs, each of 200-300 hours, in deaerated, decarbonated sea water at 1 atm. are planned. The life test began on June 20, 1968. The overall coefficient was found to be still equal to the 3000 BTU/(Hr.) (square foot) (degree F) obtained in the earlier tests. After 450 hours of operation, no change in overall coefficient has occurred.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0369, METALLIC CORROSION IN HALIDE ENVIRONMENTS

N.D. GREENE, Rensselaer Polytechnic Inst., School of Engineering, Troy, New York 12181

The general aim of this research program is to understand and control metallic corrosion in halide environments using electrochemical measurements. Particular emphasis placed in corrosion phenomena associated with saline water conversion.

This investigation consists of three major topics: 1. Cathodic Protection. Theoretical and experimental studies to determine criteria for cathodically protecting metal structures exposed to halide media. 2. Alloy Studies. An investigation to develop new corrosion-resistant alloys using electrode kinetic measurements. Specific attention is being devoted to improving resistance to stress-corrosion cracking and pitting corrosion. 3. Exploratory Studies. Basic research on other topics related to corrosion in halide media including: anodic protection and passivity in chloride media and the specific effects of halides (F-, Cl-, Br-, I-) on electrochemical and corrosion reactions.

3.0370, THE CONTROL OF SCALING ON HEAT TRANSFER SURFACES BY DIRECT CONTACT WITH A FLUIDIZED BED OF GRANULAR MATERIAL

L.P. HATCH, Brookhaven Natl. Lab., Upton, New York

The investigation is being continued and expanded to further evaluate the feasibility of using fluidized bed units in high temperature distillation of sea water. The program for 1968 includes the following items: 1. Continue and expand present studies on the performance characteristics of fluidized bed heat exchanger systems at about 350 degrees F with and without inline filters and under different patterns of flow, i.e., with different average residence times and recirculation rates. 2. Investigate methods of

preventing or minimizing deposition of calcium sulfate downstream of the fluidized bed heat exchanger as a result of calcium sulfate super-saturation of the solution upon heating to temperatures in the range of 350-400 degrees F. 3. Continue and expand the studies at 400 degrees F to determine basic operational characteristics at this high temperature level with particular emphasis on a) improvement in over-all heat transfer values, b) reduction of calcium ion concentration, c) minimizing the formation of calcium sulfate deposits downstream of the fluidized bed exchanger, possible as a result of more immediate formation of anhydrite crystals at the high temperature with reduced tendency to produce adherent and cohesive solid masses, and d) reducing the problems of continuous operation of filters for removing the precipitated calcium sulfate because of the non-cohesive nature of the solids remaining in the filter chamber. 4. Determine the upper limits of temperature for scale-free operation in a conventional heat exchanger after a) reducing the calcium and sulfate levels by means of heating to high temperature in a fluidized bed unit followed by high temperature filtering, and b) concentrating the total salts by simple evaporation. 5. Study the effect of seeding the solution with anhydrite calcium sulfate crystals on subsequent deposition of calcium sulfate downstream of the fluidized bed heat exchanger operating at temperatures of 350 degrees F or higher.

3.0371, STUDY OF FACTORS WHICH DETERMINE THE IONIC SELECTIVITY OF BIOLOGICAL AND ARTIFICIAL MEMBRANES

D.C. TOSTESON, Duke University, School of Medicine, Durham, North Carolina 27706

We propose to establish the relation between the chemical composition and structure of depsipeptides and their capacity to produce selective permeability of biological and artificial membranes. Various cyclic depsipeptides will be synthesized by the solid state method in the laboratory of R. B. Merrifield at Rockefeller University. The ionic selectivity which these compounds produce in membranes will be evaluated in the laboratory of D. C. Tosteson at Duke University. The effect of the compounds on K and Na permeability of HK and LK sheep red cells as well as on thin membranes formed from lipids extracted from these cells will be measured. The effect of the compounds on the activities of K and Na in aqueous solution will also be evaluated.

3.0372, FLOOD RUNOFF & WATER YIELD FROM GLACIATED MOUNTAINS

R.S. PIERCE, U.S. Dept. of Agriculture, N.E. Forest & Rge. Expt. Sta., Durham, North Carolina 03824

Object: To learn the characteristics of streamflow from forest lands and to find ways to limit streamflow extremes through manipulation of forest cover on glaciated mountainous terrain in New England.

Plan of work: The project staff is conducting work on two levels: plot studies and gaged experimental watershed studies. On the plots they are determining relationships between climatic factors, forest types, and soils. On the experimental watersheds they are testing hypotheses and vegetative treatments on streamflow. They are conducting detailed energy balance studies of solar radiation and sensible heat in terms of snowmelt and estimating evapotranspiration for water balance tabulations.

SUPPORTED BY U.S. Dept. of Agriculture

3.0373, MOSAIC MEMBRANES FOR DESALINATION

H. YASUDA, Res. Triangle Institute, Durham - Research Triangle Pk., North Carolina 27709

Improved membranes processing a mosaic structure are proposed for use in reverse osmosis, electrodialysis, and piezodialysis. Such membranes, which have not been used heretofore in membrane technology, will be produced from ABA-type block copolymers in which the incompatibility of the A and B polymer blocks results in partial phase separation. By proper chemical modifications the necessary ionic domains will be formed.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0374, QUANTITY, QUALITY, AND TIMING OF WATER YIELDS IN THE SOUTHERN APPALACHIANS-PIEDMONT
J.E. DOUGLAS, U.S. Dept. of Agriculture, *Franklin, North Carolina*

Object: To develop principles, prediction methods, and techniques for managing watershed lands for improved water yield and other purposes.

Plan of Work: The Coweeta Hydrologic Laboratory has more than 20 calibrated experimental forested watersheds for empirical studies and for testing hypotheses. An increasing proportion of recent activity is on basic research. The program is organized under four interdisciplinary fields to develop understanding of climatic, biologic, and hydrologic processes and to derive relationships between these processes. The four fields are (1) hydro meteorology, in which the staff is studying precipitation variation, the radiant energy budget, and evapotranspiration; (2) plant-water relations including interception effects; (3) soil-water relations, including unsaturated flow studies; and (4) streamflow.

3.0376, SURVEY OF WATER UTILIZATION AND WASTE CONTROL IN THE PULP AND PAPER INDUSTRY

C.N. ROGERS, Univ. of North Carolina, Graduate School, *Raleigh, North Carolina 27600*

Rapid growth of the pulp and paper industry in the South, which now produces 60% of the Nation's pulp, accents that their effluent problem is becoming increasingly important. The problem involves not only the waste of valuable products, but the danger of pollution to the neighboring water bodies in either surface, sub-surface, or both.

The objective of this proposed research project is to conduct a broadly based, industry wide evaluation of methods of effluent improvement for various types of paper mills in the South. From such an evaluation, specific problem areas will be identified for subsequent research in depth, and baselines established for future guidance of the industry and priority of alternate approaches to solving the problems of effluent controls. Emphasis will be placed upon identifying in-plant processing opportunities from technical and economic aspects to reduce the effluent at its source.

These studies will include systems covering: A. Specific manufacturing processes producing effluent. B. In-plant systems reducing losses and quantity of effluent. C. Methods and costs of effluent improvement subsequent to the plant.

Important factors to be studied are characteristics and amounts of effluent; methods of water conservation, waste control and treatment; effectiveness; costs; and problems yet to be solved.

3.0378, PREPARATION AND PROPERTIES OF GRAFTED AND VECTORED MEMBRANES FOR USE IN DESALINATION

V.T. STANNETT, Univ. of North Carolina, School of Engineering, *Raleigh, North Carolina 27600*

The research will be concerned with two principal areas of membrane development. (1) the improvement of cellulose acetate as a membrane base. (2) The preparation and properties of novel membranes for reverse osmosis desalination.

The main emphasis in both phases of the research will be on the use of graft copolymerization techniques.

Specific areas to be studied include: 1. Investigate improvement of compaction resistance of the asymmetric cellulose (2.5) acetate 'tight' membrane (for desalination of sea water) via graft copolymerization of styrene monomer and/or alpha-methyl styrene-styrene monomer blends. a. The effect of grafting to the porous side of asymmetric cellulose acetate reverse osmosis membranes on their desalination and time dependent desalination properties will be studied. b. Preparation of styrene and alpha-methyl styrene on grafted cellulose acetate resin and subsequent asymmetric membrane fabrication from these novel resins will be attempted if 1.a. does not produce acceptable results. c. Early work will include grafting to VFHP CA/CN (100 Angstrom units) 'homogeneous' millipore filters. 2. The grafting of small hydrophilic gels or films across pores of various relatively non-deformable porous structures shall be investigated as an approach to develop desalination characteristics into the latter systems. 3. 'Vectoring' of selected porous hydrophilic/hydrophobic graft copolymer membranes shall be investigated as an approach to the formation of desalination surface films or layers, i.e., formation of appropriate asymmetric desalination membranes. 4. Candidate reverse osmosis membranes will be evaluated in reverse osmosis cells which effectively eliminate boundary layer concentration polarization.

3.0380, THE EXTENT OF IRRIGATION DEVELOPMENT IN NORTH DAKOTA AND ITS ECONOMIC IMPACT

D.O. ANDERSON, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Objectives: 1. To develop methodology for determining the most profitable water resource development for irrigation. 2. To estimate future water use and development and levels of aggregate supply of presently produced and potentially feasible agricultural products. 3. To determine the market potential and price to producers of agricultural commodities produced. 4. To estimate the economic impact of alternative levels of agricultural water development on income and employment.

Description of Work Proposed: This study will develop a linear programming model of the entire state to determine the profit maximizing level of water development for irrigation. Market information will be generated in order to define demand conditions and market alternatives for products which can be produced in the state under irrigation. This study will utilize input-output analysis to determine the secondary impact of irrigation development on the North Dakota economy.

SUPPORTED BY North Dakota State Government

3.0381, EVALUATION OF EXTENSIVE IRRIGATION

H. HOLMEN, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

1. To determine the operational characteristics of some mechanized sprinkler systems and to evaluate some irrigation efficiencies with extensive irrigation.

The project will be conducted jointly by the Agr. Engr. Dept., and the Carrington Irrigation Branch Station at Carrington, North Dakota. The first system to be studied will be one where the sprinkler line rotates in a circle about one end as a pivot. The system will be used on four fields adjacent to each other. Problems associated with transporting the system from field to field between irrigations will be studied. The uniformity of application and the distribution efficiency will be measured. A system of containers spaced 10 ft. radially from the pivot will be used to evaluate the distribution pattern. Climatic factors including wind, evaporation and air temperature will be recorded. Some runoff measurements will be made early in the experiment; and if runoff becomes a problem, a more extensive study will be developed.

A cropping system will be used where extensive irrigation will promote efficiency in use of the irrigation system. A low plant water stress will be maintained at the critical stage of plant development for each crop, and a minimum amount of water will be applied at other stages of plant growth depending upon the capacity of the sprinkler system. The yield and water use efficiency will determine if extensive irrigation is a practical means of using mechanical irrigation systems.

3.0382, INFLUENCE OF WATER QUALITY IN MAINTAINING WHITENESS WHEN LAUNDERING WHITE FABRICS

C.M. JANECEK, North Dakota State University, Graduate School, Fargo, North Dakota 58102

Objectives: (1) To identify the factors that influence the discoloration of white fabrics when laundered in hard water and/or waters containing iron, manganese or organic coloring. (2) To determine methods that prevent discoloration of white fabrics during laundering. (3) To determine whether any of the methods used to retain whiteness cause a decrease in residual strength or cause other undesirable effects.

It is planned to work with State Extension personnel in enlisting cooperating homemakers. Swatches of white test fabric will be

given to each cooperator to be laundered a specified number of times. The swatches will be returned to the laboratory for determination of the degree of discoloration. Information on water supply, iron removal and softening equipment, washing agents and methods will be obtained from each cooperator.

After the factors causing discoloration have been identified, various methods for preventing discoloration will be evaluated. These methods include removal of iron, water softening and the use of selected types of bleach and detergent. Laboratory analyses of the swatches will determine whether or not methods used to attain whiteness are detrimental to the fabric.

3.0383, IRRIGATION WATER USE EVALUATION

E.C. STEGMAN, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

1. To evaluate the water delivery requirements for a farm size unit subjected to a management level attainable by farm operators. 2. To determine the operational performance of graded borders and furrows which may be used to develop guides or design criteria for use in the Garrison Diversion area. 3. To develop functional criteria for planning and design of irrigation systems.

Work Proposed: Measurements will be made to determine inflow and outflow associated with irrigation in field size areas. Ground water levels will be observed. Runoff hydrographs associated with precipitation will be obtained. Soil moisture will be determined. Irrigation and drainage requirements will be established as a function of the vegetation species, climate, hydrologic performance of soil, and hydraulic performance of the irrigation system.

3.0384, A PHYSICAL AND ECONOMIC ANALYSIS OF ALTERNATIVE IRRIGATION METHODS IN A SUB-HUMID CLIMATE

E.C. STEGMAN, North Dakota State University, Agricultural Experiment Sta., Fargo, North Dakota 58102

Objective: To evaluate alternative methods of irrigation for the purpose of identifying the design or designs which maximize returns to resources in a sub-humid climate.

Description of Work Proposed: Available crop water use data will be analyzed to develop techniques for estimating the evapotranspiration term in the daily water balance model to be employed in succeeding steps. Available crop yield and associated climatic data will be analyzed to develop production functions for potentially irrigable crops, i.e., yield data will be related to climatic or drought indices. A range of irrigation systems will be artificially applied to all combinations of a set of farm unit sizes, soil moisture storage capacities and crop rotations characteristic of proposed irrigation districts in Garrison Diversion unit. For each combination, irrigation programs will be synthesized for a significant period of climatic record by injecting an irrigation system of specified design or capacity into the water balance model by way of the irrigation term. The estimated yield distribution or expected return data, labor, operating, and investment costs associated with each of the irrigation systems and programs will provide the basis for an economic analysis.

3.0386, MULTICOMPONENT MEMBRANE FOR REVERSE OSMOSIS

D. MCINTYRE, Univ. of Akron, Institute of Polymer Science, Akron, Ohio 44304

Theoretical and experimental studies of the mechanism of water transport in membranes used in reverse osmosis will be undertaken. Both block polymers and mixed polymers will be used. The polymer compositions will be tailored to include known amounts of hydrophilic and hydrophobic constituents. Also different types of intermolecular attractions will be allowed to simulate the semi-crystalline properties of cellulose acetate. The thermodynamic and transport properties of these membranes will be studied. The results of these studies are expected to allow improved reverse osmosis membranes.

3.0387, PREPARATION OF SMALL TUBES AND THE DETERMINATION OF THEIR PROPERTIES FOR REVERSE OSMOSIS

E.A. MEINECKE, Univ. of Akron, Institute of Polymer Science, Akron, Ohio 44304

The influence of the processing variables on the structure of small tubes of materials suitable for reverse osmosis; and the influence of the structure of the tubes on their mechanical properties and permeability is studied. Techniques for design and construction of efficient reverse osmosis configurations are developed. The study will involve (a) design and construction of extrusion and stretching equipment for making tubes approximately 0.001 inch in diameter, (b) preparation of tubes under various fabrication conditions, (c) characterization of tubes under varying operating conditions, (d) determining mechanical properties of the tubes, and (e) determining permeability of the tubes.

3.0388, STUDIES ON THE MOLECULAR STRUCTURE OF BIOLOGICAL MEMBRANES

J.E. ZULL, Case Western Reserve Univ., Graduate School, Cleveland, Ohio 44106

Research on the structure and properties of biological membranes and model biological membranes is being carried out. The natural membrane currently under investigation is the red-blood cell ghost. Glucose transport sites are being investigated and proteins associated with these sites will hopefully be isolated. Radioactive tracer techniques are being used for this work.

C14 and H3 labeled hormones are being prepared (insulin, vasopressin), and will be used in attempts to identify and isolate transport protein involved in their action.

The model systems are primarily bimolecular leaflets of phospholipid and cholesterol, studied either directly or as suspensions in aqueous media. ATR spectroscopy is the primary tool currently being used for this work. The association of tracer labeled proteins with these model systems will be investigated as the model of lipid-protein interaction in biological membranes.

The primary aim of the work is to elucidate the structure of biological membranes at the molecular level, and the nature of the proteins involved in transport function in such membranes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0389, FOAM FRACTIONATION

J.J. BIKERMAN, Horizons Incorporated, Cleveland, Ohio 44104

The ultimate objective of this study is development of the methods of foam fractionation and ion flotation for recovery of useful minerals and potable water from the sea or brackish

waters. At present, it is intended to investigate the following processes: 1. Extraction of iron and manganese with anionic surfactants; the efficiency and the economics of the operation will be considered. 2. Extraction of calcium and magnesium with several commercial surfactants at various acidities. 3. Extraction of iron from solutions containing both ferrous and calcium ions and simultaneous extraction of iron and calcium from these solutions. 4. Extraction of potassium using surface-active derivatives of tetraphenylboron and 4,6-dinitro-2-octylphenol.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0390, SCALE CONTROL WITH GRAPHITE HEAT-TRANSFER TUBES OF CONTROLLED PERMEABILITY TO STEAM

L.E. VAALER, Union Carbide Corporation, Cleveland - Parma, Ohio

The objective of the proposed contract is to investigate a possible method of preventing scale in the distillation of saline water to produce potable water by taking advantage of the inherent permeability of heat-transfer tubes made from graphite. If a small portion of the steam condensate seeps through the wall of a graphite tube, the static film on the brine side, will presumably be diluted to a level of calcium sulfate super-saturation below that needed for scale formation. The investigation will involve three experiments with the LTV falling film evaporator, employing a temperature of 275 degrees F on the steam side and a vaporization temperature of 265 degrees F on the falling film side of the tube. The experiments will be carried out with unconcentrated synthetic sea water containing components that will normally deposit CaSO₄ and alkaline scale.

Specific objectives of this investigation are to compare the performance of an impervious tube and a permeable tube employing a vaporization temperature of about 265 degrees F on the falling film side of the tube to investigate the possibility of preventing alkaline scale using permeable graphite tubes.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0391, INVESTIGATION OF THE USE OF LOW-COST PLASTIC FILMS FOR SOLAR STILL CONSTRUCTION

J.A. EIBLING, Battelle Memorial Institute, Columbus, Ohio 43201

The objectives of this program were to determine, by means of a design study, the feasibility of using the very low-cost plastic films, such as polyethylene and polyvinyl chloride, as cover materials for large solar stills. This investigation was prompted by the good progress made in recent years in improving the weatherability of these films through the incorporation of various additives which provide some protection against deterioration caused by ultraviolet radiation.

Preliminary economic studies had shown that these films, because of their very low cost, might be suitable for solar stills even though their anticipated useful life was not more than one year. The approach taken during this study was to consider various still designs, choose one design well suited to the low-cost, short film life philosophy and make a thorough evaluation of this design. Samples of a few plastic films were exposed at a Florida site in fixtures simulating solar still conditions to supplement the information on film life available through other sources.

The results of the design study indicated that there was little or no economic advantage in using the low-cost films. Even if the useful life of the film is assumed to be one year, which the exposure tests during this program indicated is probably too optimistic, the low-cost films such low mechanical strength that a relatively thick film is required to withstand the anticipated structural loads. As a result, the film cost is high enough that the product water cost from such a still would be no lower than one would expect from a glass-covered still.

3.0393, RELATION OF CLIMATIC AND WATERSHED PHYSIOGRAPHIC AND CULTURAL FACTORS TO WATER YIELD

L.L. HARROLD, U.S. Dept. of Agriculture, *Coshocton, Ohio*

Object: To identify the climatic and watershed factors influencing water yield of agricultural watersheds, both stream flow and ground water components; to evaluate the factors quantitatively; and to develop simple procedures by which the seasonal and annual net yield of water from ungaged watersheds may be reliably estimated for both local and downstream uses.

Plan of Work: Work is currently concentrated on the North Appalachian Experimental Watershed near Coshocton, Ohio; on agricultural watersheds in the vicinity of Fennimore and Madison, Wisconsin; and at Columbia, Missouri. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape and other geomorphic attributes of the watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

3.0394, AQUIFER AND SUBSURFACE RELATIONSHIPS IN THE HYDROLOGY OF UPSTREAM AGRICULTURAL WATERSHEDS

L.L. HARROLD, U.S. Dept. of Agriculture, *Coshocton, Ohio*

Object: To develop procedures for estimating subsurface contributions to streamflow, transmission losses in stream channels and valleys, and groundwater movement and recharge in relation to watershed geology, soils, climate, land use, and other characteristics.

Plan of Work: The work is currently in progress at the North Appalachian Experimental Watershed near Coshocton, Ohio and from headquarters at Madison, Wisconsin and Columbia, Missouri. The investigations include: geologic mapping; ground water observations; soil moisture determinations; transmission capacities of soils and aquifers; and the consideration of influent and effluent streamflow.

3.0397, INCREASING WATER SUPPLIES BY SUPPRESSION OF RESERVOIR EVAPORATION

F.R. CROW, Okla. St. Univ. of Agr. & Sci., School of Agriculture, *Stillwater, Oklahoma 74075*

The general objective of this research is to study the broad problem of evaporation suppression methods using small experimental reservoirs as the principal test environment. A specific objective is to determine the evaporation retarding efficiency of monomolecular films and floating plastic membranes in relation to the proportion of total water surface covered by the evaporation retardant. The results of this research will have application in determining the accuracy of procedures for estimating evaporation suppression which are based on estimates of partial film cover.

Tests will also be made to determine the effect on evaporation resulting from disturbing the thermal gradient of small reservoirs by pumping, bubbling, or related techniques.

3.0398, THE HYDRAULICS OF SPATIALLY VARIED STEADY FLOW IN AN IRRIGATION DISTRIBUTION CHANNEL WITH FURROW OUTLETS

J.E. GARTON, Okla. St. Univ. of Agr. & Sci., School of Agriculture, *Stillwater, Oklahoma 74075*

The objectives of this project will be: 1. To determine the discharge characteristics of weirs, orifices, and short tubes installed in the side of a trapezoidal channel. 2. To evaluate the energy losses in the channel and determine values of roughness coefficients for a system of multiple furrow outlets. 3. To determine the distribution uniformity of irrigation systems in which weirs, orifices, and hooded inlet tubes are used to distribute the water in furrows. 4. To develop methods of predicting the water surface profiles and the distribution uniformity of irrigation systems in which discharge occurs through weirs, orifices, and short tubes.

The proposed experiments will be conducted in an existing horizontal concrete-lined irrigation channel, equipped so that the inflow and the resulting water surface profile is 320 feet long and has dimensions that are standard in current irrigation practice.

3.0399, PLANT POPULATION EFFECTS ON THE EFFICIENT USE OF WATER

J.F. STONE, Okla. St. Univ. of Agr. & Sci., School of Agriculture, *Stillwater, Oklahoma 74075*

Two years of preliminary studies in Oklahoma have shown that peanuts can be grown in narrow rows with an attendant increase in yield and quality. Water requirement for the increased production did not increase or even reduced (in one of the years). No micrometeorological measurements were made so the mechanisms responsible for the efficiency of water use are not known. The proposed study would characterize water loss both aerodynamically and from an energy budget standpoint. Degree of transferability of the information to other plants and regions will be sought.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Objectives: 1. Study aerodynamic and energy factors tending to cause water loss in peanuts cropped at economically high population levels. 2. Investigate and identify the factors tending to cause the observed reduction (or at least constant) water loss from peanuts as population increases. 3. Investigate the possibility for cropping with reduced water loss.

Procedures: Plant population will be varied by using different row spacings. Aerodynamic and energy factors will be obtained through measurement of such micrometeorological variables to determine energy budget and aerodynamic roughness and potential evapotranspiration. Reflectance of the field surfaces (crop and soil) condition of the plant stomates will be recorded.

If the foregoing measurements offer an explanation for the water loss efficiencies noted in the past, the causative factors will be manipulated for further enhancement during the later phases of this study. They can also be studied for transferability to other plants and other regions.

3.0400, USE OF REACTOR COOLING WATER FROM NUCLEAR POWER PLANTS FOR IRRIGATION OF AGRICULTURAL CROPS

L.L. BOERSMA, Oregon State University, School of Agriculture, Corvallis, Oregon 97331

The proposed research plan involves laboratory investigations directed at determining the feasibility of using water heated in nuclear power plants for irrigation of agricultural crops. The main approach in the proposed investigations is to determine the influence of soil temperature and heated water on rates of photosynthesis, transpiration and respiration under controlled laboratory conditions.

Methods employed are: A special experimental arrangement has been designed in which soil water content and soil temperature can be maintained constant or can be varied at a programmed rate. Above ground conditions can be maintained constant or can be varied at a programmed rate independent of below ground conditions. The rates of photosynthesis, transpiration and respiration can be monitored on a continuously recording basis or measured at certain time intervals. The experimental arrangements provides for the simultaneous observation of 34 separate plant systems.

3.0401, IMPROVING IRRIGATION WATER SUPPLY FORECASTS AND THEIR USE

B.L. WHALEY, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

A. To adopt methods of soil moisture measurement to Oregon mountain soils to obtain indices of soil moisture. B. Preparation of hydrologic data for machine processing. C. To improve water supply forecast methods. D. To study the effect of frost in the soils to runoff.

Locate and install soil measuring devices in areas of limited snow fall and determine the water holding capacity of the soils. Take readings on these sites often enough to be of value in correcting forecasts for soil moisture deficiency. Snow survey data will be punched on cards after each season so that this data deck may be used to print up-to-date summaries of all data measured in Oregon. All forecast procedures will be reviewed and available data and techniques studied for the improvement of forecast equations. Measurements of frost penetration will be taken at soil moisture stacks and other selected locations over the state and a comparison made of watershed yields from frozen and unfrozen soils.

SUPPORTED BY Oregon State Government

3.0402, THE ADAPTATION OF SPRINKLER IRRIGATION TO SOILS OF LOW INTAKE RATE

J.W. WOLFE, Oregon State University, Agricultural Experiment Sta., Corvallis, Oregon 97331

To develop a procedure for determining the optimum sprinkler application rate on low intake rate soils. To determine the adaptability of sprinkler equipment with modification if necessary for applying water at the required low rate.

Progress to Date. A prediction equation for the time required for ponding to appear under irrigation sprinklers on amity silt loam planted to pasture, was developed from field measurements made during two seasons. It was found that time to pond could be predicted if one knows the initial soil moisture content and the application rate from the sprinklers.

In a second series of experiments, the percentage of ponding of the surface was permitted to increase on graded plots and on flat plots. The uniformity of distribution of moisture in the soil after irrigation was lowered on the graded plots.

SUPPORTED BY Oregon State Government

3.0403, THE MEASUREMENT OF EVAPORATION AND CONDENSATION COEFFICIENTS OF WATER UNDER EQUILIBRIUM CONDITIONS

R.W. COUGHLIN, Lehigh University, School of Engineering, Bethlehem, Pennsylvania 18015

Accommodation coefficients of water will be measured using tritiated water as a tracer. This will permit the determination of these coefficients under equilibrium conditions. The following systems will be investigated: 1. liquid water - water vapor 2. ice - water vapor 3. liquid water - water vapor, in the presence of foreign gases 4. adsorbed water - water vapor.

3.0405, POLYMERIC COATINGS FOR PROTECTION ON CONCRETE EXPOSED TO AQUEOUS SALINE ENVIRONMENTS

J. MANSON, Lehigh University, Institute of Research, Bethlehem, Pennsylvania 18015

This research program is for the investigation of basic factors affecting the adhesion of polymer coatings to concrete during exposure to a saline water environment. Factors to be considered include: (1) adhesion and debonding at the polymer-concrete interface and the effects of certain functional groups as adhesion promoters; (2) permeability of the film to moisture and ions and the effects of these on the polymer-concrete interface; and (3) physical and chemical degradation of the polymer itself.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0406, DEVELOPMENT OF DESALINATION MEMBRANES

N.D. FIELD, G A F Corporation, Easton, Pennsylvania 18042

The program will be devoted to the fabrication of water insoluble membranes based on polymers of vinylpyrrolidone and/or vinyl ethers. Among variables under consideration will be type and ratios of comonomers and degree of crosslinking. Random, graft and block copolymers will be synthesized. Blends and composite membranes will be fabricated. Some of these will be based on the tendency for vinylpyrrolidone-containing polymers to form complexes with carboxyl-containing polymers. For example, PVP solutions and poly (alkyl vinyl ether/maleic anhydride) solutions on mixing form insoluble coacervates. These on drying form water insoluble, tough materials. It is envisaged that multiple layered films can be prepared using this phenomenon. Sandwich

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

structures will be prepared in which the hydrophilic hydrophobic balance of each layer will be a variable. In this fashion, membranes with a range of water flux and salt rejection should be possible. Optimum polymer mixtures and film composite structures will be chosen. The physical and mechanical properties of the membranes will be evaluated. Water flux and salt rejection will be utilized as screening tools. The best membranes will undergo intensive physico-chemical studies.

3.0407, IMPROVEMENT OF ECONOMICS OF ELECTRODIALYSIS SYSTEMS BY SELECTIVE PRETREATMENT *E.C. SPITZER, Crane Company, King of Prussia, Pennsylvania 19406*

The four main objectives of this contract are: to develop effective and economical pretreatment methods for electrodialysis plants treating highly contaminated brackish surface waters; to characterize commercially available ion-selective membranes to determine the degree of their resistance to fouling by organics and other contaminants; to evaluate the overpotential static cell test as a means to predict the fouling tendency of an electrodialysis system treating highly contaminated brackish surface waters; and to develop a procedure for concentrating foulants in brackish ground waters in the field, suitable for use in conjunction with the overpotential static cell test.

The work to be accomplished includes the assembly and construction of the test units, laboratory testing and characterization, operation field testing, foulant concentration studies, and analysis of the test data.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0408, IMPROVEMENTS IN DESALINATION BY THE FLASH EVAPORATION PROCESS *R.A. TIDBALL, Baldwin Lima Hamilton Corp., Philadelphia, Pennsylvania 19142*

Two pilot plants are in operation. The 3 stage plant, a full scale 21 inch wide portion of a commercial flash evaporation desalination plant, is providing data on various plant parameters including interstage orifice coefficients, flashing efficiency, and non-equilibrium phenomena in the flash chambers. This pilot plant is fully instrumented for the very accurate measurement of temperatures, pressures, and fluid flows. Temperatures are measured by means of platinum resistance thermometers. Data points are automatically sequenced by a data logger, and results are rapidly recorded on punched cards.

A 16-stage pilot plant, simulating one-third the stages of a full-scale commercial plant, has been giving a valuable insight into the mechanism of scale formation during the distillation of sea water. During the past year, scale prevention techniques tested in this plant included acid addition and the use of additives to the feed stream. This plant has just been modified to incorporate a fluidized bed for the prevention of the deposition of scale on heat transfer surfaces. In addition, systems are being appended for the testing of slurry addition and also of ion exchange pretreatment of the feed.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0409, EVALUATION OF BRINE DESULFATING PROCESS AS APPLIED TO FEEDWATER FOR DESALINATION PLANTS *C.E. ENNIS, Catalytic Construction Company, Philadelphia, Pennsylvania 19102*

An evaluation of a desulfating process conceived at the Department of Interior, Bureau of Mines Metallurgy Research Center, Salt Lake City, Utah, for application to feedwater supplied to large (50 MGD) desalting plants. The process was analyzed to determine the maximum brine temperature which could be used in a desalter operating on the desulfated feed. Flow sheets and equipment selections were made for a plant to supply feedwater to a 50 MGD desalting plant. Flow sheets and specifications (OSW Specification 1822) were prepared for a pilot plant to be installed and operated at OSW's Wrightsville Beach Test

Center. An analysis of plant capital and operating cost is included, together with projected income from sale of by-product sulfuric acid, caustic soda, and soda ash indicates that the desulfating process could return a credit to the desulfating-desalting complex equal to \$.07 per 1000 gallons of desalted product water.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0410, EVALUATION OF HIGH PRESSURE PUMPS FOR REVERSE OSMOSIS PROCESS *J.W. PETERSON, Catalytic Construction Company, Philadelphia, Pennsylvania 19102*

The objectives of this program are to evaluate the suitability of commercial high pressure pumps for use in multi-million gallons per day brackish and sea water reverse osmosis plants, and to develop pump maintenance procedures that will significantly cut down plant down time.

Four phases of work are to be accomplished. These are pump selection; design and fabrication of test loops; pump evaluation; and recommendations and preparation of the final report.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0411, DEVELOPMENT OF PERMANENT SYSTEMS FOR DROPWISE CONDENSATION *R.A. ERB, Franklin Institute, Philadelphia, Pennsylvania (14-01-0001-744)*

This program is aimed toward obtaining increases in heat transfer in distillation processes for desalination through the development and application of permanent systems for dropwise condensation on condenser surfaces. One dropwise system being studied involves the use of thin films of noble metals (e.g., gold with silver underlayer); another system is based on the parylenes (vapor-deposited polymers). Other possible permanent systems are also being investigated. The program, with a goal of the development of high-performance, low-cost systems, consists of several areas of study: 1) screening tests, for studying the dropwise behavior new or improved systems under continuous condensing conditions; 2) engineering tests and studies with small pilot plants, using steam generated from seawater and involving heat-transfer measurements and studies on the effect of aging, inundation, contamination, etc.; 3) fundamental studies on microcondensation phenomena; 4) cooperation toward dropwise condensation studies in larger-scale units for seawater distillation, with the aim of demonstrating performance under actual plant operating conditions. Preparations have been made for testing dropwise systems in a special unit at the Clair Engle plant, Chula Vista, California, and in a G.E./Navy still at Wrightsville Beach, North Carolina.

3.0413, MAXIMUM RATE OF VAPORIZATION AND CONDENSATION OF WATER WITH DISSOLVED SALTS AND SURFACE CONTAMINATION *L.C. EAGLETON, Univ. of Pennsylvania, School of Engineering, Philadelphia, Pennsylvania 19104*

The objective of the research is to measure the rate of evaporation or condensation, expressed in terms of the condensa-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

tion coefficient, of water to which sodium chloride, a surface active material or a monomolecular film on the surface has been added. These experimental data will be compared to those of pure water. The research proposed here is an extension of that performed under OSW Grant No. 14-01-0001-462 titled 'Maximum Rate of Vaporization and Condensation of Water'.

Determination of the coefficient for salt water should enable this research to determine if dissolved salts inhibit the rate of vaporization of water other than through the vapor pressure lowering. Monomolecular films applied to the surface strongly retard evaporation but very small quantities of contaminants can destroy the action of these films. In view of this, the dissolved electrolytes and organic molecules that might collect at the surface of sea water are of particular interest. Previous measurements of the evaporation rates through monomolecular films have been limited to studying relative rates since the main resistance to evaporation has been the gas diffusion layer. The apparatus used in the previous grant and to be incorporated in this effort is unique in that it determines the absolute coefficient from a flat, stagnant liquid surface with no gas film resistance.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0414, STRUCTURE OF SEMIPERMEABLE POLYMER FILMS AND ITS EFFECT ON SALT REJECTION *T.G. FOX, Carnegie Mellon University, Mellon Institute, Pittsburgh, Pennsylvania 15213 (14-01-0001-1648)*

The relationship of the morphological structure and chemical makeup of polymeric films to their effectiveness as membranes in salt rejection filtration is to be studied. The effect of the local morphology of the film on its salt filtration properties is one of the principal variables to be investigated. The nature and amount of crystalline order, orientation of crystalline regions, effects of inorganic and organic additives on crystalline properties of films and the morphology of void and channels will be investigated. It is expected that a variety of methods including light scattering, x-ray diffraction and electron diffraction will have to be employed in these studies. It is anticipated that in some filtration membranes, the degree of order, or departure from completely random mixing of the polymer chains, will be low. The identification and correlation of this type of order to salt rejection efficiency is one of our goals. In addition, the effects of chemical structure of the polymer repeat unit, of molecular weight, molecular conformation, molecular weight distribution and similar characteristics at the molecular level will be considered.

3.0416, REVERSE OSMOSIS MEMBRANES CONTAINING GRAPHITIC OXIDE

D. BERG, Westinghouse Electric Corp., Pittsburgh, Pennsylvania

This contract continues the study initiated in June 1965 for investigating graphitic oxide as a possible membrane material in desalting water by the reverse osmosis process. Work during the past year demonstrated that thin (0.3 micron) films of graphitic oxide exhibited desalination properties with feed brines containing from 0.2% to 4.0% NaCl and operated over a pressure range

of 300 psi to 1700 psi. Improved membrane-forming techniques were developed and water flux rates up to 18.4 gal/ft²-day (77% salt rejection, 2.0% NaCl, 1700 psi) and salt rejection up to 85% were measured during a 390-hr run.

The continuation of these studies includes: (1) exploration of techniques for producing larger membranes from the present graphitic oxide without introducing more flaws or diminishing the reproducibility; (2) investigation of methods for scaling-up the preparation of bulk quantities of graphitic oxide; (3) further experiments in characterization of graphitic oxide membrane performance as affected by variables in reverse osmosis operating conditions; (4) modification of the present graphitic oxide and evaluation of desalination capability after modification; and (5) investigation of other inorganic membrane materials.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0417, INVESTIGATION OF DESALINATION BY FREEZING

D.R. HAMILTON, Westinghouse Electric Corp., Pittsburgh, Pennsylvania

The studies of the freezing of water to be conducted in this investigation fall in two categories: interface morphology studies and interaction effects in solute partitioning. The interface morphology studies are directed at characterizing quasi-steady-state growth forms; freezing interfaces which are not stable, but which may persist for long periods of time. Two examples are the cellular interface and the 'forest of dendrites' interfaces. The objective of the study in this area will be a theoretical analysis of the morphology and growth mode of the interface, especially in regard to macroscopic solute incorporation.

The studies of impurity interaction effects will be concerned with the partitioning of solute between the solid and liquid on a microscopic or molecular scale. The emphasis will be directed at the solute generated bonding defects in the solid and the resulting contribution of these defects to the system's free energy. Phenomena specific to interfacial regions may also be included if deemed appropriate as the work progresses. The approach to this problem will be both theoretical and experimental.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0418, DEVELOPMENT OF A LOW-COST IRON-BASE ALLOY TO RESIST CORROSION IN HOT SEA-WATER

N. PESSALL, Westinghouse Electric Corp., Pittsburgh, Pennsylvania

The proposed 12 month program will involve alloy development, corrosion testing and metallographic studies. The basic objective of the alloying additions will be to promote formation of passive films based on the current knowledge of corrosion-resistant iron-base alloys, on alloy economics and on current theories of the mechanism of passivation. Evaluation of the corrosion characteristics will be made using both electrochemical and loop test measurements, but emphasis will be laid heavily on potentiostatic and potentiokinetic studies. The corrosion tests will be made as functions of temperature, pH, Cl⁻ ion activity, degree of aeration, alloy heat treatment and composition. Studies of pitting potentials will be made and correlated with loop-test data. Alloy specimens will be examined after corrosion testing using both light and electron microscopy. The metallographic investigations will be aimed at evaluating the influence of grain boundary characteristics, the nucleation, frequency and depth of pitting, and the influence of crystallographic orientation.

3.0419, WATER YIELD IN RELATION TO CLIMATIC & WATERSHED CHARACTERISTICS OF LAND

E.T. ENGMAN, Penn. State University, U.S.D.A. Ne. Watersh. Res. Ct., University Park, Pennsylvania 16802

Object: To identify the climatic and watershed factors of land resource areas of the Northeast that influence water yield from agricultural watersheds; develop procedures for estimating surface and subsurface contributions to streamflow from parameters of climatic and watershed characteristics; and develop

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

procedures and possible formulas to reliably estimate seasonal and annual water yields.

Plan of Work: The work is currently concentrated on the Sleepers River Experimental Watershed near Danville, Vermont; the Northeast Watershed Research Center, University Park, Pennsylvania, and on other agricultural watersheds in Virginia. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season; soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels; and the size, shape and other geomorphic attributes of the watersheds.

SUPPORTED BY U.S. Dept. of Agriculture

3.0420, WATERSHED CORRELATION AND SYNTHESIS

H.W. LULL, U.S. Dept. of Agriculture, Upper Darby, Pennsylvania

Object: To assemble, correlate, and synthesize forest watershed information for the prediction of the effects of forest watershed management practices on streamflow by major physiographic regions of the eastern United States; and through research on municipal watersheds and correlative information determine the practices that will meet municipal water-yield and water-quality management needs.

Plan of Work: Using longtime streamflow records from northeastern watersheds, this program will determine the hydrologic function of forest cover on yield and distribution of streamflow, the effects of historical changes in land use, and the effects of historical changes in land use, and the effects of present-day land use. It will also evaluate the present system of determining hydrologic conditions of forest land for river basin planning and flood prevention programs. In municipal watershed research, the staff will determine the effects of forest land treatment on increasing water yields through the use of numerous cooperative watershed studies.

3.0421, DESIGN AND ECONOMIC STUDY OF A GAS TURBINE POWERED VAPOR COMPRESSION PLANT FOR EVAPORATION OF SEAWATER

H. WIGHTMAN, Struthers Energy Systems Inc., Warren, Pennsylvania

The study of two sizes of gas turbine drivers was conducted and a 12,500 SHP, dual shaft, gas turbine driver was chosen as the main power train. The plant is designed to produce 8.0 MGD. The cycle uses a VTE and a MSF unit in series. The gas turbine driven axial flow vapor compressor operates across 4 effects of the VTE. Gas turbine exhaust heat is recovered in a heat recovery boiler. Only on-site power is generated in the back pressure turbine rated from 1500 KW. The water cost developed for the plant is \$0.39/1000 gal. The total capital cost of the plant is approximately \$7,500,000. Drawings showing VTE tube sheet configurations and general outlines are provided. A heat and material balance is provided. Vendors' bids received from plant equipment are provided.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0422, SEASONAL VARIABILITY OF SOIL MOISTURE AND LEVELS OF GROUNDWATER TABLE ON LOWLAND AREAS

S. OSTROWSKI, Forest Research Institute, Warsaw, Poland

Plan of work: The field work will be done in three regions of Poland where stands of pine are established on sandy soils. Important environmental factors to be measured include precipitation; interception; soil and air temperatures; ground water levels; and soil moisture by gravimetric and lysimetric methods. Water balance computations will be made under several site and meteorological conditions. Laboratory research carried out in the greenhouse under controlled conditions of temperature, humidity, and precipitation will be used to strengthen and interpret the results from field research.

SUPPORTED BY U.S. Dept. of Agriculture

3.0423, REACTIONS BETWEEN MINERAL AND ORGANIC COMPONENTS IN SOIL.

B. SWIETOCHOWSKI, Coll. of Agriculture, Wroclaw, Poland

Object: To determine (1) the nature of the reactions between mineral and organic soil fractions, (2) the influence of these reactions on macro and micro soil structure, and (3) the indirect effect of soil structure on soil moisture and soil strength.

Plan of Work: A study will be made of the reactions between mineral and organic fractions of soil and the influence of these reactions on the macro and micro structure of the soil, emphasis being placed on reactions resulting from long time soil management practices that are presumed to be in equilibrium with the environmental and management conditions. This information is required to develop cultural practices and cropping systems conducive to sustained agricultural use of soil and water resources and as a guide to soil and water conservation practice development in different soil and climatic conditions where soil structure problems exist. Thin sections of soil structure developed from long time tillage and rotation experiments will be prepared and optical procedures will be used in characterizing the nature of reactions and influence of these reactions on micro structure. The indirect effects of such structural arrangement will be evaluated in terms of structural stability and the interactions of structure and soil moisture in terms of moisture retention and soil strength.

SUPPORTED BY U.S. Dept. of Agriculture

3.0424, WATER REQUIREMENTS BY SUGARCANE UNDER IRRIGATION

R. VAZQUEZ, Univ. of Puerto Rico, Agricultural Experiment Sta., Lajas, Puerto Rico

Two experiments will be conducted to study the water requirements of sugarcane under irrigation.

In one of these experiments the effect of 20 different soil moisture treatments on the consumptive use of water, yields and sucrose content of sugarcane will be studied. The interaction between fertilizer and water application also will be studied. Two levels of irrigation controlled with tensiometers and gypsum resistance blocks will be established. These irrigation treatments will be discontinued at 6, 5, 4, 3, 2, and 1 month prior to harvest, being irrigated with less frequency thereafter.

Another experiment will be conducted to correlate different levels of plant-tissue water content with cane yields and sucrose content in order to find a plant moisture index to control irrigations.

SUPPORTED BY U.S. Dept. of Interior - O. Water Res. Res. University of Puerto Rico

3.0425, LAND FORMING FOR IRRIGATION AND DRAINAGE IN SUGARCANE PRODUCTION UNDER PUERTO RICAN CONDITIONS

W.F. ALLISON, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

To determine the practicability and feasibility of land-forming irrigated sugarcane soils in Puerto Rico. To determine the maximum depth of cuts allowable in the various irrigated soils that will not materially affect production. To determine the optimum gradients of furrows or borders. To determine the optimum length of runs for border and furrow irrigation systems. To compare planting of sugar-cane in furrows versus planting on the bed.

DESCRIPTION OF WORK: Data on plots leveled to a uniform plane surface will be assembled to determine the effects of the land forming operation on crop yields, the rate of recovery of the soil to normal production levels, and the land treatment needed to restore productivity following land forming. Also, these plots will be further used to determine the design criteria for gravity irrigation systems in Puerto Rico. Statistically designed field experiments will be performed in an attempt to verify the above-mentioned objectives. The results of these experiments will

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

be interpreted and the conclusions therefrom will be published as journal articles or in bulletin form.

3.0426, RECLAMATION OF SALTY LANDS IN PUERTO RICO

E.J. BRENES, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

1. To determine the sodium content in the salty lands of Puerto Rico. 2. To determine the salt tolerance of crops that may be grown in the salty lands of Puerto Rico. 3. To determine practical means for the reclamation of the salty lands of Puerto Rico.

Description of work: Efforts will be focused toward the development of a rapid, practical, and economical method for the reclamation of the saline-sodic-soils of Lajas valley. Amendments such as sulfur, calcium chloride, bagasse, rum distillery slops, and molasses, providing water for irrigation and good drainage, will be used until the soil profile of the saline-sodic soil is converted to a normal soil.

A third experiment with Bermuda grass as a crop and different levels of sulfur, under irrigation and drainage, will also be used for reclamation.

Finally, sea water, salty or brackish water, will be used as a possible method to leach the sodium from the sodic soil as recommended by Reeve and Bower (Soil Sc. 90(Z): 130-144, Aug. 1960).

Puerto Rico Government

3.0427, FARM MANAGEMENT STUDY OF THE SUGARCANE FARMS SERVED BY THE LAJAS VALLEY IRRIGATION DISTRICT

A.A. LLORENS, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

OBJECTIVES: (1) Obtain input-output data for sugarcane farms served by the Lajas Valley Irrigation District. (2) Determine the ability to pay water charges of these farms.

DESCRIPTION OF WORK: Sugarcane farmers served by the Lajas Valley Irrigation District will be interviewed to obtain quantitative input-output data for the 1966-67 and 1967-68 crop years. Information thus gathered will be analyzed considering factors such as the economic position of the farm, the value of the output attributable to water use, soil classification, farm size, number of acre-feet of water used, the presence of salinity problems, and if water was gravity fed or applied through pumping.

SUPPORTED BY Puerto Rico Government

3.0428, THE LOSS OF FERTILIZERS BY LEACHING FROM THE SOILS OF PUERTO RICO

G. SAMUELS, Univ. of Puerto Rico, Agricultural Experiment Sta., San Juan - Rio Piedras, Puerto Rico 00931

To measure and collect leachings from various soils while used to produce economic crops. 2) To determine the chemical composition of the leachings so as to measure the plant nutrients lost by leaching. 3) To determine how the method and time of application and form of fertilizer influences the loss of fertilizer nutrients by leaching.

DESCRIPTION OF WORK: By means of special lysimeters constructed in the field the loss of fertilizers in the soils by leaching will be studied throughout the life of the crop in order to determine how the method and time and form of fertilizer application influence these losses.

SUPPORTED BY Puerto Rico Government

3.0429, SMALL DESALINATION UNIT TO TEST SCALE REDUCTION ADDITIVES

N. MADSEN, Univ. of Rhode Island, School of Engineering, Kingston, Rhode Island 02881

In order to determine economic factors involved in evaluation of scale reduction additives in evaporative desalination

processes, it is proposed that a bench-size evaporator be constructed with the heating surface of stainless steel and jacket of pyrex glass for observation.

Additives to be tested include those found in a current study which produce a normal rather than an inverted solubility behavior for calcium sulfate and also others which seem to produce different crystalline forms with less tendency to scale formation.

Following construction of the unit, experimental work will involve continuous operation with varying concentrations of different additives to determine rates of heat and mass transfer, rate of scale build-up and comparative costs.

3.0430, GROUNDWATER RECHARGE

C.M. PATTERSON, U.S. Atomic Energy Commission, Savannah River Plant & Labs., Aiken, South Carolina

Water table fluctuations are the result of variations in climatic factors. A study is in progress to determine the reliability of calculating ground-water elevation fluctuations using available climatic data. For 4 years, monthly water level measurements have been made in 47 wells distributed over 10 square miles at SRP. The Southeast River Forecast Center, U. S. Weather Bureau in Augusta, Ga., collects climatic data for river forecasting. These data were used to calculate the volume of groundwater recharge, which in turn was used to calculate the change in the water table evaluation. The calculated values will be compared with measured values.

SUPPORTED BY U.S. Atomic Energy Commission

3.0431, HYDROLOGY AND MANAGEMENT OF WETLAND FORESTS

R.A. KLAUITTER, U.S. Dept. of Agriculture, Charleston, South Carolina

Object: To develop effective water control and soil management techniques through increased knowledge of the hydrology, soil properties, and soil-water-plant relations of wetland forests.

Plan of Work: The program will concentrate its effort on wet flatlands and pond pine bay-pocosins. These wetland types have the greatest potential for forest growth improvement by water control. The project staff will conduct studies in three fields of work: (1) wetland forest hydrology, in which the water balance will be measured to determine amount and timing of surplus water; (2) soil-water-plant relations, the effect of soil and water availability on evapotranspiration; and (3) engineering and soil management including the development of water control techniques, land leveling, prescribed burning and fertilizing to improve forest growth.

3.0432, SOLID COORDINATION COMPOUNDS OF ALKALI METAL SALTS

N.P. MARULLO, Clemson University, Graduate School, Clemson, South Carolina 29631

An investigation will be conducted on the solid compounds formed by precipitation from aqueous solution of p,p'-diamino-2,3 diphenylbutane and alkali metal salts. Experiments will be directed to establish the structure of these compounds and to evaluate the significance of the size and charge of the ionic species and the requisite structural and electronic features of the organic material. A variety of other parameters which may influence the extent and specificity of this phenomenon and the extent to which these compounds exist in solution will be investigated.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0433, EVALUATION AND FUNCTIONAL OPERATION OF IRRIGATION SYSTEMS

D.D. BROSZ, South Dakota State University, Water Resources Institute, Brookings, South Dakota 57007

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The objective of the study is to obtain information for the development of procedures to improve present irrigation practice, future irrigation management, and system selection.

The project will be initiated with a water application efficiency study which will be carried out on several sites throughout Eastern South Dakota. The main goal of this is to be able to supply the irrigator with information so that he may properly time a water application and apply the proper amount of water to insure a high irrigation efficiency.

A study will also be made of the distribution patterns of various automated and semi-automated systems and whether a relationship exists between application rate and crop yield. Along with the above studies an evaluation of the various irrigation systems will be made as to the labor required.

The project will then concentrate on how all this information could be coordinated and funneled to the individual irrigator.

South Dakota State University

3.0434, EFFECTS OF MARGINAL QUALITY IRRIGATION WATER ON THE ACCUMULATION OF SALTS AND ALKALI IN SOUTH DAKOTA SOILS

W.D. LEMBKE, South Dakota State University, Water Resources Institute, Brookings, South Dakota 57007

The purpose of this research is to determine the effects of marginal quality irrigation water on the salt and alkali accumulation in soils peculiar to the sub-humid climate existing in South Dakota.

The approach used will be to determine initial exchangeable sodium percentage, pH, and conductivity of soils being developed for irrigation. The sodium adsorption ratio, residual sodium carbonate, pH, conductivity, and total soluble salts of the irrigation water will also be determined. The above determinations will be repeated periodically for the duration of the project and records of irrigation water applied, rainfall, and cropping practices will also be maintained.

The resulting data will be analyzed and used to test the equations and their modifications as developed by Gapon and others and their application for estimation of exchangeable sodium percentage of equilibrium on soils being considered for irrigation development in South Dakota.

3.0435, BREEDING AND CULTURAL PRACTICES TO AID PRODUCTION OF VEGETABLES IN SOUTH DAKOTA

P. PRASHAR, South Dakota State University, School of Agriculture, Brookings, South Dakota 57007

a - The application of mist to cauliflower plants improved the quality and quantity of cauliflower heads. The mean temperature in the mist plots was reduced about 5.0 degrees F. The range of temperature reduction varied from 1 to 14 degrees F. A positive correlation of .76 was obtained between outside temperature and temperature under mist plots.

The mist lines (water lines) were 21 feet apart, and 6 1/2 feet high, and mist nozzles were 7 feet apart on each line. The pipe size was 1 1/2 inches for the main supply and 3/4 inches for laterals with the nozzles. On a hot day the mist system sometimes ran several hours at a time. The nozzles were adjusted so that each nozzle put out one- eighth of an inch of water per hour with water pressure at 40 pounds. The main water line was connected to a constant water supply. An electric solenoid valve was controlled by a thermostat set for a given air temperature. The mist came on automatically at that temperature and shut off as temperature fell below it. Under mist irrigation less water was required to produce better crops than when the crops were grown under sprinkler irrigation. The study is being continued in 1968.

b - An experiment at Redfield is being carried on to understand better relationships of various types of fertilizers and rate of water to produce high yields of potatoes under field conditions.

3.0437, CONTINUOUS COUNTERCURRENT EXCHANGE SYSTEM FOR REMOVAL OF CALCIUM, MAGNESIUM AND DISSOLVED OXYGEN FROM FEED WATER

I.R. HIGGINS, Chemical Separations Corp., Oak Ridge, Tennessee 37830

Previous work has been done using continuous countercurrent ion exchange to soften boiler feed water where the unique feature is the use of the boiler blowdown for regeneration. This is possible with brackish or saline water where there is enough salt content relative to the hardness to be removed that no new salt needs to be purchased. A Chem-Seps type continuous ion exchange unit capable of handling about 50 gpm sea water is to be tied in conjunction with a Baldwin-Lima Hamilton longtube evaporator. Sea water will be softened and fed to the evaporator blowdown and because of the removal of calcium scaling will be prevented in the evaporator. Evaporator blowdown will be fed back to the ion exchange unit and because of the higher salt concentration the ion exchange equilibria is shifted in a direction that will give more efficient removal of calcium which has been absorbed. The more calcium that is removed, the higher the degree of concentration of the evaporator blowdown, the higher the degree of blowdown concentration, the greater the removal of calcium. The experimental reference points that have already been established are 65 percent removal of calcium from sea water with a concentration factor of 3 in the blowdown. With a concentration factor of 5, there is greater than 90 percent removal of calcium.

A second phase of the study is to continuously remove dissolved oxygen. Reference for this work is an article in the Journal of Applied Chemistry, Vol. 7, November 1957 by E. C. Potter and G. Whitehead with a title, 'Continuous Removal of Dissolved Oxygen by Established Ion Exchanges.' This oxygen removal will be done in another continuous ion exchange unit associated with the softening unit. Ferrous sulfate is absorbed on an ion exchange resin and the ion precipitated with sodium hydroxide to form ferrous hydroxide within the resin bead. This ferrous hydroxide form resin is mixed with the softening resin so that calcium and oxygen are removed at the same time. The spent resin which has been converted to ferric is regenerated by adding acid to slightly solubilize ferric hydroxide and to strip it of the concentrated brine used to remove hardness. In laboratory studies this method of oxygen removal has been determined to be very effective.

3.0438, WATER RESEARCH PROGRAM III CORROSION

E.G. BOHLMANN, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee

The process of initiation of pitting corrosion of certain metals, particularly titanium, is being examined, with particular emphasis on the effects of electrode potential, chloride ion concentration, temperature, and alloy composition, in an effort to increase our understanding of factors responsible for the values and the temperature dependence of the pitting potentials of titanium and its alloys. The studies are being carried out with a small titanium loop equipped for carrying out electrochemical measure-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

ments to 225 degrees C. A similar Hastelloy C loop is being constructed for studies with solutions too aggressive for the titanium loop.

Studies on the crevice corrosion of titanium in saline waters at elevated temperatures are directed at developing an understanding of the mechanism of the attack and means of inhibiting or preventing it with alloy additions. The work thus far indicates an active-passive cell mechanism based on the formation of a concentrated, acidic (pH less than 1) chloride solution in the crevice. On this basis the alloy studies are being carried out in pH equal to or less than sodium chloride solutions at 100 degrees C.

3.0440, REACTIONS AND TRANSPORT PHENOMENA AT SURFACES

F.A. POSEY, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee (14-01-0001-931)

The process of initiation of pitting corrosion of certain metals, particularly titanium, is being examined with particular emphasis on the effects of electrode potential, chloride ion concentration, temperature, and alloy composition in an effort to increase our understanding of factors responsible for the values and the temperature dependence of the pitting potentials of titanium and its alloys.

Continuing studies on crevice corrosion are concerned with the kinetics of oxygen consumption and increase of acidity in crevices during the initiation period as a consequence of the rate of the corrosion reaction and of crevice geometry.

Novel electrode systems for carrying out reactions in flowing streams are being studied. Reactions of interest include redox processes, production of acid or base or chlorine, adsorption of ionic and molecular species from flowing solutions under controlled conditions for possible use in analysis and separations. Electrode systems of particular interest include new configurational variants which make use of porous electrodes in single compartment cells, thus eliminating the need for diaphragms in operation at high current densities. Other studies are concerned with the rectification properties of metallic electrodes at high current densities and with the development of special electrode assemblies for rapid and/or continuous analysis of components of sea water.

3.0441, WATER RESEARCH PROGRAM - SECTION IV. SEPARATIONS PROCESS

F.A. POSEY, U.S. Atomic Energy Commission, Oak Ridge National Lab., Oak Ridge, Tennessee

The separations process subprogram at present heavily emphasizes hyperfiltration (reverse osmosis), and in this area is particularly concerned with properties of membranes formed dynamically on porous bodies (pore sizes in the 0.15 micron range) by presence of certain additives in feeds. Films combining substantial salt filtration with high permeation rates are sometimes formed in this way. In addition, we are investigating boundary layer phenomena, particularly in order to understand the effects of buildup of solute at the membrane-feed interface during hyperfiltration and to develop turbulence promoters to ameliorate these effects.

3.0442, PROBABILITIES OF SEQUENCES OF DRY DAYS IN TEXAS

J.T. CARR, State Water Development Board, Austin, Texas 78711

Objective: To provide tables showing the probabilities of sequences of dry days of various lengths based on 1931 through 1960 precipitation records for Texas. These probabilities will be valuable in water supply planning, particularly as related to irrigation.

Approach: Precipitation records for Texas will be analyzed by computer to determine the empirical probabilities of sequences of dry days of various lengths. Separate probabilities will be determined for arbitrary definitions of a wet day as one in which precipitation is 0.01, 0.1, 0.20, 0.30, 0.40, 0.50, 0.70, 1.00, 1.50, and 2.00 inches. Actual computer work is being performed at Texas A&M University, College Station, Texas, using a program furnished by the U. S. Weather Bureau.

SUPPORTED BY Texas State Government

3.0443, PRELIMINARY FEASIBILITY AND ECONOMICS OF DESALTING BRACKISH WATERS IN CANDIDATE AREAS OF WEST TEXAS

H.D. HOLLOWAY, State Water Development Board, Austin, Texas 78711

Objective: To obtain information on the type and characteristics of desalting plants most suitable to the treatment of saline waters in West Texas and to compare the preliminary economics of desalting these saline waters with the alternative sources of water supply.

Approach: County groupings into six study areas based on similarity of present and potential water supply problems. Future water requirements and sources of supply evaluated. Saline water sources determined. Preliminary costs of desalted water determined for applicable desalting processes which included electrodialysis, reverse-osmosis, vacuum freeze-vapor compression, multistage flash distillation and vapor compressions-vertical tube evaporator distillation. Costs of desalted water include feedwater supply, feedwater pretreatment, desalting, brine disposal and desalted water conveyance. Desalted water cost for each study area compared with cost of water from all alternative conventional water sources available to each study area.

3.0444, IRRIGATION WATER MANAGEMENT FOR EFFICIENT WATER USE IN THE SOUTHERN PLAINS

J.T. MUSICK, U.S. Dept. of Agriculture, Bushland, Texas

Object: To develop methods and practices for efficient use of water supplies for irrigated lands involving: optimum use of limited irrigation water; soil moisture availability in relation to plant development; improved prediction of when and how much to irrigate; soil surface and profile modification for improved intake, transmission, and storage of water in the soil; and systems of design, including application method, equipment, flow hydraulics and management.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Plan of Work: Field plot and supporting laboratory studies, will be conducted in irrigated areas of the Southern High Plains and the Lower Rio Grande Valley. These studies will involve irrigation water management in relation to plant factors such as crops, cropping sequence, planting methods and dates, nutrient requirements, plant density, and plant development; soil properties that affect intake, transmission, storage, and distribution of irrigation water; systems design and management factors such as graded and level systems, alternate and every furrow irrigation, row grade, length of run, stream size, duration of application, timing of irrigations, automatic water control devices, reuse of runoff, application method, and distribution efficiency; factors relating to climate such as actual and potential evapotranspiration, soil water evaporation during noncropped periods, irrigation water requirements and need for and developing and testing of indicators for predicting when to irrigate, such as plant characteristics, soil factors, and use of climatic instrumentation and data.

Cooperation: Texas Agricultural Experiment Station; SCS; U. S. Bureau of Reclamation; soil conservation and irrigation districts, private agencies.

3.0445, GRADED FURROWS FOR RUNOFF AND EROSION CONTROL

R.W. BAIRD, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Numerous methods have been used to lessen the erosion in cultivated fields by runoff water. Most of the methods entail considerable installation cost and reduce the efficiency of farm equipment. Another method that has been used experimentally is maintaining ridges and furrows laid out on specified grade so that no furrow will receive runoff water except that falling in one row width. These furrows and ridges are maintained through the year by ordinary farm operations.

Graded furrows have been established with lengths of 340, 520, and 930 feet, and runoff and erosion measuring equipment installed. Information obtained will determine if this system is satisfactory for erosion and runoff control. It will also furnish the information needed for design and layout of this system.

Results from the first two years indicate good runoff and erosion control and crop yields have been equal to those with more conventional treatment. Only minor modifications have been required to adapt ordinary farm equipment to this practice. If some of the cultural problems involved can be effectively solved, this system should reduce the costs of farm operations on many fields where control of runoff water and erosion is a serious problem.

3.0446, CROP RESPONSE TO STATIC AND FLUCTUATING WATER TABLES

E.A. HILER, Texas A & M University System, School of Agriculture, College Station, Texas 77843

The objectives of this research are as follows: (1) To quantitatively determine the effect of static water-table level on crop response; (2) To quantitatively ascertain the effect of water-table fluctuations on crop response; (3) To quantitatively evaluate how soil salinity level affects optimum values determined in (1) and (2); and, (4) To evaluate other factors such as soil aeration status, soil temperature and moisture content, for use as drainage design criteria.

Field lysimeters will be utilized to determine quantitative results regarding drainage and irrigation requirements of grain sorghum and sugar beets. Undisturbed cores of characteristic sandy loam and loam soils of Texas will be utilized in the lysimeters. The lysimeters will be three feet in diameter and seven feet deep.

Crop response to static water tables of two, four, and six feet and a well-drained condition will be evaluated. Objective 4 will be considered during these tests. Fluctuating water-table experiments will be directed toward determining how fast the water table must be lowered from the surface to prevent reduction in potential crop production. Salinity studies will be initiated only

after achievement of satisfactory results regarding objectives 1 and 2.

A portion of the first year will be spent installing the lysimeter, the shelter, the weather station and auxiliary equipment. It is intended that the installation will be complete by the spring of 1968, so that the experiments with grain sorghum may be initiated at that time.

3.0447, FEASIBILITY OF THE ESTABLISHMENT OF PERMANENT SALINE-TYPE AGRICULTURE ON ALLUVIAL SOILS OF THE PECOS RIVER VALLEY OF TEXAS

D.E. LONGENECKER, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objective: 1. To determine the more immediate equilibrium effects of continued application of highly saline irrigation to Pecos River Valley soils on the following: a. The composition and concentration of soluble salts at various depths in the soil profile. b. The composition and ratio of adsorbed ions (sodium, calcium, magnesium and potassium) on soil exchange complex. 2. To determine the longer range or cumulative effects of application of these waters on soluble salts and exchangeable ions in these soils. 3. To determine the effect of supplementary additions of better quality water (possibly soil amendments) on the above soil chemical equilibriums. 4. To correlate the effects of irrigation water management and control practices on rate and degree of soil salinization. 5. to determine the germination, growth, production and longevity of certain salt tolerant grasses, legumes, field crops grown on these soils and irrigated with saline pump waters. 6. To continue to evaluate and select highly salt tolerant grass, legume and field crop varieties and strains as to their suitability for hay, pasture or crop production on these saline soils.

3.0448, VARIABLE ROW SPACING AS A MEANS FOR REDUCING COSTS AND CONSERVING WATER IN IRRIGATED COTTON PRODUCTION

D.E. LONGENECKER, Texas A & M University System, Graduate School, College Station, Texas 77843

Objectives: 1. To evaluate a new system of variable-row cotton spacing, and to compare yields and cost reductions with normal planting systems. 2. To study physiological implications of the new system, including varietal response, plant growth, boll characteristics and fiber properties, as compared with current systems. 3. To investigate agronomic and engineering aspects of the system, including plant spacing, fertility, water requirements, need for cultivation and weed control, and changes in design of mechanical harvesting equipment. 4. To determine the effect of the new system on the incidence of cotton diseases, primarily Verticillium wilt and bacterial blight.

Variable row spacing is herein defined as an alternate 26-54 inch row spacing, with narrow furrows between the 26 inch rows for less total water application, reduced evaporation rates, better water utilization efficiency by the crop, and better weed control. The 54 inch spacing constitute wide double row beds. Comparisons would be made with standard 38-40 inch evenly spaced rows, the current planting method.

SUPPORTED BY Texas State Government

3.0449, THE EFFECT OF BENCH LEVELING AND CONTRIBUTING WATERSHED AREAS ON SOIL MOISTURE STORAGE AND CROP YIELDS IN THE ROLLING PLAINS

P.T. MARION, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Project Objectives and Description of Work Proposed: A. To evaluate the practice of dryland bench leveling on Abilene and Tillman clay loam soil as related to: (1) water storage and use by cotton and other selected field crops, (2) yield and quality of cotton and other crops. B. To determine the feasibility of using contributing watersheds to bench leveled land as an additional source of water. C. To determine the correct spacing of leveled land as an additional source of water. C. To determine the correct spac-

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

ing of level borders for maximum conservation of water consistent with cost and yield. D. To determine the economic feasibility of a dryland level-border system by maintaining cost records and relating such cost to yield increases.

Previous work at Spur and other locations has shown a potential benefit from bench leveling in water retention, runoff distribution, and crop yield. Measurements and determinations will be made on moisture, yield, and soil physics. Costs will be determined for each treatment.

3.0450, INTERROW WATERSHEDS AS A MEANS OF INCREASING RAINFALL EFFICIENCY

J.R. MULKEY, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: a) To compare moisture utilization of cotton planted in skip row systems with solid planted cotton. b) To investigate the feasibility of establishing interrow watersheds in skip-row planted cotton as a means of diverting additional water into the root zone of growing plants. c) To evaluate the use of chemical and physical barriers which retard or restrict water infiltration as a means of establishing efficient interrow watersheds. d) To evaluate the potential of using interrow watersheds in wide row spaced vegetable crops as a means of producing vegetables on nonirrigated soils in the Rolling Plains of Texas.

Work Proposed: Interrow watersheds are herein defined as the unplanted areas in skip-row planted crops or the unplanted area between rows in crops planted in wide row spacing. The full potential of diverting rainfall from these areas onto growing crops will be evaluated. A screening process will be used to select chemical and physical barriers to be used in such a system from both the standpoint of efficiency and cost.

3.0451, CONSERVATION AND UTILIZATION OF RAINFALL AND IRRIGATION WATER

J.S. NEWMAN, Texas A & M University System, Agricultural Experiment Sta., College Station, Texas 77843

Objectives: (1) To determine the influence of slope under different moisture levels on the following: runoff, subsurface moisture content and distribution, irrigation efficiency, and crop production. (2) To determine the influence of conservation practices including level, side-slope, and graded benches, field leveling, and parallel terrace on runoff, subsurface moisture content and distribution, crop yields and irrigation efficiency. (3) To determine cultural practices necessary to restore high yields capabilities in cut and fill areas resulting from land forming.

This project deals with the influence that slope, land forming and irrigation practices have on more efficient utilization of rainfall and irrigation water, soil productivity and crop yields.

3.0452, THE ECONOMICS OF IRRIGATED CROP PRODUCTION BY LOW CAPACITY WELLS AND BY SPRINKLER SYSTEMS ON TEXAS FARMS

J.S. WEHRLEY, Texas A & M University System, School of Agriculture, College Station, Texas 77843

Three alternative water management programs for a typical resource situation in an area of the Texas High Plains where water supplies are becoming critical were analyzed. A program which maintained constant acreage by increasing irrigation facilities to compensate for declining water levels was found to be uneconomical. Even though this program most nearly reflects the historical changes that have occurred in the water management programs and the average annual rate of static water level decline in the area, it would result in excessive unrecovered investment at the end of its economic life.

A water management program of maintaining only existing wells and equipment would utilize the existing water resources over the longest time period but also leave unrecovered investment when the economic life of the irrigation water is exhausted according to the depreciation assumptions used. A program

under which new irrigation facilities would be purchased only when the investment could be recovered in a four year period would result in the last unrecovered investment, the highest return to labor and water and the greatest net returns.

The complete results of this analysis are being detailed in a Master's thesis. This analysis presented the two logical extremes of irrigation water utilization in Subarea 3-3 and guidelines for a program which would obtain the optimum economic returns over the life of the water resources. The results will be extremely valuable to producers in the area who must decide on their future irrigation program under declining water levels.

3.0453, ASSEMBLY AND EVALUATION OF AN IMPROVED PPB OXYGEN ANALYZER FOR SEA WATER

H.C. BEHRENS, Dow Chemical Company, Freeport, Texas (14-01-0001-1832)

This program will consist of the development and proving of an on-stream oxygen analyzer with an automatic calibrator to form a system with a capability for accurate dissolved oxygen measurement in the range of 0 to 10 parts per billion for sea water application.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0454, SEAWATER CORROSION CONTROL BY ENVIRONMENT MODIFICATION

R.A. LEGAULT, Dow Chemical Company, Freeport, Texas

This program will consist of a laboratory study to explore the possibility that environmental changes can be employed to permit the economic use of steel or aluminum as materials of construction for heat exchanger surfaces in desalination plants. The environmental variables to be examined in this study are as follows: pH, concentration of dissolved oxygen, heavy metal ion concentration, and the addition of a variety of corrosion inhibiting materials. The environmental changes which appear most promising in static corrosion tests will then be studied under dynamic conditions.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0455, SEA WATER CORROSION TEST PROGRAM

L. RICE, Dow Chemical Company, Freeport, Texas (14-01-0001-2150)

The program will consist of a 19-month study having the basic purpose of developing a better understanding of the interaction of metals with sea water environments, particularly under the conditions of temperature, pH, dissolved gases, concentration, and chemical treatment encountered in distillation-type desalination plants. This contract is a continuation of Contract No. 14-01-0001-1090.

3.0456, A STUDY OF HEAT TRANSFER IN THE FLUTED VERTICAL TUBE EVAPORATOR

L.C. ELLIOTT, Houston Research Institute, Houston, Texas

The General Electric double fluted tube has shown promise for use in distillation type desalting plants. Measurements of average individual heat transfer coefficients, pressure drop and entrainment are being made on a 3 in. nominal diameter by 10 ft. long fluted tube. Pressure levels for the evaporation side range from 26 in. Hg vacuum to 1 atm. The results have shown that the condensing heat transfer coefficient is about five times higher than the evaporation heat transfer coefficient. Additional studies will further define the effects of: a. sea water versus fresh water; b. baffling to give induced interfacial shear on the evaporated side; c. presence of air in the condensing steam; d. reduction in diameter of the tube.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0457, INSTALLATION OF INSTRUMENTATION FOR CLAIR ENGLE PLANT

R.J. SILBERMAN, Houston Research Institute, Houston, Texas

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Highly accurate instrumentation with data acquisition and computer hardware is being installed in a flash evaporator desalination plant. The purpose of the system is to provide equipment for fast data retrieval and for calculation of the performance characteristics of horizontal tubular exchangers in the plant. Specially designed RTD temperature probes are installed inside and outside of the exchanger tubes. Flowmeters monitor production of exchanger sections being investigated. Absolute and pressure differential instruments further define operating conditions. Other installed equipment enables the investigator to get supplementary information such as flow profiles across exchanger tubes and process and product troughs; pressure profiles in vapor channels; gas analyses at particular vessel vapor points; and data on plant process operating conditions. Approximately 450 points of data are scanned through a multiplexer at a rate of 10 per second, or sampled individually. The data may be displayed digitally or printed out on a teletype. It is anticipated that the system be utilized for other program controlled investigations of plant operation.

3.0458, FUNDAMENTAL STUDIES IN METASTABLE FLASHING FLOW

A.E. DUKLER, Univ. of Houston, School of Engineering, Houston, Texas 77004

This is an investigation to determine the variables governing flash vaporization under flowing conditions. Studies will be made to characterize flow and phase distribution in flashing devices, and the effects of the geometry of the flashing device on flow and mass transfer will be evaluated. The results are expected to contribute to the understanding of metastable flashing flow and to the design of more efficient devices for flash evaporation.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0459, THEORETICAL AND EXPERIMENTAL STUDIES OF TURBULENCE AND MIXING NEAR ROUGH SURFACES

F.L. WORLEY, Univ. of Houston, School of Engineering, Houston, Texas 77004

The objective of this investigation is to obtain experimental data regarding the turbulence and mixing characteristics in flow adjacent to a rough surface. These data will be obtained by using a new type laser anemometer which will permit the study of the turbulence properties closer to the rough surface than has ever been possible before. In addition this new system will be used to measure for the first time correlation coefficients which describe the turbulent mixing and energy dissipation process.

These data will be used to obtain a better understanding of the role of surface roughness in the mechanism for turbulent energy dissipation and should lead to techniques for predicting this quantity as well as the allied problems of mass and thermal energy transport.

3.0460, THE MINERALOGY AND CHEMISTRY OF SOILS AND SEDIMENTS OF HIGH PLAINS PLAYAS

B.L. ALLEN, Texas Technological College, Water Resources Center, Lubbock, Texas 79409

Almost all of the runoff water of the interior High Plains of Texas and New Mexico collects in shallow enclosed depressions called playas. Probably very little of the collected water percolates into the important aquifer, the Ogallala formation, because of the very low permeability of the playa floor soils. Apparently, most of the water evaporates. The mineralogy and certain chemical properties of the clays in the soils and sediments from playas selected according to soil type and topography will be determined. They will be related to similar properties of surrounding soils. Similar determinations will be made of material suspended in the playa water. These data are needed for the proper design of mechanical filters or for the removal of sediment by chemical flocculation in developing effective recharge systems. Additionally, the information will be beneficial in the modification of playas to concentrate water for irrigation, wildlife habitats, sewage effluent storage, and mosquito control.

Standard techniques, including X-ray diffraction, differential thermal, and infrared absorption will be used to study the clays. Absorption and emission spectrophotometric determinations will be made of the soil water and adsorbed cations. The effects of the clay mineralogy and chemistry upon soil permeabilities will be evaluated.

3.0462, RELATION OF CLIMATIC AND WATERSHED PHYSIOGRAPHIC AND CULTURAL FACTORS TO WATER YIELD

R.W. BAIRD, U.S. Dept. of Agriculture, Temple, Texas

Object: To identify the climatic and watershed factors influencing water yield from agricultural watersheds, to evaluate the factors quantitatively; and to develop simple field procedures by which seasonal, annual, and long period yield of water for ungaged watersheds may be reliably estimated.

Plan of Work: The work is currently concentrated on a segment of the Wishita River Watershed in the vicinity of Chickasha, Oklahoma; on small agricultural watersheds near Stillwater, Oklahoma; at the Blacklands Experimental Watershed, Riesel, Texas; and on Lowrey Draw at Sonora, Texas. Some of the factors required for the analyses and which are measured or otherwise documented for the study are: rates and duration of streamflow; precipitation patterns; antecedent moisture; season soils; land use; conservation and watershed management practices; ground water elevations; riparian vegetation; geology; gradients and hydraulic roughness of stream channels, and the size, shape, and other geomorphic attributes of the watersheds. The downstream effects on flow regimes associated with improvement works in upstream tributaries is a primary phase of the study on the Washita River Watershed.

SUPPORTED BY U.S. Dept. of Agriculture

3.0463, STRUCTURE AND MORPHOLOGY OF INORGANIC MEMBRANES

W.O. MILLIGAN, Baylor University, Graduate School, Waco, Texas 76703

A detailed investigation of the structure and morphology of inorganic membranes, particularly semi-permeable membranes such as the classical cupric ferrocyanide membrane, is being undertaken using x-ray diffraction, electron diffraction, electron microscopy, and dehydration isobaric methods.

Electron microscopic studies of the freshly precipitated cupric ferrocyanide confirm that the gel is a finely-divided precipitate containing particles in the range of 10 to 20 Å. Upon further aging in distilled water for a period of 48 hours or more, cupric ferrocyanide will form very thin sheets several hundred Å units in cross-section. With the appearance of this sheet material, several new lines appear in the electron diffraction pattern and in the x-ray diffraction pattern, indicating a larger unit cell. (A detailed structure analysis of this larger unit cell is underway.) These large spacings appear and disappear as a function of water content, thus indicating a possible water transport mechanism thru the crystals.

At the present time, crystal structure and aging studies are being carried out on some thirty or more heavy metal ferrocyanides, ferricyanides, and cobalticyanides which are isomorphous with cupric ferrocyanide.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

Series of these inorganic substances giving both the large and small unit cell will be made into support membranes and tested for semi-permeable properties. The results of such experiments may be helpful in formulating a transport mechanism for the desalting of water through the use of inorganic semi-permeable membranes.

3.0464, INFLUENCE OF TRANSPIRATION SUPPRESSANTS, SPRINKLER IRRIGATION & MOISTURE LEVELS ON TRANSPIRATION & EVAPOTRANSPIRATION

C.J. GERARD, Texas A & M University System, Agricultural Experiment Sta., Weslaco, Texas

Water is one of our most important resources and is often a limiting factor in irrigation areas. Past research indicate that in an irrigated agriculture conservation of water, as much as 25% can be achieved by applying less water and applying water to plants during their critical demand periods. The proposed research project plans to determine if significant reduction in water requirement can be achieved by modifying the microclimate in the plant canopy. The use of transpiration suppressants and sprinkler irrigation may offer opportunities to modify the microclimate and therefore reduce transpiration and evapotranspiration.

Field experiments with tomatoes and citrus will be conducted to determine the influence of transpiration suppressants (reflective coatings), sprinkler irrigation and moisture levels of evapotranspiration and microclimate of plant canopy. The influence of the above treatments on transpiration will be evaluated using a thermoelectric method under field and controlled chamber conditions.

3.0465, SPECTRAL RECONNAISSANCE FOR DIAGNOSIS OF SOIL AND WATER MANAGEMENT PROBLEMS

V.I. MYERS, U.S. Dept. of Agriculture, Weslaco, Texas

Object: To determine mechanisms affecting reflectance from plant and soil surfaces and the interactions of environmental conditions with reflectance using multispectral techniques; and to develop diagnostic procedures for laboratory and field use by remote sensing.

Plan of Work: This work will be conducted first in the laboratory and greenhouse to determine the consequences of such factors as salinity, drought, toxic ions, disease and fertility levels to the physiological and morphological characteristics of internal plant tissue. Plant and soil conditions which may result in markedly different spectral reflectance will be established under controlled conditions that will include different levels of soil moisture, salinity and fertility, disease incidence, and presence or absence of toxic salts or growth regulator chemicals. Cotton will be used as the indicator crop during the first studies but other biological materials will be subsequently used. The second phase of the work will include field plantings under different environmental and biological conditions as indicated by the laboratory studies. This will be followed by aerial flights over the fields using multispectral sensing equipment and techniques for the development of predictive procedures.

Cooperation: Texas Agricultural Experiment Station, Soil Conservation Districts in the Lower Rio Grande Valley, National Aeronautics and Space Administration, Department of Defense, SCS.

SUPPORTED BY U.S. Dept. of Agriculture

3.0466, SALINE AND SODIC SOILS AND IRRIGATION WATER QUALITY PROBLEMS IN THE RIO GRANDE RIVER BASIN

C.L. WIEGAND, U.S. Dept. of Agriculture, Weslaco, Texas

Object: To study the distribution and quantity of salts and exchangeable cations in soils as affected by leaching, water quality, drainage and management practices; to evaluate the effectiveness of practices for removal of soluble salts and exchangeable sodium; to determine the effects of the salinity and sodium status of

soils on plant growth; and to develop cultural and soil management systems to improve growth, production and quality of crops grown on saline and sodic soils.

Plan of Work: Various cultural, irrigation, drainage, and amendment practices will be conducted to displace or replace soluble salts and exchangeable sodium from soils with leaching water or by other processes. Changes in salt and sodium status of soils under study will be determined by chemical analyses. Soluble salt and exchangeable sodium content in problem areas will be investigated in relation to water quality, water table height, precipitation, topography, and farming practices with subsequent derivation of statistical and graphical relationships. Various crops and varieties of crops will be grown on soils of different levels of salt and exchangeable sodium to determine the effects of salt and sodium on crop yield and quality. Quantitative relationships between yield reduction and the salt and sodium status of soils will be developed.

Cooperation: Texas Agricultural Experiment Station; U.S. Salinity Laboratory; soil conservation districts.

3.0467, THE TRANSPORT OF SALTS AND WATER ACROSS A CATION EXCHANGER UNDER A GRADIENT OF HYDROSTATIC PRESSURE.

P. MEARES, Univ. of Aberdeen, Aberdeen - Old Aberdeen, United Kingdom

Very little work has been published on transport across ion exchange membranes under a mechanical pressure gradient. It is proposed to study the rates of flow of water, and the streaming potentials and streaming currents across a phenol sulphonic cation exchange membrane in contact with solutions of sodium, strontium and caesium bromides.

The mechanical transference numbers of the ions in the resin will be measured by observing the movement of radio tracers along a strip of membrane to one end of which a high pressure is applied.

By combining a pressure gradient with other force fields it is hoped to examine some of the unstable and oscillatory flux phenomena which have been reported recently.

The data will be combined with the information already secured on this membrane in contact with these electrolytes when acted on by other force fields. This will allow a rigorous test of the non equilibrium thermodynamic theory of membrane transport.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0468, NEW SYNTHETIC MEMBRANES FOR REVERSE OSMOSIS DESALINATION

A. SHARPLES, Arthur D. Little Research Inst, Midlothian - Scotland, United Kingdom

Previous studies in our laboratories have shown that copolymers based on galactose methacrylate, and methyl methacrylate show promise in connection with the formation of membranes for reverse osmosis. The present project is concerned with optimizing the system in order to obtain high throughput products.

In addition, two new systems are being studied. The first uses glyceryl methacrylate as the hydrophilic component to replace galactose methacrylate. The second uses vinyl carbazole as the hydrophilic component, in order to obtain a high resistance to compaction.

3.0469, ANALYSIS OF DESALTING PLANTS AS A SOURCE OF SUPPLEMENTAL SAFE YIELD

C. CLYDE, Utah State University, Utah Water Research Laboratory, Logan, Utah 84321 (14-01-0001-1711)

The objectives of this study are to develop a computer program using a methodology consistent with techniques and methods now being used to assess natural water supply systems to (1) determine the optimum fashion in which to operate desalting plants to provide supplemental safe yield; (2) assess impact of

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

such operation on the performance characteristics and design of a desalting plant used in this service, as well as in the identification of unique operating features of the plant.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0470, OPTIMIZATION IN THE USE OF VARIABLE QUALITY DESALTED WATER AND AN ARTIFICIAL UNDERGROUND RESERVOIR TO SUPPLY PEAK MUNICIPAL WATER DEMANDS

R.N. DEVRIES, Utah State University, School of Engineering, Logan, Utah 84321

The objective of this research is to develop a mathematical model of a municipal water supply system that includes a supply source from a variable quality output desalting plant to be used in conjunction with an artificially recharged underground aquifer reservoir.

Testing of the model will be done on an actual situation, namely that of supplying the City of Lincoln, Nebraska with additional water to meet its future demands.

Three methods of desalting are being considered. These are: total distillation, electrodialysis, and reverse osmosis. These were chosen since the study is limited to the desalting of brackish ground water available in inland cities.

Optimization techniques, such as linear, non-linear and dynamic programming will be used in completing the study.

SUPPORTED BY Utah State Government
Utah State University

3.0471, EVALUATION OF FIVE METHODS FOR SAMPLING DESERT AND WETLAND VEGETATION

N. FOLKS, Utah State University, State Coop. Wildlife Res. Unit, Logan, Utah 84321

Five vegetation sampling methods--the point-frame transect, the 100-square-foot plot, the 0.20-square-foot plot, and the step-point, estimation-plot method--will be compared on three different ecological types. Comparisons will be made on Desert Shrub-Grass Polygonum-Marsh, and Eleocharis-Marsh types.

This work is to be done on the Ouray National Wildlife Refuge in northeastern Utah and on the Monte Vista National Wildlife Refuge in southwestern Colorado.

At the Ouray Refuge, two cover types will be chosen for study due to ecological position and uniformity of vegetational composition. One study area will be located on a dry sandy bench, the other in a moist river clay-loam flood bottom commonly called a river oxbow. A third cover type will be located at the Monte Vista Refuge because of its ecological position and uniformity of vegetation at a higher elevation.

Utah State University

3.0472, IRRIGATED PASTURE AND MEADOW ESTABLISHMENT AND MANAGEMENT

W. KELLER, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Object: To develop high producing grass-legume mixtures for irrigated pastures, dependable procedures for establishing them, and management practices to insure maximum productivity; to determine effective management practices for flood meadows, including methods for destroying the native sod and establishing more productive species.

Plan of work: Irrigated pasture studies will include methods of establishing various combinations of grasses and legumes in replicated plots seeded at different seasons, using different types of seedbed preparation, with and without companion crops, with varying amounts and frequencies of irrigation water and fertilizer. If possible, plots will be harvested by grazing animals but the vegetation will be sampled to measure dry-weight yields, obtain chemical analysis and botanical composition. Climatic and environmental characteristics will be documented and all management practices accurately standardized in order to project experience to areas not experimented upon. Studies on flood irrigated meadows will include management of existing vegetation

for greater forage yields (regulation of water, introduction or management to increase legumes, fertilizer treatment, harvesting at different stages to determine proper stage for maximum nutrient yield, etc.). Search will be continued for means of destroying existing sod and replacing it with high-production species.

SUPPORTED BY U.S. Dept. of Agriculture

3.0473, FARM CONVEYANCE AND WATER APPLICATION

C.W. LAURITZEN, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: To develop 1. Improved methods of conveying water on the farm. 2. Improved methods of applying water to the land.

Work Proposed: The design, development, and testing of conveyance, diversion, and application structures will be undertaken. Emphasis will be on new materials such as butyl and plastics, but not necessarily confined to these, and will include both surface and overhead applications.

SUPPORTED BY Utah State Government

3.0474, THE IMPROVED USE OF WET AND SALTED SOILS FOR FORAGE PRODUCTION

H.B. PETERSON, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

To improve production on the wet and salted soils of the state by: (1) reclamation methods adapted to the special conditions on marginal lands. (2) finding cultural practices that will improve the soil conditions for plant growth and minimize the adverse factors. (3) a physiological study to determine how salts and exchangeable sodium in soil adversely affect plants.

The field studies will be conducted in Cache Valley on an experimental drainage farm where such things as salt removal by special techniques, mole drains, species performance, soil amendments, etc. can be evaluated.

SUPPORTED BY Utah State Government

3.0475, UNDESIRABLE SHRUB AND TREE CONTROL

G.A. VANEPPS, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objective: To develop economical and effective methods in controlling certain low use undesirable shrubs and trees that may be high users of water.

Work Description: Study sites will be obtained on private, state and federal lands located in Central Utah. Initial stages of the study will deal with Gambel oak (*Quercus gambellii*), with aspen, chokecherry and others included later. Treatments will be chemical herbicides, mechanical and fire or combinations, with major emphasis on herbicides. Herbicide treatments to include various chemicals, rates, times and methods of application, such as foliar, basal and soil treatments. Climatic and soil data will be obtained. Data will be gathered on plant regrowth, top kill, total kill, or other abnormal symptoms arising from the various treatments.

SUPPORTED BY Utah State Government

3.0476, VEGETATION AND SOIL RESPONSE TO SOIL SURFACE TREATMENTS

N.E. WEST, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

Objectives: To determine the effects of pitting and contour furrowing on productivity and vigor of vegetation, temperature microclimates, soil moisture economy, and erosion reduction.

Description: Paired plots on previously treated and untreated areas of shadscale zone rangeland will be evaluated for response of production and vigor of vegetation, temperature microclimate, soil moisture and erosion control. Economic evaluation of these practices will also be attempted.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

SUPPORTED BY Utah State Government

3.0477, DESIGN FACTORS IN SURFACE IRRIGATION
L.S. WILLARDSON, Utah State University, Agricultural Experiment Sta., Logan, Utah 84321

1. To determine the effect of furrow stream sizes on irrigation efficiencies. 2. To determine the magnitude of seasonal infiltration variations on some classified soils. 3. To develop a relation between infiltration as measured in furrows and by infiltration cylinders.

Work will be done to develop a method of accurately measuring the amount of water absorbed along a furrow at different times. Knowledge of the amounts being absorbed in various reaches of the furrow is required. Present methods of measuring water will be considered for their adaptability to the problem. When a satisfactory method has been developed it will be tested in the field. Water distribution patterns along furrows will be determined. The effect of furrow stream advance rate and of irrigation duration on water application efficiency will be determined. Analyses, using electronic computer techniques will continue on data already collected for objective No. 3. Further collection of data in the field may be required to check equations developed.

3.0478, LEACHING AND RECOVERY OF COPPER FROM ORES AND WASTE DUMPS

J.B. ROSENBAUM, U.S. Dept. of Interior, Metallurgy Research Ctr., Salt Lake City, Utah 84112

Study and determine major factors that contribute to mechanisms of heap leaching copper oxide or silicate ores. Seek means of expediting extraction. Also seek methods of improving leachability of sulfide-type ores. Investigate improvements in the recovery and processing of cement copper from leach liquors to obtain a usable finished product.

SUPPORTED BY U.S. Dept. of Interior - Bureau of Mines

3.0479, STUDY OF BIOLOGICAL DESALINATION PHENOMENA AND SALT TRANSPORT MECHANISMS OF SELECTIVE AVIAN SALT GLANDS

J.M. SPURLOCK, Susquehanna Corporation, Alexandria, Virginia 22314

The program includes two major phases. The first phase consists of an analytical study of various biological ion transport systems and, based upon results of recent research on these systems, new approaches or concepts will be defined for the application of these research results to the development of new or improved practical desalination processes. The second phase involves an investigation to elucidate the salient mechanisms and structural characteristics associated with selective ion transport by the avian salt glands of white china geese as a specific biological model related to sea gulls. Included in the second phase is the development of techniques for handling and assaying salt gland membranes from white china geese.

SUPPORTED BY U.S. Dept. of Interior - Off. Saline Water

3.0480, DEVELOPMENT OF ECONOMICAL METHODS OF BORON REMOVAL FROM IRRIGATION RETURN WATERS

E.W. DUNKLIN, Melpar Inc., Falls Church, Virginia

The primary objective of this program is to develop economical methods of boron removal in irrigation return waters for subsequent use in multi-million gpd capacity reverse osmosis plants. Under the scope of work, the effectiveness of conventional water pre-treatment methods for boron removal using a synthetic irrigation return water will be investigated and laboratory tests to develop new methods of boron removal will be conducted. Cost estimates for each method will also be made. The two or three most promising methods will be selected for field evaluation and design drawings for the construction of a test unit will be prepared.

3.0481, DEMONSTRATION OF ALUMINUM IN SEA-WATER DESALTING

D.A. FAUTH, Reynolds Metals Company, Richmond, Virginia (14-01-0001-1095)

To design and build a 50,000 gpd flash distillation desalination unit for evaluating the performance and to determine the useful life of aluminum alloys as the material of construction for the heat exchanger tubing in this environment. The unit is built using carbon steel flash chambers and 3003, 5052, 6061, and 3004 clad aluminum tubing. The water boxes, interstage partitions, tube sheets, degassifier, and deaerator are made of 6061 aluminum. The aluminum components are isolated from electrical contact to the steel. The unit is designed for automatic operation and has a top brine temperature of 250 degrees F. The design is conventional flash distillation process with 24 heat recovery and two heat reject stages. Sulphuric acid is used for scale control. Corrosion probes are located throughout the plant for recording instantaneous corrosion rates. The water boxes can be removed for inspecting the internal surfaces of the aluminum tubing by use of a borescope. Top and side access covers can be removed for inspection of the external surfaces.

3.0482, FACTORS AFFECTING WATER CONSERVATION FOR PLANT GROWTH IN THE LOW RAINFALL AREA OF EASTERN WASHINGTON

F.E. KOEHLER, Washington State University, School of Agriculture, Pullman, Washington 99163

Objectives: 1. To identify and determine the significance of factors affecting moisture intake and retention of soils of the low rainfall area of Eastern Washington with special reference to moisture in the seeding zone. 2. To determine moisture movement in the soil during the fallow year and crop year of summer-fallow cycle, as affected by initial soil moisture level and by fall and spring density and depth of loose topsoil. 3. To correlate moisture in the seeding zone with density of the surface and sub-surface soil as established by various tillage treatments.

Soil moisture level will be followed through the fallow and growing season in the dry area of eastern Washington (10 inches annual precipitation). The influence of different tillage practices during the fall after harvest and in the spring of the fallow year will be studied. Special emphasis will be placed on the soil moisture level in the seeding zone.

3.0483, THERMODYNAMICS AND TRANSPORT PROPERTIES OF MULTICOMPONENT INTERFACES

J.C. BERG, Univ. of Washington, School of Engineering, Seattle, Washington 98122

The primary objectives of the proposed work are to measure and to correlate thermodynamic and transport properties associated with monolayer surfactant films at interfaces separating multicomponent bulk phases. Thermodynamic data will be obtained as interfacial pressure vs. molar area isotherms, and these will be correlated using models suggested by statistical mechanics. Transport data, i.e., surface viscosity and perhaps other rheological properties, together with surface diffusivity will be obtained for a number of multicomponent bulk systems. Both the thermodynamic and the transport data will be put to use in formulating the fluid mechanical boundary conditions which are required to describe the influence of surfactants on many of the common fluid-fluid separation processes such as distillation, absorption, and extraction.

3.0484, EFFECTS OF FOREST COVER MANIPULATION ON WATER YIELD AS STUDIED BY AN ELECTRIC ANALOG

S.P. GESSEL, Univ. of Washington, Graduate School, Seattle, Washington 98122

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

The proposed research would establish electric analogy models for study of the impact of forest cover manipulation on water yield for certain soils, forest types and climatic zones in Washington State. Such model studies could also evaluate the influences of combinations of precipitation and temperature extremes in addition to varying densities and ages of forest stands. If studies of this nature are successful, the need for expensive experimental watershed studies would be greatly reduced and the results of such studies would be more useful.

3.0485, NATURAL RESOURCE MANAGEMENT AND CONSERVATION IN THE SOVIET UNION

P.R. PRYDE, Univ. of Washington, Graduate School, Seattle, Washington 98122

The dissertation is intended to serve as a survey of the present status of natural resource conservation in the Soviet Union. Water resources will be a major, though not the only, theme. At least one full chapter will be devoted to the utilization and conservation of water resources. A primary focus of the sections on water resources will be the manner in which Soviet planners have handled the uses of a given resource complex, externalities, etc. Sections of other chapters will deal with pollution, fisheries, marshland, drainage, and other associated problems. It is expected that the dissertation will be completed in the spring of 1969.

3.0486, WATER YIELD IMPROVEMENT, EROSION CONTROL, AND SEDIMENT REDUCTION IN FORESTS

H.W. BERNDT, U.S. Dept. of Agriculture, Wenatchee, Washington

Object: To determine how moisture disposition and use are influenced by environment, climate and types of vegetative cover and soil; to relate erosion to soil, vegetation, topography, climate, and land use; and to devise ways to improve water yield, and prevent erosion and restore land stability in the mixed-conifer and forest range types.

Plan of Work: The project will continue: (1) to study erosion rates in major soil types, to analyze the characteristics of soil that affects erosion, and to develop methods of erosion control by invigorating vegetation; and (2) to investigate factors affecting distribution and use of water: solar-energy, soil, moisture, evapotranspiration, surface runoff, riparian use, and humus types. Recent work includes use of radioactive tracers to tag soils to measure downslope movement, studies of nutrient levels of soils and fertilization, soil densities relating to root systems and water absorption, water movement through juvenile plants, and snow accumulation and melt rates.

3.0487, DEVELOPMENT OF THE VACUUM FREEZING VAPOR COMPRESSION PROCESS FOR USE WITH BRACKISH WATERS

R.R. BRIDGE, Colt Industries Incorporated, Beloit, Wisconsin

The vacuum freezing vapor compression process is based on freezing by flash evaporation, with compression of the vapor and subsequent condensation on ice which has been cleaned of brine in a counter-washing column. A 60,000 gpd pilot plant has been in operation at Wrightsville Beach, N.C., during FY 1966 and will operate into FY 1967 and possibly into FY 1968. A mobile unit using the process will be built during FY 1967 and operated in FY 1968 on brackish water to determine its applicability for use on such waters.

3.0488, SPRING POND ECOLOGY AND MANAGEMENT

O.M. BRYNILDSON, State Div. of Conservation, Madison, Wisconsin 53701

Objectives: To determine the effectiveness of dredging spring ponds as a trout habitat management practice and develop management guidelines; to describe the biological, chemical, and physical characteristics of spring ponds; to determine the cost-benefit ratio in terms of trout production and angling quality.

Procedures: Ponds will be mapped and sounded and extent of various substrates determined. Peterson type population estimates of the fish population will be made by means of electro-fishing gear in spring and fall in both the pond and a section of the out-flowing stream immediately below the pond. Angler harvest will be determined by a stratified contact-type creel census throughout the season. Growth rate and age-class composition of trout will be determined by scale analysis, to be supplemented in later years by measurements of marked known-age fish. Two-way weirs will be installed to determine the extent of fish movement into and out of the pond.

Recording thermometers will be installed in the ponds at the outlets, and in the open area of the ponds, and periodic vertical thermal-chemical analyses will be made.

Water stage recorders will be installed at spring pond outlets to determine outlet volume and to detect changes attributable to dredging. Test wells will be driven in the vicinity of the ponds to determine changes in ground water levels. The cooperation of the U.S.G.S. will be sought on this phase of the project.

Pre- and post-dredging sampling of bottom fauna will be undertaken, probably under contract with the University of Wisconsin.

Three to four ponds will be included under the dredging phase of this study and one to two ponds, which presently are considered to support a good trout population and provide satisfactory angling (i.e., not proposed for dredging), will be included as reference ponds.
